At Oxford Johnson resided during about three years. He was poor, even to raggedness; and his appearance excited a mirth and a pity which were equally intolerable to his haughty spirit. He was driven from the quadrangle of Christ Church by the sneering looks which the members of that aristocratical society cast at the holes in his shoes. Some charitable person placed a new pair at his door; but he spurned them away in a fury. Distress made him, not servile, but reckless and ungovernable. No opulent gentleman commoner, panting for one-and-twenty, could have treated the academical authorities with more gross disrespect. The needy scholar was generally to be seen under the gate of Pembroke, a gate now adorned with his effigy, haranguing a circle of lads, over whom, in spite of his tattered gown and dirty linen, his wit and audacity gave him an undisputed ascendency. In every mutiny against the discipline of the college he was the ringleader. Much was pardoned, however, to a youth so highly distinguished by abilities and acquirements. He had early made himself known by turning Pope's Messiah into Latin verse. The style and rhythm, indeed, were not exactly Virgilian; but the translation found many admirers, and was read with pleasure by Pope himself.

The time drew dear at which Johnson would, in the ordinary course of things, have become a bachelor of arts; but he was at the end of his resources. Those promises of support on which he had relied had not been kept. His family could do nothing for him. His debts to Oxford tradesmen were small indeed, yet larger than he could pay. In the autumn of 1731 he was under the necessity of quitting the university without a degree. In the following winter his father died. The old man left but a pittance; and of that pittance almost the whole was appropriated to the support of his widow. The property to which Samuel succeeded amounted to no more than twenty pounds.

His life during the thirty years which followed was one hard struggle with poverty. The misery of that struggle needed no aggravation, but was aggravated by the sufferings of an unsound body and an unsound mind. Before the young man left the university, his hereditary malady had broken forth in a singularly cruel form. He had become an incurable hypochondriac. He said long after that he had been mad all his life, or at least not perfectly sane; and, in truth, eccentricities less strange than his have often been thought ground sufficient for absolving felons, and for setting aside wills. His grimaces, his gestures, his mutterings, sometimes diverted and sometimes terrified people who did not know him. At a dinner table he would, in a fit of absence, stoop down and twitch off a lady's shoe. He would amaze a drawing-room by suddenly ejaculating a clause of the Lord's Prayer. He would conceive an unintelligible aversion to a particular alley, and perform a great circuit rather than see the hateful place. He would set his heart on touching every post in the streets through which he walked. If by any chance he missed a post, he would go back a hundred yards and repair the omission. Under the influence of his disease, his senses became morbidly torpid, and his imagination morbidly active. At one time he would stand poring on the town clock without being able to tell the hour. At another he would distinctly hear his mother, who was many miles off, calling him by his name. But this was not the worst. A deep melancholy took possession of him, and gave a dark tinge to all his views of human nature and of human destiny. Such wretchedness as he endured has driven many men to shoot themselves or drown themselves. But he was under no temptation to commit suicide. He was sick of life; but he was afraid of death; and he shuddered at every sight or sound which reminded him of the inevitable hour. In religion he found but little comfort during his long and frequent fits of dejection; for his religion partook of his own character. The light from heaven shone on him indeed, but not in a direct line, or with its own pure splendor. The rays had to struggle through a disturbing medium; they reached him refracted, dulled, and discolored by the thick gloom which had settled on his soul, and, though they might be sufficiently clear to guide him, were too dim to cheer him.

With such infirmities of body and of mind, this celebrated man was left, at two-and-twenty, to fight his way through the world. He remained during about five years in the midland counties. At Lichfield, his birthplace and his early home, he had inherited some friends and acquired others. He was kindly noticed by Henry Hervey, a gay officer of noble family, who happened to be quartered there. Gilbert Walmesley, registrar of the ecclesiastical court of the diocese, a man of distinguished parts, learning, and knowledge of the world, did himself honor by patronizing the young adventurer, whose repulsive person, unpolished manners, and squalid garb moved many of the petty aristocracy of the neighborhood to laughter or to disgust. At Lichfield, however, Johnson could find no way of earning a livelihood. He became usher of a grammar school in Leicestershire; he resided as a humble companion in the house of a country gentleman; but a life of dependence was insupportable to his haughty spirit. He repaired to Birmingham, and there earned a few guineas by literary drudgery. In that town he printed a translation, little noticed at the time, and long forgotten, of a Latin book about Abyssinia. He then put forth proposals for publishing by subscription the poems of Politian, with notes containing a history of modern Latin verse; but subscriptions did not come in, and the volume never appeared.

While leading this vagrant and miserable life, Johnson fell in love. The object of his passion was Mrs. Elizabeth Porter, a widow who had children as old as himself. To ordinary spectators the lady appeared to be a short, fat, coarse woman, painted half an inch thick, dressed in gaudy colors, and fond of exhibiting provincial airs and graces which were not exactly those of the Queensberrys and Lepels. To Johnson, however, whose passions were strong, whose eyesight was too weak to distinguish cerise from natural bloom, and who had seldom or never been in the same room with a woman of real fashion, his Titty, as he called her, was the most beautiful, graceful, and accomplished of her sex. That his admiration was unfeigned cannot be doubted; for she was as poor as himself. She accepted, with a readiness which did her little honor, the addresses of a suitor who might have been her son. The marriage, however, in spite of occasional wranglings, proved happier than might have been expected. The lover continued to be under the illusions of the wedding-day till the lady died in her sixty-fourth year. On her monument he placed an inscription extolling the charms of her person and of her manners; and when, long after her decease, he had occasion to mention her, he exclaimed with a tenderness half ludicrous half pathetic, "Pretty creature!"

His marriage made it necessary for him to exert himself more strenuously than he had hitherto done. He took a house in the neighborhood of his native town, and advertised for pupils. But eighteen months passed away, and only three pupils came to his academy. Indeed, his appearance was so strange, and his temper so violent, that his schoolroom must have resembled an ogre's den. Nor was the tawdry painted grandmother whom he called his Titty well qualified to make provision for the comfort of young gentlemen. David Garrick, who was one of the pupils, used, many years later, to throw the best company of London into convulsions of laughter by mimicking the endearments of this extraordinary pair.

At length Johnson, in the twenty-eighth year of his age, determined to seek his fortune in the capital as a literary adventurer. He set out with a few guineas, three acts of the tragedy of *Irene* in manuscript, and two or three letters of introduction from his friend Walmesley. Never since literature became a calling in England had it been a less gainful calling than at the time when Johnson took up his residence in London. In the preceding generation a writer of eminent merit was sure to be munificently rewarded by the Government. The least that he could expect was a pension or a sinecure place; and, if he showed any aptitude for politics, he might hope to be a member of parliament, a lord of the treasury, an ambassador, a secretary of state. It would be easy, on the other hand, to name several writers of the 19th century of whom the least successful has received forty thousand pounds from the booksellers. But Johnson entered on his vocation in the most dreary part of the dreary interval which separated two ages of prosperity. Literature had ceased to flourish under the patronage of the great, and had not begun to flourish under the patronage of the public. One man of letters, indeed, Pope, had acquired by his pen what was then considered as a handsome fortune, and lived on a footing of equality with nobles and ministers of state. But this was a solitary exception. Even an author whose reputation was established, and whose works were popular—such an author as Thomson, whose *Seasons* were in every library, such an author as Fielding, whose *Pasquin*

had had a greater run than any drama since *The Beggar's Opera*—was sometimes glad to obtain, by pawning his best coat, the means of dining on tripe at a cookshop underground, where he could wipe his hands after his greasy meal on the back of a Newfoundland dog. It is easy, therefore, to imagine what humiliations and privations must have awaited the novice who had still to earn a name. One of the publishers to whom Johnson applied for employment measured with a scornful eye that athletic though uncouth frame, and exclaimed, "You had better get a porter's knot, and carry trunks." Nor was the advice bad, for a porter was likely to be as plentifully fed, and as comfortably lodged, as a poet.

Some time appears to have elapsed before Johnson was able to form any literary connection from which he could expect more than bread for the day which was passing over him. He never forgot the generosity with which Hervey, who was now residing in London, relieved his wants during this time of trial. "Harry Hervey," said the old philosopher many years later, "was a vicious man; but he was very kind to me. If you call a dog Hervey, I shall love him." At Hervey's table Johnson sometimes enjoyed feasts which were made more agreeable by contrast. But in general he dined, and thought that he dined well, on sixpennyworth of meat and a pennyworth of bread at an alehouse near Drury Lane.

The effect of the privations and sufferings which he endured at this time was discernible to the last in his temper and his deportment. His manners had never been courtly. They now became almost savage. Being frequently under the necessity of wearing shabby coats and dirty shirts, he became a confirmed sloven. Being often very hungry when he sat down to his meals, he contracted a habit of eating with ravenous greediness. Even to the end of his life, and even at the tables of the great, the sight of food affected him as it affects wild beasts and birds of prey. His taste in cookery, formed in subterranean ordinaries and *à la mode* beefshops, was far from delicate. Whenever he was so fortunate as to have near him a hare that had been kept too long, or a meat pie made with rancid butter, he gorged himself with such violence that his veins swelled and the moisture broke out on his forehead. The affronts which his poverty emboldened stupid and low-minded men to offer to him would have broken a mean spirit into sycophancy, but made him rude even to ferocity. Unhappily the insolence which, while it was defensive, was pardonable, and in some sense respectable, accompanied him into societies where he was treated with courtesy and kindness. He was repeatedly provoked into striking those who had taken liberties with him. All the sufferers, however, were wise enough to abstain from talking about their beatings, except Osborne, the most rapacious and brutal of booksellers, who proclaimed everywhere that he had been knocked down by the huge fellow whom he had hired to puff the Harleian Library.

About a year after Johnson had begun to reside in London he was fortunate enough to obtain regular employment from Cave, an enterprising and intelligent bookseller, who was proprietor and editor of the *Gentleman's Magazine*. That journal, just entering on the ninth year of its long existence, was the only periodical work in the kingdom which then had what would now be called a large circulation. It was, indeed, the chief source of parliamentary intelligence. It was not then safe, even during a recess, to publish an account of the proceedings of either House without some disguise. Cave, however, ventured to entertain his readers with what he called "Reports of the Debates of the Senate of Lilliput." France was Blefuscu: London was Mildendo; pounds were sprugs; the duke of Newcastle was the Nardac secretary of state; Lord Hardwicke was the Hurgo Hickrad; and William Pulteney was Wingul Pulnub. To write the speeches was during several years the business of Johnson He was generally furnished with notes, meagre indeed, and inaccurate, of what had been said: but sometimes he had to find arguments and eloquence both for the ministry and for the opposition. He was himself a Tory, not from rational conviction—for his serious opinion was that one form of government was just as good or as bad as another—but from mere passion, such as inflamed the Capulets against the Montagues, or the Blues of the Roman circus against the Greens. In his infancy he had heard so much talk about the villanies of the Whigs, and the dangers of the church, that he had become a furious partisan when he could scarcely speak. Before he was three he had insisted on being taken to hear Sacheverel preach at Lichfield cathedral, and had listened to the sermon with as much respect, and probably with as much intelligence, as any Staffordshire squire in the congregation. The work which had been begun in the nursery had been completed by the university. Oxford, when Johnson resided there, was the most Jacobitical place in England; and Pembroke was one of the most Jacobitical colleges in Oxford. The prejudices which he brought up to London were scarcely less absurd than those of his own Tom Tempest. Charles II. and James II. were two of the best kings that ever reigned. Laud, a poor creature who never did, said, or wrote any thing indicating more than the ordinary capacity of an old woman, was a prodigy of parts and learning over whose tomb Art and Genius still continued to weep. Hampden deserved no more honorable name than that of "the zealot of rebellion." Even the ship money, condemned not less decidedly by Falkland and Clarendon than by the bitterest Roundheads, Johnson would not pronounce to have been an unconstitutional impost. Under a Government the mildest that had ever been known in the world, under a Government which allowed to the people an unprecedented liberty of speech and action, he fancied that he was a slave; he assailed the ministry with obloquy which refuted itself, and regretted the lost freedom and happiness of those golden days in which a writer who had taken but one-tenth part of the license allowed to him would have been pilloried, mangled with the shears, whipped at the cart's tail, and flung into a noisome dungeon to die. He hated dissenters and stock-jobbers, the excise and the army, septennial parliaments, and Continental connections. He long had an aversion to the Scotch, an aversion of which he could not remember the commencement, but which, he owned, had probably originated in his abhorrence of the conduct of the nation during the Great Rebellion. It is easy to guess in what manner debates on great party questions were likely to be reported by a man whose judgment was so much disordered by party spirit. A show of fairness was indeed necessary to the prosperity of the *Magazine*. But Johnson long afterwards owned that, though he had saved appearances, he had taken care that the Whig dogs should not have the best of it; and, in fact, every passage which has lived, every passage which bears the marks of his higher faculties, is put into the mouth of some member of the opposition.

A few weeks after Johnson had entered on these obscure labors, he published a work which at once placed him high among the writers of his age. It is probable that what he had suffered during his first year in London had often reminded him of some parts of that noble poem in which Juvenal had described the misery and degradation of a needy man of letters, lodged among the pigeons' nests in the tottering garrets which overhung the streets of Rome. Pope's admirable imitations of Horace's *Satires* and *Epistles* had recently appeared, were in every hand, and were by many readers thought superior to the originals. What Pope had done for Horace, Johnson aspired to do for Juvenal. The enterprise was bold, and yet judicious. For between Johnson and Juvenal there was much in common, much more certainly than between Pope and Horace.

Johnson's *London* appeared without his name in May, 1738. He received only ten guineas for this stately and vigorous poem; but the sale was rapid, and the success complete. A second edition was required within a week. Those small critics who are always desirous to lower established reputations ran about proclaiming that the anonymous satirist was superior to Pope in Pope's own peculiar department of literature. It ought to be remembered, to the honor of Pope, that he joined heartily in the applause with which the appearance of a rival genius was welcomed. He made inquiries about the author of *London*. Such a man, he said, could not long be concealed. The name was soon discovered; and Pope, with great kindness, exerted himself to obtain an academical degree and the mastership of a grammar school for the poor young poet. The attempt failed, and Johnson remained a bookseller's hack.

It does not appear that these two men, the most eminent writer of the generation which was going out, and the most eminent writer of the generation which was coming in, ever saw each other. They lived in very different circles, one surrounded by dukes and earls, the other by starving pamphleteers and index-makers. Among Johnson's associates at this time may be mentioned Boyse, who, when his shirts were pledged, scrawled Latin verses sitting up in bed with his arms through two holes in his blanket, who composed very respectable sacred poetry when he was sober, and who was at last run over by a hackney coach when he was drunk; Hoole, surnamed the metaphysical tailor, who, instead of attending to his measures, used to trace geometrical diagrams on the board where he sat cross-legged; and the penitent impostor, George Psalmanazar, who, after poring all day, in a humble lodging, on the folios of Jewish rabbis and Christian fathers, indulged himself at night with literary and theological conversation at an alehouse in the city. But the most remarkable of the persons with whom at this time Johnson consorted was Richard Savage, an earl's son, a shoemaker's apprentice, who had seen life in all its forms, who had feasted among blue ribands in Saint James's Square, and had lain with fifty pounds weight of irons on his legs in the condemned ward of Newgate. This man had, after many vicissitudes of fortune sunk at last into abject and hopeless poverty. His pen had failed him. His patrons had been taken away by death, or estranged by the riotous profusion with which he squandered their bounty, and the ungrateful insolence with which he rejected their advice. He now lived by begging. He dined on venison and champagne whenever he had been so fortunate as to borrow a guinea. If his questing had been unsuccessful, he appeased the rage of hunger with some scraps of broken meat, and lay down to rest under the piazza of Covent Garden in warm weather, and, in cold weather, as near as he could get to the furnace of a glass house. Yet, in his misery, he was still an agreeable companion. He had an inexhaustible store of anecdotes about that gay and brilliant world from which he was now an outcast. He had observed the great men of both parties in hours of careless relaxation, had seen the leaders of opposition without the mask of patriotism, and had heard the prime minister roar with laughter and tell stories not over-decent. During some months Savage lived in the closest familiarity with Johnson; and then the friends parted, not without tears. Johnson remained in London to drudge for Cave. Savage went to the west of England, lived there as he had lived everywhere, and in 1743 died, penniless and heart-broken, in Bristol jail.

Soon after his death, while the public curiosity was strongly excited about his extraordinary character and his not less extraordinary adventures, a life of him appeared widely different from the catchpenny lives of eminent men which were then a staple article of manufacture in Grub Street. The style was indeed deficient in ease and variety; and the writer was evidently too partial to the Latin element of our language. But the little work, with all its faults, was a masterpiece. No finer specimen of literary biography existed in any language, living or dead; and a discerning critic might have confidently predicted that the author was destined to be the founder of a new school of English eloquence.

The *Life of Savage* was anonymous; but it was well known in literary circles that Johnson was the writer. During the three years which followed, he produced no important work; but he was not, and indeed could not be, idle. The fame of his abilities and learning continued to grow. Warburton pronounced him a man of parts and genius; and the praise of Warburton was then no light thing. Such was Johnson's reputation that, in 1747, several eminent booksellers combined to employ him in the arduous work of preparing a *Dictionary of the English Language*, in two folio volumes. The sum which they agreed to pay him was only fifteen hundred guineas; and out of this sum he had to pay several poor men of letters who assisted him in the humbler parts of his task.

The prospectus of the *Dictionary* he addressed to the earl of Chesterfield. Chesterfield had long been celebrated for the politeness of his manners, the brilliancy of his wit, and the delicacy of his taste. He was acknowledged to be the finest speaker in the House of Lords. He had recently governed Ireland, at a momentous conjuncture, with eminent firmness, wisdom, and humanity; and he had since become secretary of state. He received Johnson's homage with the most winning affability, and requited it with a few guineas, bestowed doubtless in a very graceful manner, but was by no means desirous to see all his carpets blackened with the London mud, and his soups and wines thrown to right and left over the gowns of fine ladies and the waistcoats of fine gentlemen, by an absent awkward scholar, who gave strange starts and uttered strange growls, who dressed like a scarecrow, and ate like a cormorant. During some time Johnson continued to call on his patron, but, after being repeatedly told by the porter that his lordship was not at home, took the hint, and ceased to present himself at the inhospitable door.

Johnson had flattered himself that he should have completed his *Dictionary* by the end of 1750; but it was not till 1755 that he at length gave his huge volumes to the world. During the seven years which he passed in the drudgery of penning definitions and marking quotations for transcription, he sought for relaxation in literary labor of a more agreeable kind. In 1749 he published the *Vanity of Human Wishes*, an excellent imitation of the tenth satire of Juvenal. It is in truth not easy to say whether the palm belongs to the ancient or to the modern poet. The couplets in which the fall of Wolsey is described, though lofty and sonorous, are feeble when compared with the wonderful lines which bring before us all Rome in a tumult on the day of the fall of Sejanus, the laurels on the doorposts, the white bull stalking towards the Capitol, the statues rolling down from their pedestals, the flatterers of the disgraced minister running to see him dragged with a hook through the streets, and to have a kick at his carcase before it is hurled into the Tiber. It must be owned too that in the concluding passage the Christian moralist has not made the most of his advantages, and has fallen decidedly short of the sublimity of his pagan model. On the other hand, Juvenal's Hannibal must yield to Johnson's Charles; and Johnson's vigorous and pathetic enumeration of the miseries of a literary life must be allowed to be superior to Juvenal's lamentation over the fate of Demosthenes and Cicero. For the copyright of the *Vanity of Human Wishes* Johnson received only fifteen guineas.

A few days after the publication of this poem, his tragedy, begun many years before, was brought on the stage. His pupil, David Garrick, had in 1741 made his appearance on a humble stage in Goodman's Fields,

had at once risen to the first place among actors, and was now, after several years of almost uninterrupted success, manager of Drury Lane Theatre. The relation between him and his old preceptor was of a very singular kind. They repelled each other strongly, and yet attracted each other strongly. Nature had made them of very different clay; and circumstances had fully brought out the natural peculiarities of both. Sudden prosperity had turned Garrick's head. Continued adversity had soured Johnson's temper. Johnson saw with more envy than became so great a man the villa, the plate, the china, the Brussels carpet, which the little mimic had got by repeating, with grimaces and gesticulations, what wiser men had written; and the exquisitely sensitive vanity of Garrick was galled by the thought that, while all the rest of the world was applauding him, he could obtain from one morose cynic, whose opinion it was impossible to despise, scarcely any compliment not acidulated with scorn. Yet the two Lichfield men had so many early recollections in common, and sympathized with each other on so many points on which they sympathized with nobody else in the vast population of the capital, that, though the master was often provoked by the monkey-like impertinence of the pupil, and the pupil by the bearish rudeness of the master, they remained friends till they were parted by death. Garrick now brought *Irene* out, with alterations sufficient to displease the author, yet not sufficient to make the piece pleasing to the audience. The public, however, listened, with little emotion, but with much civility, to five acts of monotonous declamation. After nine representations the play was withdrawn. It is, indeed, altogether unsuited to the stage, and, even when perused in the closet, will be found hardly worthy of the author. He had not the slightest notion of what blank verse should be. A change in the last syllable of every other line would make the versification of the *Vanity of Human Wishes* closely resemble the versification of *Irene*. The poet, however, cleared, by his benefit nights, and by the sale of the copyright of his tragedy, about three hundred pounds, then a great sum in his estimation.

About a year after the representation of *Irene*, he began to publish a series of short essays on morals, manners, and literature. This species of composition had been brought into fashion by the success of the *Tatler*, and by the still more brilliant success of the *Spectator*. A crowd of small writers had vainly attempted to rival Addison. The *Lay Monastery*, the *Censor*, the *Freethinker*, the *Plain Dealer*, the *Champion*, and other works of the same kind had had their short day. None of them had obtained a permanent place in our literature; and they are now to be found only in the libraries of the curious. At length Johnson undertook the adventure in which so many aspirants had failed. In the thirty-sixth year after the appearance of the last number of the *Spectator* appeared the first number of the *Rambler*. From March, 1750, to March, 1752, this paper continued to come out every Tuesday and Saturday.

From the first the *Rambler* was enthusiastically admired by a few eminent men. Richardson, when only five numbers had appeared, pronounced it equal if not superior to the *Spectator*. Young and Hartley expressed their approbation not less warmly. Bubb Dodington, among whose many faults indifference to the claims of genius and learning cannot be reckoned, solicited the acquaintance of the writer. In consequence probably of the good offices of Dodington, who was then the confidential adviser of Prince Frederick, two of his royal highness's gentlemen carried a gracious message to the printing office, and ordered seven copies for Leicester House. But these overtures seem to have been very coldly received. Johnson had had enough of the patronage of the great to last him all his life, and was not disposed to haunt any other door as he had haunted the door of Chesterfield.

By the public the *Rambler* was at first very coldly received. Though the price of a number was only twopence, the sale did not amount to five hundred. The profits were therefore very small. But as soon as the flying leaves were collected and reprinted they became popular. The author lived to see thirteen thousand copies spread over England alone. Separate editions were published for the Scotch and Irish markets. A large party pronounced the style perfect, so absolutely perfect that in some essays it would be impossible for the writer himself to alter a single word for the better. Another party, not less numerous, vehemently accused him of having corrupted the purity of the English tongue. The best critics admitted that his diction was too monotonous, too obviously artificial, and now and then turgid even to absurdity. But they did justice to the acuteness of his observations on morals and manners, to the constant precision and frequent brilliancy of his language, to the weighty and magnificent eloquence of many serious passages, and to the solemn yet pleasing humor of some of the lighter papers. On the question of precedence between Addison and Johnson, a question which, seventy years ago, was much disputed, posterity has pronounced a decision from which there is no appeal. Sir Roger, his chaplain, and his butler, Will Wimble and Will Honeycomb, the "Vision of Mirza," the "Journal of the Retired Citizen," the "Everlasting Club," the "Dunmow Flitch," the "Loves of Hilpah and Shalum," the "Visit to the Exchange," and the "Visit to the Abbey" are known to everybody. But many men and women, even of highly cultivated minds, are unacquainted with Squire Bluster and Mrs. Busy, Quisquilius and Venustulus, the "Allegory of Wit and Learning," the "Chronicle of the Revolutions of a Garret," and the sad fate of Aningait and Ajut.

The last *Rambler* was written in a sad and gloomy hour. Mrs. Johnson had been given over by the physicians. Three days later she died. She left her husband almost broken-hearted. Many people had been surprised to see a man of his genius and learning stooping to every drudgery, and denying himself almost every comfort, for the purpose of supplying a silly, affected old woman with superfluities, which she accepted with but little gratitude. But all his affection had been concentrated on her. He had neither brother nor sister, neither son nor daughter. To him she was beautiful as the Gunnings, and witty as Lady Mary. Her opinion of his writings was more important to him than the voice of the pit of Drury Lane Theatre, or the judgment of the *Monthly Review*. The chief support which had sustained him through the most arduous labor of his life was the hope that she would enjoy the fame and the profit which he anticipated from his *Dictionary*. She was gone; and in that vast labyrinth of streets, peopled by eight hundred thousand human beings, he was alone. Yet it was necessary for him to set himself, as he expressed it, doggedly to work. After three more laborious years, the *Dictionary* was at length complete.

It had been generally supposed that this great work would be dedicated to the eloquent and accomplished nobleman to whom the prospectus had been addressed. He well knew the value of such a compliment; and therefore, when the day of publication drew near, he exerted himself to soothe, by a show of zealous and at the same time of delicate and judicious kindness, the pride which he had so cruelly wounded. Since the *Ramblers* had ceased to appear, the town had been entertained by a journal called the *World*, to which many men of high rank and fashion contributed. In two successive numbers of the *World*, the *Dictionary* was, to use the modern phrase, puffed with wonderful skill. The writings of Johnson were warmly praised. It was proposed that he should be invested with the authority of a dictator, nay, of a pope, over our language, and that his decisions about the meaning and

the spelling of words should be received as final. His two folios, it was said, would of course be bought by everybody who could afford to buy them. It was soon known that these papers were written by Chesterfield. But the just resentment of Johnson was not to be so appeased. In a letter written with singular energy and dignity of thought and language, he repelled the tardy advances of his patron. The *Dictionary* came forth without a dedication. In the preface the author truly declared that he owed nothing to the great, and described the difficulties with which he had been left to struggle so forcibly and pathetically that the ablest and most malevolent of all the enemies of his fame, Horne Tooke, never could read that passage without tears.

The public, on this occasion, did Johnson full justice, and something more than justice. The best lexicographer may well be content if his productions are received by the world with cold esteem. But Johnson's *Dictionary* was hailed with an enthusiasm such as no similar work has ever excited. It was indeed the first dictionary which could be read with pleasure. The definitions show so much acuteness of thought and command of language, and the passages quoted from poets, divines, and philosophers are so skilfully selected, that a leisure hour may always be very agreeably spent in turning over the pages. The faults of the book resolve themselves, for the most part, into one great fault. Johnson was a wretched etymologist. He knew little or nothing of any Teutonic language except English, which indeed, as he wrote it, was scarcely a Teutonic language; and thus he was absolutely at the mercy of Junius and Skinner.

The *Dictionary*, though it raised Johnson's fame, added nothing to his pecuniary means. The fifteen hundred guineas which the booksellers had agreed to pay him had been advanced and spent before the last sheets issued from the press. It is painful to relate that twice in the course of the year which followed the publication of this great work he was arrested and carried to sponging-houses, and that he was twice indebted for his liberty to his excellent friend Richardson. It was still necessary for the man who had been formally saluted by the highest authority as dictator of the English language to supply his wants by constant toil. He abridged his *Dictionary*. He proposed to bring out an edition of Shakespeare by subscription, and many subscribers sent in their names and laid down their money; but he soon found the task so little to his taste that he turned to more attractive employments. He contributed many papers to a new monthly journal, which was called the *Literary Magazine*. Few of these papers have much interest; but among them was the very best thing that he ever wrote, a masterpiece both of reasoning and of satirical pleasantry, the review of Jenyns' *Inquiry into the Nature and Origin of Evil*.

In the spring of 1758 Johnson put forth the first of a series of essays, entitled the *Idler*. During two years these essays continued to appear weekly. They were eagerly read, widely circulated, and indeed impudently pirated, while they were still in the original form, and had a large sale when collected into volumes. The *Idler* may be described as a second part of the *Rambler*, somewhat livelier and somewhat weaker than the first part.

While Johnson was busied with his *Idlers*, his mother, who had accomplished her ninetieth year, died at Lichfield. It was long since he had seen her, but he had not failed to contribute largely out of his small means to her comfort. In order to defray the charges of her funeral, and to pay some debts which she had left, he wrote a little book in a single week, and sent off the sheets to the press without reading them over. A hundred pounds were paid him for the copyright, and the purchasers had great cause to be pleased with their bargain, for the book was *Rasselas*.

The success of *Rasselas* was great, though such ladies as Miss Lydia Languish must have been grievously disappointed when they found that the new volume from the circulating library was little more than a dissertation on the author's favorite theme, the "vanity of human wishes;" that the prince of Abyssinia was without a mistress, and the princess without a lover; and that the story set the hero and the heroine down exactly where it had taken them up. The style was the subject of much eager controversy. The *Monthly Review* and the *Critical Review* took different sides. Many readers pronounced the writer a pompous pedant, who would never use a word of two syllables where it was possible to use a word of six, and who could not make a waiting woman relate her adventures without balancing every noun with another noun, and every epithet with another epithet. Another party, not less zealous, cited with delight numerous passages in which weighty meaning was expressed with accuracy and illustrated with splendor. And both the censure and the praise were merited.

About the plan of *Rasselas* little was said by the critics; and yet the faults of the plan might seem to invite severe criticism. Johnson has frequently blamed Shakespeare for neglecting the proprieties of time and place, and for ascribing to one age or nation the manners and opinions of another. Yet Shakespeare has not sinned in this way more grievously than Johnson. Rasselas and Imlac, Nekayah and Pekuah, are evidently meant to be Abyssinians of the 18th century; for the Europe which Imlac describes is the Europe of the 18th century, and the inmates of the Happy Valley talk familiarly of that law of gravitation which Newton discovered, and which was not fully received even at Cambridge till the 18th century. What a real company of Abyssinians would have been may be learned from Bruce's *Travels*. But Johnson, not content with turning filthy savages, ignorant of their letters, and gorged with raw steaks cut from living cows, into philosophers as eloquent and enlightened as himself or his friend Burke, and into ladies as highly accomplished as Mrs. Lennox or Mrs. Sheridan, transferred the whole domestic system of England to Egypt. Into a land of harems, a land of polygamy, a land where women are married without ever being seen, he introduced the flirtations and jealousies of our ballrooms. In a land where there is boundless liberty of divorce, wedlock is described as the indissoluble compact. "A youth and maiden meeting by chance, or brought together by artifice, exchange glances, reciprocate civilities, go home, and dream of each other. Such," says Rasselas, "is the common process of marriage." Such it may have been, and may still be, in London, but assuredly not at Cairo. A writer who was guilty of such improprieties had little right to blame the poet who made Hector quote Aristotle, and represented Julio Romano as flourishing in the days of the oracle of Delphi.

By such exertions as have been described Johnson supported himself till the year 1762. In that year a great change in his circumstances took place. He had from a child been an enemy of the reigning dynasty. His Jacobite prejudices had been exhibited with little disguise both in his works and in his conversation. Even in his massy and elaborate *Dictionary* he had, with a strange want of taste and judgment, inserted bitter and contumelious reflections on the Whig party. The excise, which was a favorite resource of Whig financiers, he had designated as a hateful tax. He had railed against the commissioners of excise in language so coarse that they had seriously thought of prosecuting him. He had with difficulty been prevented from holding up the lord privy seal by name as an example of the meaning of the word "renegade." A pension he had defined as pay given to a state hireling to betray his country; a pensioner as a slave of state hired by a stipend to obey a master. It seemed unlikely that the author of these definitions would himself be pensioned. But that was a time of won-

ders. George III. had ascended the throne, and had, in the course of a few months, disgusted many of the old friends, and conciliated many of the old enemies of his house. The city was becoming mutinous; Oxford was becoming loyal. Cavendishes and Bentincks were murmuring; Somersets and Wyndhams were hastening to kiss hands. The head of the treasury was now Lord Bute, who was a Tory, and could have no objection to Johnson's Toryism. Bute wished to be thought a patron of men of letters; and Johnson was one of the most eminent and one of the most needy men of letters in Europe. A pension of three hundred a year was graciously offered, and with very little hesitation accepted.

This event produced a change in Johnson's whole way of life. For the first time since his boyhood he no longer felt the daily goad urging him to the daily toil. He was at liberty, after thirty years of anxiety and drudgery, to indulge his constitutional indolence, to lie in bed till two in the afternoon, and to sit up talking till four in the morning, without fearing either the printer's devil or the sheriff's officer.

One laborious task indeed he had bound himself to perform. He had received large subscriptions for his promised edition of Shakespeare; he had lived on those subscriptions during some years; and he could not without disgrace omit to perform his part in the contract. His friends repeatedly exhorted him to make an effort, and he repeatedly resolved to do so. But, notwithstanding their exhortations and his resolutions, month followed month, year followed year, and nothing was done. He prayed fervently against his idleness; he determined, as often as he received the sacrament, that he would no longer doze away and trifle away his time; but the spell under which he lay resisted prayer and sacrament. His private notes at this time are made up of self-reproaches. "My indolence," he wrote on Easter eve, in 1764, "has sunk into grosser sluggishness. A kind of strange oblivion has overspread me, so that I know not what has become of the last year." Easter, 1765, came, and found him still in the same state. "My time," he wrote, "has been unprofitably spent, and seems as a dream that has left nothing behind. My memory grows confused, and I know not how the days pass over me." Happily for his honor, the charm which held him captive was at length broken by no gentle or friendly hand. He had been weak enough to pay serious attention to a story about a ghost which haunted a house in Cock Lane, and had actually gone himself, with some of his friends, at one in the morning, to St. John's Church, Clerkenwell, in the hope of receiving a communication from the perturbed spirit. But the spirit, though adjured with all solemnity, remained obstinately silent; and it soon appeared that a naughty girl of eleven had been amusing herself by making fools of so many philosophers. Churchill, who, confident in his powers, drunk with popularity, and burning with party spirit, was looking for some man of established fame and Tory politics to insult, celebrated the Cock Lane ghost in three cantos, nicknamed Johnson Pomposo, asked where the book was which had been so long promised and so liberally paid for, and directly accused the great moralist of cheating. This terrible word proved effectual, and in October, 1765, appeared, after a delay of nine years, the new edition of Shakespeare.

This publication saved Johnson's character for honesty, but added nothing to the fame of his abilities and learning. The preface, though it contains some good passages, is not in his best manner. The most valuable notes are those in which he had an opportunity of showing how attentively he had during many years observed human life and human nature. The best specimen is the note on the character of Polonius. Nothing so good is to be found even in Wilhelm Meister's admirable examination of *Hamlet*. But here praise must end. It would be difficult to name a more slovenly, a more worthless edition of any great classic. The reader may turn over play after play without finding one happy conjectural emendation, or one ingenious and satisfactory explanation of a passage which had baffled preceding commentators. Johnson had, in his prospectus, told the world that he was peculiarly fitted for the task which he had undertaken, because he had, as a lexicographer, been under the necessity of taking a wider view of the English language than any of his predecessors. That his knowledge of our literature was extensive is indisputable. But, unfortunately, he had altogether neglected that very part of our literature with which it is especially desirable that an editor of Shakespeare should be conversant. It is dangerous to assert a negative. Yet little will be risked by the assertion that in the two folio volumes of the *English Dictionary* there is not a single passage quoted from any dramatist of the Elizabethan age, except Shakespeare and Ben Jonson. Even from Ben the quotations are few. Johnson might easily in a few months have made himself well acquainted with every old play that was extant. But it never seems to have occurred to him that this was a necessary preparation for the work which he had undertaken. He would doubtless have admitted that it would be the height of absurdity in a man who was not familiar with the works of Æschylus and Euripides to publish an edition of Sophocles. Yet he ventured to publish an edition of Shakespeare, without having ever in his life, as far as can be discovered, read a single scene of Massinger, Ford, Dekker, Webster, Marlow, Beaumont, or Fletcher. His detractors were noisy and scurrilous. Those who most loved and honored him had little to say in praise of the manner in which he had discharged the duty of a commentator. He had, however, acquitted himself of a debt which had long lain heavy on his conscience, and he sank back into the repose from which the sting of satire had roused him. He long continued to live upon the fame which he had already won. He was honored by the university of Oxford with a doctor's degree, by the Royal Academy with a professorship, and by the king with an interview, in which his Majesty most graciously expressed a hope that so excellent a writer would not cease to write. In the interval, however, between 1765 and 1775 Johnson published only two or three political tracts, the longest of which he could have produced in forty-eight hours, if he had worked as he worked on the *Life of Savage* and on *Rasselas*.

But, though his pen was now idle, his tongue was active. The influence exercised by his conversation, directly upon those with whom he lived, and indirectly on the whole literary world, was altogether without a parallel. His colloquial talents were indeed of the highest order. He had strong sense, quick discernment, wit, humor, immense knowledge of literature and of life, and an infinite store of curious anecdotes. As respected style, he spoke far better than he wrote. Every sentence which dropped from his lips was as correct in structure as the most nicely-balanced period of the *Rambler*. But in his talk there were no pompous triads, and little more than a fair proportion of words in *-osity* and *-ation*. All was simplicity, ease, and vigor. He uttered his short, weighty, and pointed sentences with a power of voice, and a justness and energy of emphasis, of which the effect was rather increased than diminished by the rollings of his huge form, and by the asthmatic gaspings and puffings in which the peals of his eloquence generally ended. Nor did the laziness which made him unwilling to sit down to his desk prevent him from giving instruction or entertainment orally. To discuss questions of taste, of learning, of casuistry, in language so exact and so forcible that it might have been printed without the alteration of a word, was to him no exertion, but a pleasure. He loved, as he said, to fold his legs and have his talk out. He was ready to bestow the overflowings of his full mind on anybody who would start a subject, on a fellow-passenger in a stage coach, or on

the person who sat at the same table with him in an eating-house. But his conversation was nowhere so brilliant and striking as when he was surrounded by a few friends, whose abilities and knowledge enabled them, as he once expressed it, to send him back every ball that he threw. Some of these, in 1764, formed themselves into a club, which gradually became a formidable power in the commonwealth of letters. The verdicts pronounced by this conclave on new books were speedily known over all London, and were sufficient to sell off a whole edition in a day, or to condemn the sheets to the service of the trunkmaker and the pastry cook. Nor shall we think this strange when we consider what great and various talents and acquirements met in the little fraternity. Goldsmith was the representative of poetry and light literature, Reynolds of the arts, Burke of political eloquence and political philosophy. There, too, were Gibbon the greatest historian and Jones the greatest linguist of the age. Garrick brought to the meetings his inexhaustible pleasantry, his incomparable mimicry, and his consummate knowledge of stage effect. Among the most constant attendants were two high-born and high-bred gentlemen, closely bound together by friendship, but of widely different characters and habits,—Bennet Langton, distinguished by his skill in Greek literature, by the orthodoxy of his opinions, and by the sanctity of his life, and Topham Beauclerk, renowned for his amours, his knowledge of the gay world, his fastidious taste, and his sarcastic wit. To predominate over such a society was not easy. Yet even over such a society Johnson predominated. Burke might indeed have disputed the supremacy to which others were under the necessity of submitting. But Burke, though not generally a very patient listener, was content to take the second part when Johnson was present; and the club itself, consisting of so many eminent men, is to this day popularly designated as Johnson's club.

Among the members of this celebrated body was one to whom it has owed the greater part of its celebrity, yet who was regarded with little respect by his brethren, and had not without difficulty obtained a seat among them. This was James Boswell, a young Scotch lawyer, heir to an honorable name and a fair estate. That he was a coxcomb and a bore, weak, vain, pushing, curious, garrulous, was obvious to all who were acquainted with him. That he could not reason, that he had no wit, no humor, no eloquence, is apparent from his writings. And yet his writings are read beyond the Mississippi, and under the Southern Cross, and are likely to be read as long as the English exists either as a living or as a dead language. Nature had made him a slave and an idolater. His mind resembled those creepers which the botanists call parasites, and which can subsist only by clinging round the stems and imbibing the juices of stronger plants. He must have fastened himself on somebody. He might have fastened himself on Wilkes, and have become the fiercest patriot in the Bill of Rights Society. He might have fastened himself on Whitfield, and have become the loudest field-preacher among the Calvinistic Methodists. In a happy hour he fastened himself on Johnson. The pair might seem ill-matched. For Johnson had early been prejudiced against Boswell's country. To a man of Johnson's strong understanding and irritable temper, the silly egotism and adulation of Boswell must have been as teasing as the constant buzz of a fly. Johnson hated to be questioned; and Boswell was eternally catechizing him on all kinds of subjects, and sometimes propounding such questions as, "What would you do, sir, if you were locked up in a tower with a baby?" Johnson was a water-drinker and Boswell was a winebibber, and indeed little better than an habitual sot. It was impossible that there should be perfect harmony between two such companions. Indeed, the great man was sometimes provoked into fits of passion, in which he said things which the small man, during a few hours, seriously resented. Every quarrel, however, was soon made up. During twenty years the disciple continued to worship the master; the master continued to scold the disciple, to sneer at him, and to love him. The two friends ordinarily resided at a great distance from each other. Boswell practised in the Parliament House of Edinburgh, and could pay only occasional visits to London. During those visits his chief business was to watch Johnson, to discover all Johnson's habits, to turn the conversation to subjects about which Johnson was likely to say something remarkable, and to fill quarto note-books with minutes of what Johnson had said. In this way were gathered the materials out of which was afterwards constructed the most interesting biographical work in the world.

Soon after the club began to exist, Johnson formed a connection less important indeed to his fame, but much more important to his happiness, than his connection with Boswell. Henry Thrale, one of the most opulent brewers in the kingdom, a man of sound and cultivated understanding, rigid principles, and liberal spirit, was married to one of those clever, kind-hearted, engaging, vain, pert young women, who are perpetually doing or saying what is not exactly right, but who, do or say what they may, are always agreeable. In 1765 the Thrales became acquainted with Johnson, and the acquaintance ripened fast into friendship. They were astonished and delighted by the brilliancy of his conversation. They were flattered by finding that a man so widely celebrated preferred their house to any other in London. Even the peculiarities which seemed to unfit him for civilized society, his gesticulations, his rollings, his puffings, his mutterings, the strange way in which he put on his clothes, the ravenous eagerness with which he devoured his dinner, his fits of melancholy, his fits of anger, his frequent rudeness, his occasional ferocity, increased the interest which his new associates took in him. For these things were the cruel marks left behind by a life which had been one long conflict with disease and with adversity. In a vulgar hack writer such oddities would have excited only disgust. But in a man of genius, learning, and virtue their effect was to add pity to admiration and esteem. Johnson soon had an apartment at the brewery in Southwark, and a still more pleasant apartment at the villa of his friends on Streatham Common. A large part of every year he passed in those abodes, abodes which must have seemed magnificent and luxurious indeed, when compared with the dens in which he had generally been lodged. But his chief pleasures were derived from what the astronomer of his Abyssinian tale called "the endearing elegance of female friendship." Mrs. Thrale rallied him, soothed him, coaxed him, and if she sometimes provoked him by her flippancy, made ample amends by listening to his reproofs with angelic sweetness of temper. When he was diseased in body and in mind, she was the most tender of nurses. No comfort that wealth could purchase, no contrivance that womanly ingenuity, set to work by womanly compassion, could devise, was wanting to his sick-room. He requited her kindness by an affection pure as the affection of a father, yet delicately tinged with a gallantry which, though awkward, must have been more flattering than the attentions of a crowd of the fools who gloried in the names, now obsolete, of Buck and Maccaroni. It would seem that a full half of Johnson's life during about sixteen years was passed under the roof of the Thrales. He accompanied the family sometimes to Bath, and sometimes to Brighton, once to Wales and once to Paris. But he had at the same time a house in one of the narrow and gloomy courts on the north of Fleet Street. In the garrets was his library, a large and miscellaneous collection of books, falling to pieces and begrimed with dust. On a lower floor he sometimes, but very rarely, regaled a friend with a plain dinner—a veal pie, or a leg of lamb and spinach, and a rice pudding. Nor was the dwelling uninhabited during his long absences.

It was the home of the most extraordinary assemblage of inmates that ever was brought together. At the head of the establishment Johnson had placed an old lady named Williams, whose chief recommendations were her blindness and her poverty. But, in spite of her murmurs and reproaches, he gave an asylum to another lady who was as poor as herself, Mrs. Desmoulins, whose family he had known many years before in Staffordshire. Room was found for the daughter of Mrs. Desmoulins, and for another destitute damsel, who was generally addressed as Miss Carmichael, but whom her generous host called Polly. An old quack doctor named Levett, who bled and dosed coalheavers and hackney coachmen, and received for fees crusts of bread, bits of bacon, glasses of gin, and sometimes a little copper, completed this strange menagerie. All these poor creatures were at constant war with each other, and with Johnson's negro servant Frank. Sometimes, indeed, they transferred their hostilities from the servant to the master, complained that a better table was not kept for them, and railed or maundered till their benefactor was glad to make his escape to Streatham, or to the Mitre Tavern. And yet he, who was generally the haughtiest and most irritable of mankind, who was but too prompt to resent anything which looked like a slight on the part of a purse-proud bookseller, or of a noble and powerful patron, bore patiently from mendicants, who, but for his bounty, must have gone to the workhouse, insults more provoking than those for which he had knocked down Osborne and bidden defiance to Chesterfield. Year after year Mrs. Williams and Mrs. Desmoulins, Polly and Levett, continued to torment him and to live upon him.

The course of life which has been described was interrupted in Johnson's sixty-fourth year by an important event. He had early read an account of the Hebrides, and had been much interested by learning that there was so near him a land peopled by a race which was still as rude and simple as in the Middle Ages. A wish to become intimately acquainted with a state of society so utterly unlike all that he had ever seen frequently crossed his mind. But it is not probable that his curiosity would have overcome his habitual sluggishness, and his love of the smoke, the mud, and the cries of London, had not Boswell importuned him to attempt the adventure, and offered to be his squire. At length, in August, 1773, Johnson crossed the Highland line, and plunged courageously into what was then considered by most Englishmen as a dreary and perilous wilderness. After wandering about two months through the Celtic region, sometimes in rude boats which did not protect him from the rain, and sometimes on small shaggy ponies which could hardly bear his weight, he returned to his old haunts with a mind full of new images and new theories. During the following year he employed himself in recording his adventures. About the beginning of 1775 his *Journey to the Hebrides* was published, and was, during some weeks, the chief subject of conversation in all circles in which any attention was paid to literature. The book is still read with pleasure. The narrative is entertaining; the speculations, whether sound or unsound, are always ingenious; and the style, though too stiff and pompous, is somewhat easier and more graceful than that of his early writings. His prejudice against the Scotch had at length become little more than matter of jest; and whatever remained of the old feeling had been effectually removed by the kind and respectful hospitality with which he had been received in every part of Scotland. It was, of course, not to be expected that an Oxonian Tory should praise the Presbyterian polity and ritual, or that an eye accustomed to the hedgerows and parks of England should not be struck by the bareness of Berwickshire and East Lothian. But even in censure Johnson's tone is not unfriendly. The most enlightened Scotchmen, with Lord Mansfield at their head, were well pleased. But some foolish and ignorant Scotchmen were moved to anger by a little unpalatable truth which was mingled with much eulogy, and assailed him whom they chose to consider as the enemy of their country with libels much more dishonorable to their country than anything that he had ever said or written. They published paragraphs in the newspapers, articles in the magazines, sixpenny pamphlets, five-shilling books. One scribbler abused Johnson for being blear-eyed, another for being a pensioner; a third informed the world that one of the doctor's uncles had been convicted of felony in Scotland, and had found that there was in that country one tree capable of supporting the weight of an Englishman. Macpherson, whose *Fingal* had been proved in the *Journey* to be an impudent forgery, threatened to take vengeance with a cane. The only effect of this threat was that Johnson reiterated the charge of forgery in the most contemptuous terms, and walked about, during some time, with a cudgel, which, if the impostor had not been too wise to encounter it, would assuredly have descended upon him, to borrow the sublime language of his own epic poem, "like a hammer on the red son of the furnace."

Of other assailants Johnson took no notice whatever. He had early resolved never to be drawn into controversy; and he adhered to his resolution with a steadfastness which is the more extraordinary because he was, both intellectually and morally, of the stuff of which controversialists are made. In conversation he was a singularly eager, acute, and pertinacious disputant. When at a loss for good reasons, he had recourse to sophistry; and when heated by altercation, he made unsparing use of sarcasm and invective. But when he took his pen in his hand, his whole character seemed to be changed. A hundred bad writers misrepresented him and reviled him; but not one of the hundred could boast of having been thought by him worthy of a refutation, or even of a retort. The Kenricks, Campbells, MacNicols, and Hendersons did their best to annoy him, in the hope that he would give them importance by answering them. But the reader will in vain search his works for any allusion to Kenrick or Campbell, to MacNicol or Henderson. One Scotchman, bent on vindicating the fame of Scotch learning, defied him to the combat in a detestable Latin hexameter—

"Maxime, si tu vis, cupio contendere tecum."

But Johnson took no notice of the challenge. He had learned, both from his own observation and from literary history, in which he was deeply read, that the place of books in the public estimation is fixed, not by what is written about them, but by what is written in them, and that an author whose works are likely to live is very unwise if he stoops to wrangle with detractors whose works are certain to die. He always maintained that fame was a shuttlecock which could be kept up only by being beaten back as well as beaten forward, and which would soon fall if there were only one battledore. No saying was oftener in his mouth than that fine apophthegm of Bentley, that no man was ever written down but by himself.

Unhappily, a few months after the appearance of the *Journey to the Hebrides*, Johnson did what none of his envious assailants could have done, and to a certain extent succeeded in writing himself down. The disputes between England and her American colonies had reached a point at which no amicable adjustment was possible. Civil war was evidently impending; and the ministers seem to have thought that the eloquence of Johnson might with advantage be employed to inflame the nation against the opposition here, and against the rebels beyond the Atlantic. He had already written two or three tracts in defence of the foreign and domestic policy of the Government; and those tracts, though hardly worthy of him, were much superior to the crowd of pamphlets which lay on the

counters of Almon and Stockdale. But his *Taxation No Tyranny* was a pitiable failure. The very title was a silly phrase, which can have been recommended to his choice by nothing but a jingling alliteration which he ought to have despised. The arguments were such as boys use in debating societies. The pleasantry was as awkward as the gambols of a hippopotamus. Even Boswell was forced to own that in this unfortunate piece he could detect no trace of his master's powers. The general opinion was that the strong faculties which had produced the *Dictionary* and the *Rambler* were beginning to feel the effect of time and of disease, and that the old man would best consult his credit by writing no more.

But this was a great mistake. Johnson had failed, not because his mind was less vigorous than when he wrote *Rasselas* in the evenings of a week, but because he had foolishly chosen, or suffered others to choose for him, a subject such as he would at no time have been competent to treat. He was in no sense a statesman. He never willingly read or thought or talked about affairs of state. He loved biography, literary history, the history of manners; but political history was positively distasteful to him. The question at issue between the colonies and the mother country was a question about which he had really nothing to say. He failed, therefore, as the greatest men must fail when they attempt to do that for which they are unfit—as Burke would have failed if Burke had tried to write comedies like those of Sheridan, as Reynolds would have failed if Reynolds had tried to paint landscapes like those of Wilson. Happily, Johnson soon had an opportunity of proving most signally that his failure was not to be ascribed to intellectual decay.

On Easter eve 1777 some persons, deputed by a meeting which consisted of forty of the first booksellers in London, called upon him. Though he had some scruples about doing business at that season, he received his visitors with much civility. They came to inform him that a new edition of the English poets, from Cowley downwards, was in contemplation, and to ask him to furnish short biographical prefaces. He readily undertook the task, a task for which he was pre-eminently qualified. His knowledge of the literary history of England since the Restoration was unrivalled. That knowledge he had derived partly from books, and partly from sources which had long been closed; from old Grub Street traditions; from the talk of forgotten poetasters and pamphleteers, who had long been lying in parish vaults; from the recollections of such men as Gilbert Walmesley, who had conversed with the wits of Button, Cibber, who had mutilated the plays of two generations of dramatists, Orrery, who had been admitted to the society of Swift, and Savage, who had rendered services of no very honorable kind to Pope. The biographer therefore sat down to his task with a mind full of matter. He had at first intended to give only a paragraph to every minor poet, and only four or five pages to the greatest name. But the flood of anecdote and criticism overflowed the narrow channel. The work, which was originally meant to consist only of a few sheets, swelled into ten volumes, small volumes, it is true, and not closely printed. The first four appeared in 1779, the remaining six in 1781.

The *Lives of the Poets* are, on the whole, the best of Johnson's works. The narratives are as entertaining as any novel. The remarks on life and on human nature are eminently shrewd and profound. The criticisms are often excellent, and, even when grossly and provokingly unjust, well deserve to be studied. For, however erroneous they may be, they are never silly. They are the judgments of a mind trammelled by prejudice and deficient in sensibility, but vigorous and acute. They therefore generally contain a portion of valuable truth which deserves to be separated from the alloy; and, at the very worst, they mean something, a praise to which much of what is called criticism in our time has no pretensions.

Savage's Life Johnson reprinted nearly as it had appeared in 1744. Whoever, after reading that life, will turn to the other lives will be struck by the difference of style. Since Johnson had been at ease in his circumstances he had written little and had talked much. When therefore he, after the lapse of years, resumed his pen, the mannerism which he had contracted while he was in the constant habit of elaborate composition was less perceptible than formerly, and his diction frequently had a colloquial ease which it had formerly wanted. The improvement may be discerned by a skilful critic in the *Journey to the Hebrides*, and in the *Lives of the Poets* is so obvious that it cannot escape the notice of the most careless reader.

Among the *Lives* the best are perhaps those of Cowley, Dryden, and Pope. The very worst is, beyond all doubt, that of Gray.

This great work at once became popular. There was, indeed, much just and much unjust censure; but even those who were loudest in blame were attracted by the book in spite of themselves. Malone computed the gains of the publishers at five or six thousand pounds. But the writer was very poorly remunerated. Intending at first to write very short prefaces, he had stipulated for only two hundred guineas. The booksellers, when they saw how far his performance had surpassed his promise, added only another hundred. Indeed Johnson, though he did not despise or affect to despise money, and though his strong sense and long experience ought to have qualified him to protect his own interests, seems to have been singularly unskilful and unlucky in his literary bargains. He was generally reputed the first English writer of his time. Yet several writers of his time sold their copyrights for sums such as he never ventured to ask. To give a single instance, Robertson received four thousand five hundred pounds for the *History of Charles V.;* and it is no disrespect to the memory of Robertson to say that the *History of Charles V.* is both a less valuable and a less amusing book than the *Lives of the Poets.*

Johnson was now in his seventy-second year. The infirmities of age were coming fast upon him. That inevitable event of which he never thought without horror was brought near to him; and his whole life was darkened by the shadow of death. He had often to pay the cruel price of longevity. Every year he lost what could never be replaced. The strange dependants to whom he had given shelter, and to whom, in spite of their faults, he was strongly attached by habit, dropped off one by one; and, in the silence of his home, he regretted even the noise of their scolding matches. The kind and generous Thrale was no more; and it would have been well if his wife had been laid beside him. But she survived to be the laughing-stock of those who had envied her, and to draw from the eyes of the old man who had loved her beyond anything in the world tears far more bitter than he would have shed over her grave. With some estimable and many agreeable qualities, she was not made to be independent. The control of a mind more steadfast than her own was necessary to her respectability. While she was restrained by her husband, a man of sense and firmness, indulgent to her taste in trifles, but always the undisputed master of his house, her worst offences had been impertinent jokes, white lies, and short fits of pettishness ending in sunny good humor. But he was gone; and she was left an opulent widow of forty, with strong sensibility, volatile fancy, and slender judgment. She soon fell in love with a music-master from Brescia, in whom nobody but herself could discover anything to admire. Her pride, and perhaps some better feelings, struggled hard against this degrading passion. But the struggle irritated her nerves, soured her temper, and at length endangered her health. Conscious that her choice was one which Johnson could not approve, she became desirous to escape from

his inspection. Her manner towards him changed. She was sometimes cold and sometimes petulant. She did not conceal her joy when he left Streatham; she never pressed him to return; and, if he came unbidden, she received him in a manner which convinced him that he was no longer a welcome guest. He took the very intelligible hints which she gave. He read for the last time a chapter of the Greek Testament in the library which had been formed by himself. In a solemn and tender prayer he commended the house and its inmates to the Divine protection, and, with emotions which choked his voice and convulsed his powerful frame, left forever that beloved home for the gloomy and desolate house behind Fleet Street, where the few and evil days which still remained to him were to run out. Here, in June, 1783, he had a paralytic stroke, from which, however, he recovered, and which does not appear to have at all impaired his intellectual faculties. But other maladies came thick upon him. His asthma tormented him day and night. Dropsical symptoms made their appearance. While sinking under a complication of diseases, he heard that the woman whose friendship had been the chief happiness of sixteen years of his life had married an Italian fiddler, that all London was crying shame upon her, and that the newspapers and magazines were filled with allusions to the Ephesian matron and the two pictures in Hamlet. He vehemently said that he would try to forget her existence. He never uttered her name. Every memorial of her which met his eye he flung into the fire. She meanwhile fled from the laughter and hisses of her countrymen and countrywomen to a land where she was unknown, hastened across Mount Cenis, and learned, while passing a merry Christmas of concerts and lemonade parties at Milan, that the great man with whose name hers is inseparably associated had ceased to exist.

He had, in spite of much mental and much bodily affliction, clung vehemently to life. The feeling described in that fine but gloomy paper which closes the series of his *Idlers* seemed to grow stronger in him as his last hour drew near. He fancied that he should be able to draw his breath more easily in a southern climate, and would probably have set out for Rome or Naples but for his fear of the expense of the journey. That expense, indeed, he had the means of defraying; for he had laid up about two thousand pounds, the fruit of labors which had made the fortune of several publishers. But he was unwilling to break in upon this hoard, and he seems to have wished even to keep its existence a secret. Some of his friends hoped that the Government might be induced to increase his pension to six hundred pounds a year, but this hope was disappointed, and he resolved to stand one English winter more. That winter was his last. His legs grew weaker; his breath grew shorter; the fatal water gathered fast, in spite of incisions which he, courageous against pain but timid against death, urged his surgeons to make deeper and deeper. Though the tender care which had mitigated his sufferings during months of sickness at Streatham was withdrawn, he was not left desolate. The ablest physicians and surgeons attended him, and refused to accept fees from him. Burke parted from him with deep emotion. Windham sat much in the sick-room, arranged the pillows, and sent his own servant to watch at night by the bed. Frances Burney, whom the old man had cherished with fatherly kindness, stood weeping at the door; while Langton, whose piety eminently qualified him to be an adviser and comforter at such a time, received the last pressure of his friend's hand within. When at length the moment, dreaded through so many years, came close, the dark cloud passed away from Johnson's mind. His temper became unusually patient and gentle; he ceased to think with terror of death, and of that which lies beyond death; and he spoke much of the mercy of God, and of the propitiation of Christ. In this serene frame of mind he died on the 13th of December, 1784. He was laid, a week later, in Westminster Abbey, among the eminent men of whom he had been the historian,—Cowley and Denham, Dryden and Congreve, Gay, Prior, and Addison.

Since his death the popularity of his works—the *Lives of the Poets*, and perhaps the *Vanity of Human Wishes*, excepted—has greatly diminished. His *Dictionary* has been altered by editors till it can scarcely be called his. An allusion to his *Rambler* or his *Idler* is not readily apprehended in literary circles. Tho fame even of *Rasselas* has grown somewhat dim. But, though the celebrity of the writings may have declined, the celebrity of the writer, strange to say, is as great as ever. Boswell's book has done for him more than the best of his own books could do. The memory of other authors is kept alive by their works. But the memory of Johnson keeps many of his works alive. The old philosopher is still among us in the brown coat with the metal buttons and the shirt which ought to be at wash, blinking, puffing, rolling his head, drumming with his fingers, tearing his meat like a tiger, and swallowing his tea in oceans. No human being who has been more than seventy years in the grave is so well known to us. And it is but just to say that our intimate acquaintance with what he would himself have called the anfractuosities of his intellect and of his temper serves only to strengthen our conviction that he was both a great and a good man. (M.)

JOHNSTON, Albert Sidney (1803–1862), American soldier, was born in Kentucky in 1803. After graduating at West Point in 1826 he served for eight years in the United States army, emigrated to Texas in 1834, and entered the Texan service as private in 1836. His promotion was so rapid that in 1838 he was appointed commander-in-chief, and till 1840 acted as secretary of war. From 1840 till 1846 he lived in retirement on his farm in Texas; but in the latter year he accepted the colonelcy of a regiment of Texan volunteers to serve against Mexico. As a staff-officer he was present at the battle of Monterey in September 1846. Texas joined the Union in 1846; and in 1849 Johnson received a major's commission in the United States army. After various services he won the rank of brevet brigadier-general by his skilful conduct of the expedition sent to Utah in 1857 to bring the Mormons to order. In January 1861 he was transferred from the command of the Texas department to that of the Pacific department; but in April he was superseded, probably on account of his secessionist sympathies. He resigned his national commission in May 1861, and accepted a command in the Confederate army. While acting as commander-in-chief at the battle of Shiloh, he was killed, April 6, 1862.

JOHNSTON, Alexander Keith[1] (1804–1871), geographer, was born at Kirkhill, near Edinburgh, in December 1804. After an education at the High School of Edinburgh he was apprenticed to an engraver; and about 1830 he joined his brother in a prosperous printing and engraving business. His passion for geography had early developed itself, but his first important work was the *National Atlas* of general geography, which gained for him in 1843 the appointment of geographer-royal for Scotland. Johnston was the first to bring the study of physical geography into competent notice in England. His attention had been called to the subject by Humboldt; and after years of labor he published his magnificent *Physical Atlas* in 1848, followed by a second and enlarged edition in 1856. This, by means of maps with descriptive letterpress, illustrates the geology, hydrography, meteorology, botany, zoology, and ethnology of the globe, and undoubtedly marks an epoch in the history of English geographical science. The rest of Johnston's life was equally given to geography, his later years to its educational aspects especially. His services were recognized by election to fellowships of the leading scientific societies of Europe, India, and America. For

[1] [His son, of the same name (1844-79), explored in Southern Africa (where he died) for the Royal Geographical Society.—Am. Ed.]

his chart of the geographical distribution of health and disease he received the diploma of the London Epidemiological Society; in 1865 he received the degree of LL.D. from Edinburgh University; and in 1871 the Royal Geographical Society awarded him its Victoria medal. He died July 9, 1871. His son of the same name (1844–1879) was also the author of various geographical works and papers.

Johnston published a *Dictionary of Geography* in 1850, with many later editions; *The Royal Atlas of Modern Geography*, begun in 1855; an atlas of military geography to accompany Alison's *History of Europe;* and a variety of other atlases and maps for educational or scientific purposes.

JOHNSTONE, a manufacturing town in the county of Renfrew, Scotland, is situated on the Black Cart river, about 10 miles west of Glasgow, with which it is connected by rail. First feued in 1781, it rose rapidly in prosperity owing to the introduction of the cotton-manufacture. The town contains several engineering works, a paper mill, and the largest flax mill in Scotland. About a mile to the east is Elderslie, the traditional birthplace of Wallace. The population in 1871 was 7538, and in 1901, 10,502.

JOHNSTOWN, a burgh of Cambria county, Pennsylvania, U.S., is situated on the Stony Creek and the Conemaugh river, 78 miles east of Pittsburg and 277 miles west of Philadelphia. It is the centre of nine contiguous boroughs constituting one town of 22,000 inhabitants, who are mainly employed by the Cambria Iron Company in the manufacture of iron, steel, railway bars, wire, etc. There are large woollen and flouring mills, numerous churches, and a public library. The library building was presented to the Library Association by the Cambria Iron Company. The population in 1870 was 6028, and in 1900, 35,936.[2]

JOHORE, a native state at the southern end of the Malay or Malacca peninsula, bounded by the Moar river on the N.W. and by the Indu on the N.E., with an area estimated at 20,000 square miles.[1] The territory, covered for the most part by virgin forest, has been but partially explored; but it is gradually being opened up under the patronage of the rajah Abubaker (born 5th December 1833), who has visited Europe, as well as Java and other Eastern countries, and takes a keen interest in the development of his country. At present the principal exports from Johore are gambier and catechu, black pepper, timber, rattans, and dammar; but the soil and climate are well fitted for the growth of sugar-cane, rice, tobacco, coffee, and similar products, and the rajah is promoting the formation of regular plantations. The town of Johore is a flourishing little settlement 15 miles northeast of Singapore, in 1° 0′ 26″ N. lat., and 103° 47′ E. long. A school where English is taught has been founded in the town by the rajah, who also maintains a similar institution in Singapore. The population of the country, exclusive of the tribes of the interior, is estimated at 100,000, the greater number being Malays and Chinese. It was the present rajah's grandfather—Abdulrahman Tumongong of Rio, Singapore, and Johore—who ceded Singapore to the British. The dynasty is the continuation of the sultans of Malacca, who retired to Johore on the conquest of their capital in 1311 by Albuquerque. Bokhari, author of *Makôta Raja Raja*, one of the most remarkable productions in the Malay tongue, was a native of Johore.

JOIGNY, chief town of an arrondissement in the department of Yonne, France, is situated on the right bank of the Yonne, about 12 miles northwest of Auxerre. Its streets are steep and narrow; some of the houses are of wood, and date from the 15th or 16th century. Joigny has tribunals of first instance and commerce, a communal college, a library with 9000 volumes, and a civil and military hospital, and manufactures cloth, hunting and other arms, percussion-caps, leather, cooper work, and brandy. It has also trade in cereals, cattle, and wood, and in an excellent variety of wine, produced in the neighborhood. The chief buildings are the old and interesting churches of St. Andrew, St. John, and St. Thibaut; the ruins of the old castle of the 10th century; the partly destroyed later castle; the large 10th century tower beside the prison; the hôtel de ville, of 1727; the palais de justice, including the fine chapel of the Ferrands; the college; and the stone bridge of seven arches. Of the former massive fortifications, St. John's gate and the moat are the chief remains. The population in 1901 was 5,039.

Joigny, in Latin Joviniacum, is held to have been founded by Flavius Jovinius, *magister equitum* under the emperor Valentinian (364 A.D.). It gave its name to an important line of mediæval counts (whence sprang the counts of Joinville), who about 1716 merged in the dukes of Villeroy.

JOINERY. See BUILDING, vol. iv. p. 433.

JOINT, in law, as applied to obligations, estates, etc., implies that the rights in question relate to the aggregate of the parties joined. Obligations to which several are parties may be *several*, *i.e.*, enforceable against each independently of the others, or *joint*, *i.e.*, enforceable only against all of them taken together, or *joint and several*, *i. e.*, enforceable against each or all at the option of the claimant. So an interest or estate given to two or more persons for their joint lives continues only so long as all the lives are in existence. Joint-tenants are co-owners who take together at the same time, by the same title, and without any difference in the quality or extent of their respective interests; and when one of the joint-tenants dies his share, instead of going to his own heirs, lapses to his co-tenants by survivorship. This estate is therefore to be carefully distinguished from *tenancy in common*, when the co-tenants have each a separate interest which on death passes to the heirs and not to the surviving tenants. When several take an estate together any words or facts implying severance will prevent the tenancy from being construed as joint.

JOINTS, in the sense in which engineers use the word, may be classed either (*a*) according to their material, as in stone or brick, wood, or metal; or (*b*) according to their object, to prevent leakage of air, steam, or water, or to transmit force, which may be thrust, pull, or shear; or (*c*) according as they are stationary or moving ("working" in technical language). Many joints, like those of ship-plates and boiler-plates, have simultaneously to fulfil both objects mentioned under (*b*).

All *stone* joints of any consequence are stationary. It being uneconomical to dress the surfaces of the stones resting on each other smoothly and so as to be accurately flat, a layer of mortar or other cementing material is laid between them. This hardens and serves to transmit the pressure from stone to stone without its being concentrated at the "high places." If the ingredients of the cement are chosen so that when hard the cement has about the same coefficient of compressibility as that of the stone or brick, the pressure will be nearly uniformly distributed. The cement also adheres to the surfaces of the stone or brick, and allows a certain amount of tension to be borne by the joint. It likewise prevents the stones slipping one on the other, *i.e.*, it gives the joint very considerable shearing strength. The composition of the cement is chosen according as it has to "set" in air or water. The joints are made impervious to air or water by "pointing" their outer edges with a superior quality of cement.

Wood joints are also nearly all stationary. Lignum vitæ is still used by engineers for the one half of some special working joints, but even in these few instances its use is rapidly dying out. Wood joints are made partially fluid-tight by "grooving and tenoning," and by "caulking" with oakum or similar material. If the wood is saturated with water, it swells, the edges of the joints press closer together, and the joints be-

[1] [For the more accurate estimate of 10,000 square miles of area, see Vol. XV. p. 325. Population is conjectural.—AM. ED.]

[2] [The greater part of the town was swept away May 31, 1889, by the bursting of a dam. Reported loss of life, 2,142. Contributions for relief estimated at $4,116,801.—AM. ED.]

come tighter the greater the water-pressure is which tends to produce leakage.

Relatively to its weaker general strength, wood is a better material than iron so far as regards the transmission of a thrust past a joint. So soon as a heavy pressure comes on the joint, all the small irregularities of the surfaces in contact are crushed up, and there results an approximately uniform distribution of the pressure over the whole area (*i.e.*, if there be no bending forces), so that no part of the material is unduly stressed. To attain this result, the abutting surfaces should be well fitted together, and the bolts binding the pieces together should be arranged so as to ensure that they will not interfere with the timber surfaces coming into this close contact.

Owing to its weak shearing strength on sections parallel to the fibre, timber is peculiarly unfitted for tension joints. If the pieces exerting the pull are simply bolted together with wooden or iron bolts, the joint cannot be trusted to transmit any considerable force with safety. The stresses become intensely localized in the immediate neighborhood of the bolts. A tolerably strong timber tension-joint can, however, be made by making the two pieces abut, and connecting them by means of iron plates covering the joint and bolted to the sides of the timbers by bolts passing through the wood. These plates should have their surfaces which lie against the wood ribbed in a direction transverse to the pull. The bolts should fit their holes slackly, and should be well tightened up so as to make the ribs sink into the surface of the timber. There will then be very little localized shearing stress brought upon the interior portions of the wood.

Metal Joints.—Iron and the other commonly used metals possess in variously high degrees the qualities desirable in substances out of which joints are to be made. The joint ends of metal pieces can easily be fashioned to any advantageous form and size without waste of material. Also these metals offer peculiar facilities for the cutting of their surfaces at a comparatively small cost so smoothly and evenly as to ensure the close contact over their whole areas of surfaces placed against each other. This is of the highest importance, especially in joints designed to transmit force.

Wrought iron and mild steel are above all other metals suitable for tension joints where there is not continuous rapid motion. Where such motion occurs, a layer, or, as it is technically termed, a "bush," of brass is inserted underneath the iron. The joint then possesses the high strength of a wrought iron one and at the same time the good frictional qualities of a brass surface.

Where the running speed is high and the intensity of pressure can be made small by adopting large bearing surfaces, cast iron is now increasingly preferred for pressure joints. But when, owing to want of space or for other reasons, the bearing surface cannot be made large in proportion to the thrust to be transmitted, gun-metal, *i. e.*, the toughest quality of brass, should be used if the speed be high, and steel if the speed be small.

Leakage past moving metal joints can be prevented by cutting the surfaces very accurately to fit each other. Steam-engine slide-valves and their seats, and piston "packing-rings" and the cylinders they work to and fro in, may be cited as examples. A subsidiary compressible "packing" is in other situations employed, an instance of which may be seen in the "stuffing-boxes" which prevent the escape of steam from steam-engine cylinders through the piston-rod hole in the cylinder cover.

Fixed metal joints are made fluid tight—(*a*) by caulking a riveted joint, *i. e.*, by hammering in the edge of the metal with a square-edged chisel (the tighter the joint requires to be against leakage the closer must be the spacing of the rivets—compare the rivet-spacing in bridge, ship, and boiler-plate joints); (*b*) by the insertion between the surfaces of a layer of one or other of various kinds of cement, the layer being thick or thin according to circumstances; (*c*) by the insertion of a layer of soft solid substance called "packing" or "insertion." A special kind of india-rubber and canvas sheet is prepared for this purpose. A very effective species of "insertion" is thin copper gauze. Sometimes a single round of thick copper wire laid in opposite grooves cut on joint surfaces serves the purpose.

The Principles of the Strength of Joints.—The conditions of strength of cemented and glued joints are too obvious to require description. It may, however, be mentioned that in most cases the joint is stronger the thinner the layer of cementing material interposed between the surfaces.

Nearly all other joints are formed by cutting one or more holes in the ends of the pieces to be joined, and inserting in these holes a corresponding number of pins. The word "pin" is technically restricted to mean a cylindrical pin in a movable joint. The word "bolt" is used when the cylindrical pin is screwed up tight with a nut so as to be immovable. When the pin is not screwed, but is fastened by being beaten down on either end, it is called a "rivet." The pin is sometimes rectangular in section, and tapered or parallel lengthwise. "Gibs" and "cottars" are examples of the latter. It is very rarely the case that fixed joints have their pins subject to simple compression in the direction of their length. They are, however, frequently subject to simple tension in that direction. A good example is the joint between a steam cylinder and its cover. Here the bolts have to resist the whole thrust of the steam, and at the same time to keep the joint steam-tight.

If D be the cylinder diameter, t the thickness of the flange of the cover, and n the number of bolts used, it can be shown that the amount the flange rises between the bolts by bending is proportional to $p\frac{D^4}{n^4t^3}$, where p is the steam pressure per unit area. If the same degree of tightness be desired for all sizes of cylinders, this deflection should be the same for all. The spacing of the bolts is proportional to $\frac{D}{n}$, and, therefore, we should have the spacing $\propto t^{\frac{3}{4}}p^{-\frac{1}{4}}$. If then the total bolt area is made proportional to the total steam pressure, it would follow that the diameter of bolt $\propto p^{\frac{3}{8}}t^{\frac{3}{8}}D^{\frac{1}{2}}$. Again, if t were reckoned in accordance with the shearing force of the steam on the circular section of the cover at the circumference of the cylinder, *i. e.*, $t \propto pD$, we would have

$$\text{spacing} \propto p^{\frac{1}{2}}D^{\frac{3}{4}},$$
$$\text{and bolt diam.} \propto p^{\frac{3}{8}}D^{\frac{7}{8}}.$$

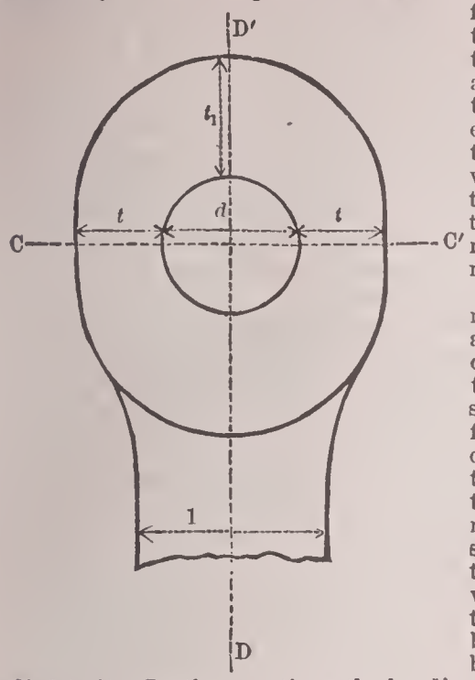
For reasons connected with technical difficulties in the foundry, t is made larger in proportion to D than this rule indicates for the smaller sizes of cylinders; and, therefore, the spacing and the bolt diameter are not made to increase quite so rapidly as the $\frac{3}{4}$ and $\frac{7}{8}$ powers of D.

No moving joints have their pins exposed to simple stress on sections transverse to the pins' axes. The pins of such joints have these transverse sections subjected to shearing and bending stresses, and the sections parallel to the pin axes to compressive stress.

The simplest case by which the subject can be illustrated is that in which a cylindrical pin passes through the ends of two links—one forked, and the other simple and lying between the branches of the fork of the other.

Let the accompanying diagram represent the end of the unforked link. The width of the link parallel to CC′ is taken as unity, and the letters on the figure indicate the ratios of the respective dimensions to this width. Let b represent the ratio of the thickness, perpendicular to the paper, of the "eye" to the thickness in the same direction of the main body of the link at D. Let also f be the intensity of uniform tensive stress on the section at D. Evidently no pressure comes on the under side of the pin below CC′. The whole pull at D is passed round half on each side of the pin, and is delivered to the upper side of the pin, on which it produces compression. Since the side sections o

through which the pull passes lie out of the direct line of that pull, the stress is much higher on the parts of these sections towards the centre line DD′ than on those further off. The lines of force crowd as close as possible together near the surface of the pin, *i. e.*, towards the main line DD′ of the pull. In other words, the inequality of stress is occasioned by the bending movements due to the centre of force not passing through the centres of gravity of area of the sections. The inequality begins at the root of the widening out of the link to form the eye, and reaches its maximum at CC′.



The bending moment at CC′ and the stress caused by it at the edge of the section can be found by the help of the ordinary theory of elasticity. The best method of doing so is to calculate the amount by which the portion of the eye below CC′ is bent by the forces applied to it. In the equations the bending moment at CC′ is inserted as an unknown quantity. The section on DD′ remaining unmoved, each element of the linear deflection is resolved parallel to CC′, and the integral from DD′ up to CC′ of all these components parallel to CC′ is equated to zero, the resultant deflection at C in the direction of CC′ being evidently nil. This equation gives the value of the bending moment at CC′, and from it the corresponding stress is obtained.

If the section at D be rectangular, as also that at CC′, then the average tensive stress on t is

$$f' = f\frac{1}{2tb};$$

and the extra stress caused at the edge of the section by the bending moment is

$$f'' = f\frac{1}{4t^2b}\left\{3(t+d) - \frac{1}{\frac{3}{2}t+d}\right\}.$$

The total maximum stress is, therefore,

$$f'+f'' = f\frac{1}{4t^2b}\left\{5t+3d-\frac{1}{\frac{3}{2}t+d}\right\}.$$

This gives the ratio of the maximum tension at the side of the eye to the uniform tension (f) on the main body of the link at D. If the section at D be circular while t remains rectangular, the corresponding ratio is a little more than $\frac{1}{4}\pi$, or about $\frac{4}{5}$ of the above. If it is desired that this maximum should not exceed f, we obtain a relation between the ratios d, t, and b by putting $f'+f''=f$. The following table exhibits the results of this calculation for rectangular section at D:—

t —	½	⅝	¾	⅞	1
d = ½ and b =	3·1	2·5	2	1·7	1·5
d = ¾ " b =	4	3	2·4	2	1·7
d = 1 " b =	4·9	3·5	2·8	2·3	1·9

For circular section at D, b is about $\frac{4}{5}$ of these values.

Although the values of t and d that are commonly used all fall considerably within the limits of the above tables, the values of b usually found in practice are much less than those shown above. This means that the eyes of links as commonly proportioned are much more severely stressed than is the main body of the link.

In working joints the frictional resistance to rotation throws more than half the main pull on one side of the eye, and this side is therefore still more severely stressed than is indicated by the above equations.

The stresses on the portion of the eye lying above CC′ are complicated by the combination with the direct pull already mentioned of the pressure of the upper surface of the pin. This latter is normal at each point if the surface be smooth and the joint a motionless one. It increases from zero at CC′ to a maximum at the line DD′. At this point the intensity of the surface pressure is, according to an approximate theoretic estimate, about $\frac{4}{\pi}$, or 1¼ times greater than if the whole pull were evenly distributed over the projection on CC′ of the upper half surface of the pin. It has often been fallaciously imagined that the central section t_1 is exposed to severe shearing stress. From the symmetry of the case, however, it is evident that on this section the shear is zero. The maximum shear occurs on a section nearly parallel to DD′, and somewhat less than $\frac{1}{2}d$ distant from DD′. The exact position of this section of maximum shear depends upon the dimension-ratio t_1, which is usually made considerably greater than t.

The pin surface pressure has transverse components parallel to CC′, which produce tension and a bending moment on the section t_1. A theoretical approximation to this bursting pressure is $\frac{1}{\pi}$, or about ⅓, of the whole pull exerted by the link, and the line of the resultant (parallel to CC′) is situated $\frac{1}{8}d$ distant from the centre of the pin. A small portion of this is borne by the central section on DD′ of the main part of the link below CC′, but by far the larger part is borne by the section marked t_1. If it were wholly borne by that section, the average tension on t_1 would, for a circular section at D, be $\frac{f}{4t_1b}$, and the extra stress produced by this bending moment would be $\frac{f}{4t_1b}\left(3+\frac{d}{t_1}\right)$. Other bending moments, however, are thrown on this section due to—first, the resultant of the pin-surface-pressure-components parallel to DD′, which lies at $\frac{2}{3\pi}d$, or about ⅛d, from the line DD′; and, second, the stress at the section CC′. Adding all these together, there is obtained an approximation to the actual tension parallel to CC′ on the lower edge of the section t_1, namely,

$$\frac{f}{t_1b}\left\{1+\tfrac{3}{8}\frac{d}{t_1}-\tfrac{7}{12}\frac{t}{t_1}-\frac{1}{5t_1(\frac{3}{2}t+d)}\right\}.$$

The shearing and bending stresses upon the pin itself depend upon whether one of the links is forked or both are simple; and also greatly upon the exactitude with which the pin fits the holes.

When the link exerts a thrust instead of a pull through the joint, a similar investigation of the state of stress may be made.

A couple of plates joined together by a single row of rivets may, so far as concerns the sections lying between the rivets, be looked upon as a number of flat links laid side by side with their eyes of equal width with the body of the link.

We may therefore apply the first of the above equations for $f'+f''$ to find the stress close to the rivets on the section coinciding with the line of the rivets. To adapt the formula to this case, it is only necessary to put $b=1$ and $t=\frac{1}{2}(1-d)$. The formula thus derived, however, gives results probably considerably higher than those actually occurring, because of the strips into which the plate has been supposed to be divided, acting on each other in such a way as to produce bending moments partly neutralizing the above increase of stress.

The strip of metal between the rivets and the edge of the plate is in the condition of a continuous beam supported by the rivets. The maximum moment occurs just over the rivets, and is nearly the same as if the load were uniformly distributed over the length of the beam. If t_1 be the ratio to the rivet-spacing of the distance of the edge of the plate to the rivet hole, the supposition of uniformity of distribution of load gives the equation $f'=f\frac{1}{2t_1^2}$ for the maximum stress on a section perpendicular to the plate edge. To make $f'=f$, it is necessary to make $t_1=\sqrt{0.5}=0.7$. The edge of the plate will then be amply strong enough to resist the greatest shear to which it is anywhere exposed.

When there are two or more rows of rivets the investigation of the stress is quite similar to the above.

In joints where the movement is rapid and continuous, the size of the pin is determined by considerations of durability against wear. The metal wears rapidly if the bearing surfaces are not well lubricated. The lubricant is pressed out from between these surfaces if the intensity of pressure exceeds a limit determined by the character of the lubricant. The size of the pin must be sufficient to prevent this limiting pressure

being reached. Even before the oil is wholly squeezed out the friction becomes so great as to heat the metal surfaces to a high temperature, which hastens the evaporation of the remaining oil. In order to ensure that the temperature may be kept low by the continuous dissipation of the heat generated, some engineers design the bearing surface in proportion to the product of the pressure and the speed, so as to allow a certain area of "conducting surface" for each unit of heat generated per second. (R. H. S.*)

JOINT STOCK COMPANIES. See COMPANY, vol. vi. p. 197.

JOINVILLE, JEAN DE (1224–1319), was the second great writer of history in Old French, and in a manner occupies the interval between Villehardouin and Froissart. From the point of view of literary history there are numerous minor chroniclers who fill up the gaps, but no one of them has the idiosyncrasy which distinguishes these three writers, and for general purposes it may be said that they complete the series of historians illustrating, as no series in any other country or language illustrates, the three periods of the Middle Ages —adolescence, complete manhood, and decadence. Joinville was born in 1224 of a good family of the province of Champagne, allied to many distinguished houses in the east of France and connected by marriage with the emperor Frederick II. The property of the Joinvilles came, curiously enough, like that of Comines, the fourth great historian of Old France, into the hands of the Orleans family, and the castle, which overhung the Marne, was sold in 1791 for purposes of demolition. The provincial court of the counts of Champagne had long been a distinguished one, and the action of Thibaut the poet, together with the neighborhood of the district to Paris, made the province less rebellious than most of the great feudal divisions of France to the royal authority. Joinville's first appearance at the king's court was in 1241, when he performed the functions of carver for his feudal superior on the occasion of the knighting of Louis IX.'s younger brother Alphonse. Seven years afterwards, when he was four and twenty, he took the cross, thereby giving St. Louis a valuable follower, and supplying himself with the occasion of an eternal memory. His family had been persistent crusaders for several generations. The crusade, however, in which he distinguished himself equally by wisdom and prowess, taught his practical spirit several lessons. He returned with the king in 1254. But, though his reverence for the personal character of his prince seems to have known no bounds, he had probably gauged accurately enough the strategic faculties of the saintly king, and he certainly had imbibed the spirit of the dictum that a man's first duties are those to his own house. He was in the intervals of his residence on his own fief a constant attendant on the court, but he declined to accompany the king on his last and fatal expedition. Some years later, in 1282, he was one of the witnesses whose testimony was formally given at St. Denis in the matter of the canonization of Louis, and long afterwards, in 1298, being then a man of more than seventy years, he was present at the exhumation of the saint's body. It was not till even later that he began his literary work, the occasion being a request from Jeanne of Navarre, the wife of Philippe le Bel and the mother of Louis le Hutin. The great interval between his experiences and the period of the composition of his history is important for the due comprehension of the latter. Books were not hastily written in those days, and some years passed before the task was completed, on its own showing, in October, 1309. Jeanne was by this time dead, and Joinville presented his book to her son Louis the Quarreller. This the original manuscript is now lost, whereby hangs a tale. Great as was his age, Joinville had not ceased to be actively loyal, and in 1315, being then almost ninety, he complied with the royal summons to bear arms against the Flemings. He was at Joinville again in 1317, and on the 11th July, 1319, he died at the age of ninety-five, leaving his possessions and his position as seneschal of Champagne to his second son Anselm. He was buried in the neighboring church of St. Laurent, where during the Revolution his bones underwent the usual profanation. In the next generation but one his male heirs failed, and the fief passed by marriage through the house of Lorraine to the Guises, and so to the house of Orleans. Besides his *Histoire de Saint Louis* and his *Credo* or "Confession of Faith," written much earlier, a considerable number, relatively speaking, of letters and business documents concerning the fief of Joinville and so forth are extant. These have an importance which we shall consider further on; but Joinville owes his place in general estimation only to his history of his crusading experiences and of the subsequent fate of his hero.

Of the famous French history books of the Middle Ages Joinville's is beyond all doubt that which bears most vivid impress of the personal characteristics of its composer. It does not, like Villehardouin, give us the picture of the temper and habits of a whole order or cast of men during an heroic period of human history; it falls far short of Froissart in vivid portraying of the picturesque and external aspects of social life; but it is altogether a more personal book than either. As has been already noticed, the age and circumstances of the writer must not be forgotten in reading it. He is a very old man telling of circumstances which occurred in his youth. He evidently thinks that the times have not changed for the better—what with the frequency with which the devil is invoked in modern France, and the sinful expenditure common in the matter of embroidered silk coats. But his laudation of times past concentrates itself almost wholly on the person of the sainted king whom, while with feudal independence he had declined to swear fealty to him, "because I was not his man," he evidently regarded with an unlimited reverence. His age, too, while it is garrulous to a degree, seems to have been entirely free from the slightest taint of boasting. No one perhaps ever took less trouble to make himself out a hero than Joinville. He is constantly admitting that on such and such an occasion he was terribly afraid; he confesses without the least shame that, when one of his followers suggested defiance of the Saracens and voluntary death, he (Joinville) paid not the least attention to him; nor does he attempt to gloss in any way his refusal to accompany St. Louis on his unlucky second crusade, or his invincible conviction that it was better to be in mortal sin than to have the leprosy, or his decided preference for wine as little watered as might be, or any other weakness. Yet he was a sincerely religious man, as the curious *Credo* written at Acre and forming a kind of anticipated appendix to the history seems sufficiently to show. He presents himself as an altogether human person, brave enough in the field, and at least when young capable of extravagant devotion to an ideal, provided the ideal was fashionable, but having at bottom a sufficient respect for his own skin and a full consciousness of the side on which his bread is buttered. Nor can he be said to be in all respects an intelligent traveller. There were in him what may be called glimmerings of deliberate literature, but they were hardly more than glimmerings. His famous description of Greek fire has a most provoking mixture of circumstantial detail with absence of verifying particulars. It is as matter of fact and comparative as Dante, without a touch of Dante's genius. "The fashion of Greek fire was such that it came to us as great as a tun of verjuice, and the fiery tail of it was as big as a mighty lance; it made such noise in the coming that it seemed like the thunder from heaven, and looked like a dragon flying through the air; so great a light did it throw that throughout the host men saw as though it were day for the light it threw." Certainly the excellent seneschal has not stinted himself of comparisons here, yet they can

hardly be said to be luminous. That the thing made a great flame, a great noise, and struck terror into the beholder, is about the sum of it all. Every now and then indeed a striking circumstance, strikingly told, occurs in Joinville, such as the famous incident of the woman who carried in one hand a chafing dish of fire, in the other a phial of water, that she might burn heaven and quench hell, lest in future any man should serve God merely for hope of the one or fear of the other. But in these cases the author only repeats what he has heard from others. On his own account he is much more interested in small personal details than in greater things. How the Saracens, when they took him prisoner, he being half dead with a complication of diseases, kindly left him "un mien couverture d'écarlate" which his mother had given him, and which he put over him, having made a hole therein and bound it round him with a cord; how when he came to Acre in a dilapidated condition an old servant of his house presented himself, and "brought me clean white hoods and combed my hair most comfortably;" how he bought a hundred tuns of wine and served it—the best first, according to high authority—well-watered to his private soldiers, somewhat less watered to the squires, and to the knights neat, but with a suggestive phial of the weaker liquid to mix "si comme ils vouloient,"—these are the details in which he seems to take greatest pleasure, and for readers six hundred years after date perhaps they are not the least interesting details.

It would, however, be a mistake to imagine that Joinville's book is exclusively or even mainly a chronicle of small beer. If he is not a Villehardouin or a Carlyle, his battlepieces are vivid and truthful, and he has occasional passages of no small episodic importance, such as that dealing with the Old Man of the Mountain. But, above all, the central figure of his book redeems it from the possibility of the charge of being commonplace or ignoble. To St. Louis Joinville is a nobler Boswell; and hero-worshipper, hero, and heroic ideal, all have something of the sublime about them. The very pettiness of the details in which the good seneschal indulges as to his own weaknesses only serves to enhance the sublime unworldliness of the king. Joinville is a better warrior than Louis, but, while the former frankly prays for his own safety, the latter only thinks of his army's when they have escaped from the hands of the aliens. One of the king's knights boasts that ten thousand pieces have been "forcontés" (counted short) to the Saracens; and it is with the utmost trouble that Joinville and the rest can persuade the king that this is a joke, and that the Saracens are much more likely to have got the advantage. He warns Joinville against wine-bibbing, against bad language, against all manner of foibles small and great; and the pupil acknowledges that this physician at any rate had healed himself in these respects. It is true that he is severe towards infidels; and his approval of the knight who, finding a Jew likely to get the better of a theological argument, resorted to the baculine variety of logic, does not meet the views of the 19th century. But Louis was not of the 19th century but of the 13th, and after his kind he certainly deserved Joinville's admiration. Side by side with his indignation at the idea of cheating his Saracen enemies may be mentioned his answer to those who after Taillebourg complained that he had let off Henry III. too easily. "He is my man now, and he was not before," said the king, a most unpractical person certainly, and in some ways a sore saint for France. But it is easy to understand the half-despairing adoration with which a shrewd and somewhat prosaic person like Joinville must have regarded this flower of chivalry born out of due time. He has had his reward, for assuredly the portrait of St. Louis from the early collection of anecdotes to the last hearsay sketch of the woful end at Tunis, with the famous *Enseignement* which is still the best summary of the theoretical duties of a Christian king in mediæval times, is such as to take away all charge of vulgarity or mere *commérage* from Joinville, a charge to which otherwise he might perhaps have been exposed.

The arrangement of the book is, considering its circumstances and the date of its composition, sufficiently methodical. According to its own account it is divided into three parts,—the first dealing generally with the character and conduct of the hero; the second with his acts and deeds in Egypt, Palestine, etc., as Joinville knew them; the third with his subsequent life and death. Of these the last is very brief, the first not long; the middle constitutes the bulk of the work. The contents of the first part are, as might be expected, miscellaneous enough, and consist chiefly of stories chosen to show the valor of Louis, his piety, his justice, his personal temperance, and so forth. The second part enters upon the history of the crusade itself, and tells how Joinville—he would hardly have done this later—pledged all his land save so much as would bring in a thousand livres a year, and started with a brave retinue of nine knights (two of whom besides himself wore bannerets), and shared a ship with the Sire d'Aspremont, leaving Joinville without raising his eyes, "pour ce que le cuer ne me attendrisist du biau chastel que je lessoie et de mes deux enfans;" how they could not get out of sight of a high mountainous island (Lampedusa or Pantellaria) till they had made a procession round the masts in honor of the Virgin; how they reached first Cyprus and then Egypt; how they took Damietta, and then entangled themselves in the Delta. Bad generalship, which is sufficiently obvious, unwholesome food,—it was Lent, and they ate the Nile fish, which had been feasting on the carcases of the slain,—and Greek fire did the rest, and personal valor was of little avail, not merely against superior numbers and better generals, but against dysentery and a certain "mal de l'ost" which attacked the mouth and legs, a curious human version of a well-known bestial malady. After ransom Acre was the chief scene of Louis's stay in the East, and here Joinville lived in some state, and saw not a few interesting things, hearing besides much gossip as to the interior affairs of Asia from ambassadors, merchants, and others. At last they journeyed back again to France, not without considerable experiences of the perils of the deep, which Joinville tells with a good deal of spirit. The remainder of the book is very brief. Some anecdotes of the king's "justice," his favorite and distinguishing attribute, during the sixteen years which intervened between the two crusades are given; then comes the story of Joinville's own refusal to join the second expedition, a refusal which bluntly alleged the harm done by the king's men who stayed at home to the vassals of those who went abroad as the reason of Joinville's resolution to remain behind. The death of the king at Tunis, his *Enseignement* to his son, and the story of his canonization, complete the work.

The book in which this interesting story is told has had a literary history which less affects its matter than the vicissitudes to which Froissart has been subjected, but which is hardly less curious in its way. There is no reason for supposing that Joinville indulged in various editions such as those which have given MM. Kervyn de Lettenhove and Siméon Luce so much trouble, and which make so vast a difference between the first and the last redaction of the chronicler of the Hundred Years' War. Indeed the great age of the seneschal of Champagne, and his intimate first-hand acquaintance with his subject, made such variations extremely improbable. But, whereas there is no great difficulty (though much labor) in ascertaining the original and all subsequent texts of Froissart, the original text of Joinville was until a few years ago unknown, and even now may be said to be in the state of a conjectural restoration. It has been said that the book was presented to Louis le Hutin. Now we have a catalogue of Louis le Hutin's library, and, strange to say, Joinville does not figure in it. His book seems to have undergone very much the same fate as that which befell the originals of the first two volumes of the *Paston Letters* which Sir John Fenn presented to George the Third. Several royal library catalogues of

the 14th century are known, but in none of these does the *Histoire de St. Louis* appear. It does appear in that of Charles V. (1411), but apparently no copy even of this survives. As everybody knows, however, books could be and were multiplied by the process of copying tolerably freely, and a copy at first or second hand which belonged to the fiddler king René in the 15th century was used for the first printed edition in 1547. Other editions were printed from other versions, all evidently posterior to the original. But in 1741 the well-known mediævalist La Curne de St. Palaye found at Lucca a manuscript of the 16th century, evidently representing an older text than any yet printed. Three years later a 14th century copy was found at Brussels, and this is the standard manuscript authority for the text of Joinville. Those who prefer to rest on MS. authority will probably hold to this text, which appears in the well-known collection of MM. Michaud and Poujoulat as well as that of Buchon, and in a careful and useful separate edition by M. Francisque Michel. The modern science of critical editing, however, which applies to mediæval texts the principles long recognized in editing the classics, has discovered in the 16th century manuscript, and still more in the original miscellaneous works of Joinville, the letters, deeds, etc., already alluded to, the materials for what we have already called a conjectural restoration, which is not without its interest, though perhaps it is possible for that interest to be exaggerated. M. Natalis de Wailly is the Joinvillian Orelli or Lachmann, and his later editions (for he has produced several) exhibit the results of the new learning. These results are not trifling, for all students of Old French know that a remarkable change—from the purely linguistic point of view more remarkable perhaps than any of subsequent occurrence—passed over the language between the beginning and the end of the century in which Joinville died. But they affect the matter of the book little, and as such cannot be compared with the changes evident in the Anglican and Gallican editions, so to speak, of Froissart. Their interest, however, is much too great and too typical not to deserve that some notice should be given to them here.

For merely general readers Buchon's or Michaud's editions of Joinville will amply suffice. Both possess translations into modern French, which, however, are hardly necessary, for the language is very easy. M. de Wailly's editions of 1868 and 1874 are critical editions, the value of which is considerable, but contestable. They are accompanied by ample annotations and appendices, with illustrations of great merit and value. Much valuable information appeared for the first time in the edition M. F. Michel, 1859. To these may be added M. A. F. Didot's *Études sur Joinville* and some articles in the *Bibliothèque de l'École des Chartes* and in *Romania*. A good sketch of the whole subject will be found in Aubertin's *Histoire de la Langue et de la Littérature Françaises au Moyen Âge*, ii. 196–211.

(G. SA.)

JOLIET, the county seat of Will county, Illinois, United States, is situated on both sides of the Des Planes river, 40 miles southwest of Chicago, with which it is connected by three railroads and the Illinois and Michigan canal. The State penitentiary near the city, erected at a cost of over $1,000,000, is one of the largest in the United States. Manufactures of various kinds, especially of iron and steel, barbed fence wire, agricultural implements and machinery, paper, boots and shoes, cut stone, draining tiles, and sewer pipes, are extensively carried on. The coal-fields of Wilmington, Morris, and Streator are within a few miles of the city. Quarries of good building stone, and deposits of fireclay, sand, and cement gravel abound in the neighborhood. Joliet is an important railroad centre, from which large quantities of manufactured articles, grain, cattle, and hogs are despatched daily. Population in 1900, 29,353.

JOMINI, HENRY, BARON (1779–1869), general in the French and afterwards in the Russian service, and writer on military tactics, was born 6th March, 1779, at Payerne, in the canton of Vaud, Switzerland, where his father held the dignity of magistrate. At an early period he showed a marked preference for a military life, but at first he was disappointed of his hopes by the dissolution of the Swiss regiments of France at the Revolution. For some years he acted as clerk in a banking-house in Paris, until the outbreak of the Swiss revolution, when he returned to his native country, and at the early age of nineteen was appointed chief secretary of war. At the peace of Lunéville in 1801 he returned to Paris and introduced himself to Marshal Ney, who made him his aide-de-camp and private secretary. In 1804 he published *Traité des grandes opérations militaires*, which in 1805 he presented to Napoleon on the field of Austerlitz, as the work of a young Swiss officer. A few days afterwards he was named colonel, and appointed first aide-de-camp to Marshal Ney. In 1806 he published a treatise on the probabilities of the war with Prussia, the ability of which so impressed Napoleon that he resolved to attach him to his person. He was present with Napoleon at the battle of Jena, but afterwards joined Ney, and afforded him important assistance in delivering his army from a very perilous situation. After the peace of Tilsit he was made chief of the staff to Ney and created a baron. In the Spanish campaign of 1808 his skilful advice contributed in no small degree to the victories of Ney, but on account of that general's jealousy he resigned his commission, and he was entering into negotiations with the emperor of Russia, when Napoleon, learning his intention, compelled him to remain in the French service with the rank of brigadier-general. On his refusal to take part in the Russian campaign, Napoleon named him governor of Wilna; but during the retreat from Moscow he at once placed his strategic skill and knowledge of the country at the service of France, and, having after the battle of Lützen obtained his old office under Marshal Ney, he suggested the happy manœuvre which led to the victory of Bautzen. Finding, however, that the road to promotion was closed against him, he again offered his services to Russia. They were accepted, and he obtained the rank of lieutenant-general, and was named aide-de-camp to the emperor. He gave the important assistance of his council to the allied armies during the German campaign, but declined to take part in the passage of the Rhine and the invasion of France in 1814. In 1817 he returned to Paris, where he published *Principes de la stratégie*, 3 vols, 1818; *Histoire critique et militaire des campagnes de la Révolution de* 1792 *à* 1801, 15 vols., 1819–24; *Vie politique et militaire de Napoléon*, 1827. In 1826 he again entered the service of Russia, and in the Turkish campaign of 1828 his sagacious advice led to the capitulation of Varna. Afterwards he was employed in organizing the military academy at St. Petersburg and in superintending the military studies of the czarowitz, for the use of whom he wrote *Tableau analytique des principales combinasons de la guerre*, the new and improved edition of which was named *Précis de l'art de la guerre*. During the latter period of his life Jomini resided at Brussels, but he afterwards returned to Paris, where he died, March 24, 1869. Although Jomini played a secondary and unobtrusive part in the great military events of his time, the military triumphs of France were in no inconsiderable degree due to his masterly counsels; and doubtless, had circumstances conspired to grant him the opportunity of playing a practical and independent rôle, he would have achieved for himself a place among the greatest generals of his country. His delineations of the campaigns of Napoleon are the ablest military account of these great wars, and his exposition of the laws of tactics and strategy have achieved for him European fame.

See Ferdinand Lecomte, *Le Général Jomini, sa vie et ses écrits*, 1861; and *Le Général Jomini*, by Sainte-Beuve, 1869.

JOMMELLI, NICCOLÒ (1714–1774), a famous Italian composer of the last century, was born at Aversa, near Naples, September 11, 1714, and received his musical education at two of the famous music schools of that capital, being at first a pupil of Durante at the Conservatorio di San Onofrio, and subsequently studying composition under Leo at La Pietà dei Turchini. His first opera, *L'Errore Amoroso*, was produced when Jommelli was only twenty-three, at

Naples, and so timid was the young composer that he prefixed a pseudonym to his work. The result, however, was favorable beyond all expectation, and encouraged Jommelli to continue his career as a dramatic composer. Three years afterwards he went to Rome to produce two new operas, and thence to Bologna, where he became acquainted with, and profited by the advice of, Padre Martini, the greatest contrapuntist of his age. In the meantime Jommelli's fame began to spread beyond the limits of his country, and in 1745 he went for the first time to Vienna, where one of his finest operas, *Dido*, was produced. Three years later he returned to Italy, and in 1754 he obtained the post of chapel-master to the music-loving duke of Würtemberg, at Stuttgart, which city he made his home for a number of years. Here he considerably modified his style in accordance with German taste, so much so that, when after an absence of fifteen years he returned to Naples, his countrymen hissed two of his operas off the stage. He retired in consequence to his native village, and only occasionally emerged from his solitude to take part in the musical life of the capital.

His last composition was a *Miserere* written a few weeks before his death, which took place at Naples, August 28, 1774. In the last-named work, as well as in his other church compositions, Jommelli proves himself to be a musician of earnest purpose and sound scholarship. In his operatic music he follows essentially the style of his age, being intent on writing effective pieces for the voice rather than upon expressing the feelings and passions of the characters; but even here he betrays a certain elevation of sentiment not always to be found amongst the composers of the latter half of the 18th century. His best dramatic work is generally supposed to be *Armida*, one of the operas scorned by the Neapolitans in 1771.

JONAH. The book of Jonah is so named from the principal personage of the narrative, only mentioned elsewhere in 2 Kings xiv. 25. Jonah there appears as a native of Zebulun, and a contemporary of Jeroboam II. (8th century B.C.). If the Book of Jonah were written then, it has a claim to rank as the oldest of the prophetic writings (Joel being in all probability of post-exile origin). The problems connected with this little book are, however, so great that no judicious critic would think of admitting such a date as proved. The problems are twofold,—(1) was the book written at one jet? and (2) is it to be understood as a history, or as an allegorical tale, and, if the latter, is it, or is it not, based at all upon tradition, or upon a nature-myth? Köhler thinks that he can trace "the hand of a late reviser, who has made alterations, interpolations, and transpositions of verses and sentences . . . . . There is at the very beginning of the story a perceptible lacuna in the second verse, where we are not told what Jonah was to announce to the men of Nineveh." He offers very plausible grounds for preferring the reading of the Septuagint in iii. 4, "yet *three* days, and Nineveh shall be overthrown," and points out that the alteration into "forty days" involves an interference with part of the details of the narrative. He detects traces of interpolation in i. 8, ii. 2–10 (A. V. 1–9), iii. 9, iv. 1–4, and other passages, and regards the passage iv. 5–8 as "full of insertions and variants." After purging the text from later additions and enlargements, we obtain a brief but simple and striking story, which, according to Köhler, formed part of a book of prophetic narrations, and therefore commenced with "And." Later Jews, by very plausible conjectures, in search of a lesson-book on penitence, for reading in times of public calamity, modified and interpolated it (comp. Mishna, *Taaniyyoth*, ii.). This is not the place to discuss this conjecture in detail; it is favored by analogy, and cannot be rejected without consideration. It enables us to account for comparatively primitive conceptions of the Godhead, and the naïveté in the description of the heathen mariners, and supplies a *locus standi* to the orthodox view of the book which would otherwise be destroyed by acute rationalistic criticism. The additions may be later, but the kernel of the narrative may be old.

At the same time, it will be seen at once that to grant that the kernel of the narrative may be pre-exile is not to grant that it is historical. From a purely literary point of view it has been urged that "the marks of a story are as patent in the book of Jonah as in any of the tales of the Thousand and One Nights." The greatest of the improbabilities is a moral one; can we conceive of a large heathen city being converted by an obscure foreign prophet? "To judge of the degree of this improbability, it is enough to read any inscription you please of an Assyrian king. Fancy Sargon or Sennacherib in the presence of Jonah. The case quoted by the *Speaker's Commentary* of a Christian priest frightening a Mahometan town into repentance is not to the point, for Christians and Moslems have a common basis in theism. How could the Ninevites give credence to a man who was not a servant of Asshur?" It is obvious that in New Testament times (see Matt. xii. 39–40, Luke xi. 29–30, and Matt. xvi. 4) the symbolic meaning of the book was the most important part of it. Why should it not have been originally composed with a symbolic or allegorical object? For the hearers of Christ, one symbolic meaning was the most important, but probably enough (for Scripture is many-sided), other ages saw different meanings. The truths of the equality of Jews and heathen before God, the prophetic and missionary character of the people of Israel, and the conditional character of prophecy, have all been suggested as possible meanings, and all possess great plausibility.

Mr. Tylor (*Early History of Mankind*, pp. 336, 337, and *Primitive Culture*, i. 306) has already pointed out the close superficial resemblance between the story of Jonah and various solar myths; and indeed the former was long ago connected with the myths of Hercules and Hesione, and Perseus and Andromeda. To suppose a direct imitation of these Greek myths is, indeed, quite gratuitous. Preller's handbook will show that the most circumstantial parallels to the Hebrew only occur in the narratives of later writers. These late narratives, however, are not improbably derived in part from earlier sources, and at any rate M. Lenormant and M. Clermont Ganneau have pointed out Babylonian and Egyptian affinities for the Greek myths in question. "In Mesopotamia the story is naturally more original and more transparent. In Mr. George Smith's translation, Tiamtu the dragon opens its mouth to swallow Bel Merodach, but in vain (Smith's *Chaldæan Genesis*, by Sayce, p. 111)." A remarkable passage in Jeremiah (li. 44), evidently alluding to a popular mythic story, seems to supply a missing link between the narrative of Jonah and the original myth. "Like the latter, it describes the destroyer as the dragon, like the former, it converts both destroyer and destroyed into symbols," no uncommon phenomenon in poetical passages of the Old Testament.[1]

The evidences of date are difficult to seize. The use of the uncommon phrase, Yahveh Elohim (iv. 6), points to a date synchronizing with that of Gen. ii., iii., but when those chapters were written is a debatable question. Many have argued the exile or post-exile origin of the book from the supposed Aramaizing character of the style; against this view, Pusey's introduction deserves reading. The arguments from internal evidence have been made best use of by Kuenen, who couples it with the book of Ruth as a product of the opposition to the strict and exclusive policy of Ezra towards heathen nations. Kalisch's theory is that the book is a romance founded perhaps on fact. "Why should not the substance of the story, though the historical annals make no allusion to such enterprise, be

[1] It is worth noticing that the "fish" of Jonah is found five or six times in paintings in the Roman catacombs assigned to the first two centuries, and that it is distinctly a dragon.

founded on a real fact? Jonah, being on intimate relations with his sovereign, might have been employed by him for important offices; foreign embassies were not unusual, and some such legation from the king of Israel to the king of Assyria is actually mentioned by Jonah's contemporary Hosea (v. 13)" (*Bible Studies*, ii. 122).

Literatur*, Leipsic, 1868, pp. 72–80; Cheyne, "Jonah, a Study in Jewish Folklore and Religion," in *Theological Review*, 1877, pp. 211–19; Kalisch, *Bible Studies*, part ii., 1878 (reviewed by Oort, *Theologisch Tijdschrift*, 1878); Köhler, "The Original Form of the Book of Jonah," in *Theological Review*, 1879, pp. 139–44. (T. K. C.)

JONAH, Rabbi, of Cordova, the most eminent Jewish grammarian and lexicographer of the Middle Ages, known also among Hebrew authors as R. Merinos (Marinus), but now usually called by his Arabic name Abu 'l Walíd Merwán ibn Janáh, was born at Cordova towards the close of the 10th century, but spent his youth partly at the neighboring Jewish town of Lucena (Alisana), where he studied under Isaac ben Gikatila and Isaac ben Saul. He appears not to have returned to Cordova till after the death of the famous Hayyúj, the founder of a scientific Hebrew grammar based on the doctrine of triliteral roots. Though not a personal disciple of Hayyúj, Abu 'l Walíd adopted the general principles of his system, and early applied himself to the task of completing and correcting the observations of his predecessor on the subject of weak roots. While engaged in these studies he retired from Cordova during the siege of the town by the Berber prince Suleiman (1013), and took up his residence in Saragossa, where he published his first work, the *Kitáb el Mustalḥik*, so named because it contained an *attempt to supply* the omissions of Hayyúj. The Jews of Saragossa were not favorably disposed to the new philology, and the writings of Abu 'l Walíd were not only displeasing to men of the old school, but involved him in bitter controversy with the professed disciples of Hayyúj, on whose views he had presumed to improve. The most formidable of these antagonists was Samuel Ibn Nagdela Hallevy, the prime minister of Granada. Abu 'l Walíd had much to suffer from the rancor of so influential an opponent, but he persisted in his studies, which were finally crowned by the publication of the *Kitáb el Tanḳíḥ*, or "Book of Minute Research," a grammatical and lexicographical work of the first order, which is still consulted by scholars, and can never be opened without admiration for the range and precision of the author's scholarship and the soundness of his philological method. There is more Hebrew to be learned from Abu 'l Walíd than from all the later rabbins put together. Abu 'l Walíd was essentially a philologist. He had essayed poetry in his youth, was read in philosophy, and not only practised as a physician but wrote on medicine; but the devotion of his life was concentrated on the exact verbal study of Scripture. Armed with a thorough knowledge of the language and grammatical system of the Arabs, as well as of the dialects of Jewish Aramaic, he studied the Biblical idiom in the light of the cognate Semitic tongues, and in a spirit of pure scholarship, free from traditional prejudice.

The extant minor works of R. Jonah have been published in Arabic with a French translation by J. and H. Derenbourg, *Opuscules et Traités d'Abou'l-Walíd*, Paris, 1880. The first or grammatical part of the *Kitáb el-Tanḳíḥ* has been published in the imperfect Hebrew version entitled *Sefer Hariḳma* by Goldberg, Frankfort-on-the-Main, 1856. The lexicographical part of the *Kitáb el-Uṣúl*, or *Book of Roots*, was published in Arabic by Neubauer, Oxford, 1875. For further details as to the life and works of Abu 'l-Walíd see Munk's articles in *Journal Asiatique*, 1850, 1851; and Derenbourg, *op. cit.*

JONAS, Justus (1493–1555), a German Protestant Reformer, was born at Nordhausen in Thuringia, 5th June, 1493. In 1506 he entered the university of Erfurt, where he graduated in law in 1516; but, having been converted to the doctrines of Luther, he, about 1519, resolved to study theology. In 1521 he accompanied Luther to the diet of Worms. The same year he was appointed professor of canon law at Wittenberg, where shortly afterwards he became doctor in theology, and occupied himself much in preaching. During the next twenty years he took part in many church visitations and conferences, and translated into German several of the works of Luther and Melanchthon. In 1541 he became superintendent of the churches at Halle, whence he was banished by the elector Maurice of Saxony in 1546. He returned for a short time in 1547 and again in 1548, but was unable to resume his interrupted tasks; after a short stay at Jena, where he had some share in the ordering of the new university, he became court-preacher at Coburg in 1551. In 1553 he was called as first pastor to Eisfeld, where he died, 9th October, 1555. Among the theological tractates of Jonas is *Discussio pro conjugio sacerdotali*, 1523. He also wrote an account of the proceedings of the conference of Marburg.

See Reinhard, *De Vita et obitu Justi Jonæ*, 1713; Knapp, *Narratio de Justo Jona*, 1817; and the life by Hasse in Meurer's *Leben der Altväter der luth. Kirche*, 1864.

JONES, Inigo (*c.* 1572–1651), an English architect, sometimes called the "English Palladio," was the son of a cloth-worker, and was born in London about 1572. It is stated that he became apprenticed to a joiner, but at any rate his talent for drawing attracted somehow the attention of a nobleman, by some affirmed to have been the earl of Arundel, by others the earl of Pembroke, who sent him to study landscape-painting in Italy. His preference soon transferred itself to architecture, and, following chiefly the style of Palladio, he acquired at Venice such considerable reputation that in 1604 he was invited by Christian IV. to Denmark, where he is said to have designed the two great royal palaces of Rosenborg and Frederiksborg. In the following year he accompanied Anne of Denmark to the court of James I. of England, where, besides being appointed architect to the queen and Prince Henry, he was employed in supplying the designs and decorations of the court masques. After a second visit to Italy in 1612, Jones was appointed surveyor-general of the royal buildings by James I., and was engaged to prepare designs for a new palace at Whitehall. In 1620 he was employed by the king to investigate the origin of Stonehenge, when he came to the absurd conclusion that it had been a Roman temple. Shortly afterwards he was appointed one of the commissioners for the repair of St. Paul's, but the work was not begun till 1633. Under Charles I. he enjoyed the same offices as under his predecessor, and in the capacity of designer of the masques he came into collision with Ben Jonson, who on this account has frequently made him the butt of his satire. After the civil war Jones was forced to pay heavy fines as a courtier and malignant. He died in poverty, July 5, 1651.

A list of the principal buildings designed by Jones is given in Dallaway's edition of Walpole's *Anecdotes of Painting*, and for an estimate of him as an architect see the article Architecture, vol. ii. p. 387, and also Ferguson's *History of Modern Architecture*. The *Architecture of Palladio*, in 4 books, by Inigo Jones, appeared in 1715; *The Most Notable Antiquity of Great Britain, called Stonehenge, restored by Inigo Jones*, in 1655 (an edition, with memoir, 1725); the *Designs of Inigo Jones*, by W. Kent, in 1727; and *The Designs of Inigo Jones*, by J. Ware, in 1757.

JONES, John Paul (1747–1792), was born July 6, 1747, on the estate of Arbigland, in the parish of Kirkbean and the stewartry of Kirkcudbright, Scotland, where his father, John Paul, was gardener. At twelve he went to sea as apprentice to a merchant of Whitehaven, in whose ships he visited America several times. He became a skilful sailor, and was for some time mate of a slaver in the West Indies. On

his way back to England, after leaving the slave trade in disgust, the captain and mate of the ship in which he was both died; and the skilful manner in which Paul Jones brought the ship safely into port induced the owners to appoint him captain. In 1773, having for some unknown reason assumed the cognomen Jones, he settled in Virginia, on a property which had fallen to him on the death of an older brother. When the American war of independence broke out two years later, Jones took up arms for the colonies, and accepted a command in the navy of the new republic. He did good service against his native land, and in 1777 was sent to France to receive a more important command. Disappointed in that, he sailed in 1778 to the English coast in his ship "Ranger," and availed himself of his early knowledge to land at Whitehaven, where, however, he was unsuccessful in his attempt to fire the shipping. Next year he sailed on a similar expedition in the "Bonhomme Richard," along with other vessels, and, steering up the Firth of Forth, was only prevented by a strong westerly gale from attacking Leith. On his way south again he fell in, off Flamborough Head, with the English ship "Serapis," which after a long and bloody combat he compelled to strike. That exploit raised his fame to its acme. On his return to Paris he was fêted and caressed by the best society; and Louis XVI. presented him with a gold-hilted sword, and decorated him with the military Order of Merit. After some time spent in America, where he was much chagrined by the neglect that met his boastful requests for further employment, Paul Jones returned to Paris as agent for all prizes taken in Europe under his own command, While he resumed his efforts to pose as a man of *ton*, he attended carefully to his duties. A favorable report to Congress as to his naval services was followed by a vote of a gold medal from that body in 1786. In 1788 the Chevalier Jones entered the service of the empress Catherine of Russia, and became as enthusiastic a Russian as he had been an American. He was appointed to a command in the Black Sea, with the rank of rear-admiral, to act against the Turks; but the jealousy and rivalry of the Russian commanders brought about his recall in less than eight months. Summoned to St. Petersburg, on pretext of receiving a post in the North Sea, he was left in restless idleness, until at last two years' formal leave of absence was granted him. On this virtual dismissal, Paul Jones retired to Paris, soured and disappointed; and after two years spent in fruitlessly importuning the Russian court, he died in that city on July 18, 1792.

Paul Jones is described as a "short, thick, little fellow, about 5 feet 8 inches in height, of a dark swarthy complexion." Naval skill and bravery he certainly had, but his letters prove him to have been boastful and quarrelsome. He writhed under the suspicion of being "an adventurer;" once and again he eagerly repels the charge. English contemporary accounts generally speak of him as a pirate; and, though he certainly ranked as an officer of the United States, the independent manner in which he cruised might well suggest letters of marque rather than a Government commission.

The life of Paul Jones has given rise to much romance. Cooper, Dumas, and Allan Cunningham have celebrated him in their novels; and scarcely less fictitious are some of his so-called biographies. The most authentic seems to be the *Memoirs of Paul Jones*, 2 vols., Edinburgh, 1830.

JONES, Owen (1741–1814), a Welsh antiquary, was born in 1741 at Llanvihangel Glyn y Myvyr in Denbighshire, and died, September 26, 1814, in Thames Street, London. Introduced in 1760 to the service of a London firm of furriers (Kidney & Nutt), he ultimately succeeded to their business, and continued to carry it on with success till his death. His fancy had been fired in boyhood with a passion for the poetry of his country, and when wealth and leisure were attained, he devoted them both to the acquisition of the ancient monuments of the art. Assisted by Edward William of Glamorgan (Iolo Morganwg), and Dr. Owen Pughe, he published, at a cost of more than £1000, the well-known *Myvyrian Archaiology of Wales* (Lond., 1801–7, 3 vols.), a great collection of pieces dating from the 6th to the 14th century. The manuscripts which he had brought together are now deposited in the British Museum,—the material not utilized in the *Myvyrian Archaiology* amounting to 100 volumes containing 16,000 pages of verse and 15,300 pages of prose. Jones was the founder of the Gwyneddigion Society (1772) in London for the encouragement of Welsh studies and literature; and he commenced in 1805 a miscellany—the *Greal*—of which, however, only one volume appeared. An edition of the poems of Davydd ab Gwilym was also issued at his expense. A new edition of the *Myvyrian Archaiology* was published at Denbigh in 1870.

JONES, Owen (1809–1874), architect and art-decorator, son of the subject of last notice, was born in London in 1809. After an apprenticeship of six years in an architect's office, he travelled for four years in Italy, Greece, Turkey, Egypt, and Spain, making a special study of the Alhambra in the last-mentioned country. On his return to England in 1836 he busied himself in his professional work. His forte was interior decoration, for which his formula was—"form without color is like a body without a soul." He was one of the superintendents of works for the Exhibition of 1851; and, as director of decorations for the Crystal Palace at Sydenham, he arranged the Egyptian, Greek, Roman, and Alhambra courts, besides being responsible for the general decoration of the whole building. Along with Mr. (afterwards Sir Digby) Wyatt, Jones collected the casts of works of art on the Continent which adorn the different courts. In his later years he was much engaged in the decoration of private houses, among which may be reckoned the viceroy of Egypt's palace at Gesch. In 1857 he received the royal medal for architecture; and after other distinctions, he was awarded a diploma of honor at the Vienna Exhibition of 1873. He died in London, April 19, 1874.

Owen Jones is described in *The Builder* for 1874 as "the most potent apostle of color that architectural England has had in these days." His range of activity is to be traced in his works: *Plans, Elevations, and Details of the Alhambra* (1835–45), in which he was assisted by MM. Goury and Gayangos; *Designs for Mosaic and Tesselated Pavements*, 1842; *Polychromatic Ornament of Italy*, 1845; *An Attempt to define the Principles which regulate the Employment of Color in Decorative Arts*, 1852; *Handbook to the Alhambra Court; Grammar of Ornament*, fol., 1856, a very important work; *One Thousand and One Initial Letters*, 1864; *Seven Hundred and Two Monograms*, 1864; and *Examples of Chinese Ornament*, 1867.

JONES, Sir William (1746–1794), one of the most accomplished linguists and Oriental scholars that England has produced, was born in London, September 28, 1746. When seven years old he was sent to Harrow, where he soon far excelled all his school-fellows in every branch of study. But the classical routine of a public school failed to satisfy the ardent thirst for knowledge displayed by the boy from his earliest childhood. He accordingly began to apply himself, during the last three years of his life at Harrow, to the study of Oriental languages, teaching himself the rudiments of Arabic, and becoming sufficiently familiar with Hebrew to be able to read that language with tolerable ease. The greater part of his vacations he devoted to the improvement of his acquaintance with French and Italian by assiduously practising composition in those tongues. In 1764 young Jones went to Oxford and entered University College, where he continued to prosecute his studies with unabated vigor. Though obliged to give up a considerable portion of his time to the classical studies required by the university course, he still directed his attention chiefly to Oriental literature, particularly to Persian and Arabic. In acquiring

the latter language he received effective assistance from a Syrian named Mirza, whom he discovered in London and brought with him to Oxford. Meanwhile, however, not content with all this work, he managed to make considerable progress in Italian, Spanish, and Portuguese. At nineteen he left Oxford to become tutor to Earl Spencer's eldest son, and remained with that nobleman's family for five years. In 1766 Jones obtained a fellowship which placed him in a position of independence, and enabled him to give his undivided attention to his linguistic pursuits. On his return from a short visit to the Continent, where he picked up some knowledge of German, he began the study of Chinese, and made himself master of the radical characters of that language. Though not more than twenty-two years of age, he was already becoming famous for his acquirements as a linguist and Oriental scholar. Accordingly when Christian VII., king of Denmark, visited England in 1768, bringing with him a life of Nadir Shah in Persian, Jones was requested to render the MS. into French. He agreed, and the translation appeared in 1770, with an introduction containing a description of Asia and a short history of Persia (2 vols. 8vo., new ed., 1790). This was followed in the same year by a treatise in French on Oriental poetry, and by a metrical translation, in the same language, of the odes of Hafiz.

For some time Jones had been thinking of taking up the law as a profession, and, having now finally decided on doing so he became a member of the Temple. About this time the French Orientalist, Anquetil Du Perron, published his translation of the *Zend Avesta*, in the introduction to which he made an unjustifiable attack on Oxford. Jones taking on himself the defence of his university, addressed an anonymous letter in French to Du Perron, in which he convicted that scholar of unwarrantable invective and wilful misrepresentation. It is a remarkable proof of Jones's great talent for languages that the racy and idiomatic style of the French in this pamphlet led several foreign *savans* to attribute it to the pen of some *bel esprit* of the French capital. In the same year appeared his grammar of the Persian language (9th ed., with corrections and additions by Samuel Lee, D.D., Lond., 1828), which is still considered one of the best text-books on the subject. In 1772 Jones published a small volume of poems, chiefly translations from Asiatic languages, together with two elegant essays on the poetry of Eastern nations and on the arts commonly called imitative. His next publication, which appeared in 1774, was a treatise entitled *Poeseos Asiaticæ commentariorum libri sex*, the chief aim of which was to familiarize the European mind with the genius of Oriental poetry.

Being now admitted to the bar, Jones determined to give up all his energies to his legal studies, and renounced polite literature for some years. Setting to work with the same eagerness which he displayed in the pursuit of all other kinds of knowledge, he made it his endeavor, not merely to master the technicalities of law, but to devote himself to it as a branch of philosophy. Having within two years acquired a considerable legal reputation, he was in 1776 appointed commissioner of bankrupts. In 1780 he was induced by his friends to come forward as a candidate for the representation of the university of Oxford in parliament, but he withdrew from the contest before the day of election, as he found he had no chance of success, owing to the liberal principles he held, especially on the questions of the American war and of the slave trade.

In the winter of 1780–81 he found leisure to complete his translation of the seven ancient Arabic poems called *Moallakât*. Besides writing an *Essay on the Law of Bailments*, Jones translated in 1781 the speeches of Isæus on the right of inheritance, and an Arabian poem on the Mahometan law of succession to the property of intestates, as bearing on his legal studies.

The hopes which he had for some time entertained of obtaining a seat on the judicial bench in Bengal, were at last gratified on the accession to power of the Shelburne administration, by which he was in 1783 appointed a judge of the supreme court of judicature at Fort William, at the same time receiving the honor of knighthood. Shortly after his arrival in Calcutta he founded, in January, 1784, the Asiatic Society, of which he remained president till his death. Convinced as he was of the great importance of consulting the Hindu legal authorities in the original, he lost no time in commencing the study of Sanskrit. Having in a few years made himself complete master of the language, he undertook, in 1788, the task of compiling a digest of Hindu and Mahometan law, the completion of which he did not live to see; the work was finished, however, by Colebrooke, who edited it at Calcutta in 1800 under the title of *Digest of Hindu Laws*. In 1789 Sir William Jones published the first volume of *Asiatic Researches* and his translation of *Sakuntalâ*, the most famous play of Kâlidâsa, the greatest Indian dramatist. He also translated the well-known collection of fables entitled the *Hitopadeça*, the *Gîtagovinda*, an erotic poem by Jayadeva, and considerable portions of the Veda, besides editing the text of the *Ritusamhâra*, a short but celebrated poem by Kâlidâsa. His last work, which appeared in 1794, was the translation of the *Institutes of Manu*, a compilation of laws and ordinances, dating from the 5th century, B.C. Sir William's unremitting literary labors, together with the conscientious performance of his heavy judicial work, could not fail to tell on his health after a ten years' residence in the climate of Bengal; and he was about to return to England when a sudden attack of inflammation of the liver carried him off in the forty-eighth year of his age (April 27, 1794).

The amount of labor of various kinds which Sir William Jones compressed into the space of a comparatively short life seems almost incredible. In addition to numerous other acquirements, he knew thirteen languages well, and had an elementary acquaintance with twenty-eight others. His capacity for assimilating and reproducing knowledge of every sort was almost unparalleled. But his works, though they display a vast amount of learning, do not bear the stamp of genius. He shows no originality either in discovering new truths or in placing old truths in a new light. Had he concentrated his powers, his extraordinary industry might have secured him greatness in some one branch of knowledge; but their diffusion over too great a surface contributed greatly to that weakness which is so manifest both in his style and in his critical faculty. His chief claim to the remembrance of posterity will rest on the fact that by founding the Asiatic Society he rendered the language and literature of the ancient Hindus accessible to European scholars, and thus became the indirect cause of the splendid achievements in the field of Sanskrit and comparative philology which the present century has witnessed.

Sir William Jones's complete works were edited in 1799 (6 vols. 4to), and reprinted in 1807 (13 vols. 8vo). Lord Teignmouth published memoirs of his life, writings, and correspondence in 1807 (new ed. 1835, 2 vols. 8vo); and an autobiography, published by his son, was printed in 1846. (A. A. M.)

JONES, WILLIAM (1726–1800), a divine of the Church of England, and one of the principal followers of John Hutchinson, was born at Lowick, Northamptonshire, July 30, 1726. By his father's side he was descended from an old Welsh family, and one of his progenitors was Colonel Jones, brother-in-law of Cromwell. He was educated at Charterhouse school, from which he received an exhibition to University College, Oxford. There a kindred taste for music, as well as a similarity in regard to other points of character, led to his close intimacy with George Horne, afterwards bishop of Norwich, who chiefly through his arguments was induced to embrace Hutchinsonian doctrines. After obtaining his bachelor's degree in 1749, Jones was curate successively at Finedon and Waddenhoe in Northamptonshire. In 1764 he was presented to the vicarage of Bethersden in Kent, and shortly afterwards to the rectory of Pluckley in the same county, where

he took up his residence. In 1776 he removed to Nayland, Suffolk, of which he obtained the perpetual curacy, and, although in 1798 he became rector of Hollingbourn, Kent, he continued to reside at Nayland till his death, 6th January, 1800.

In 1756 Jones published his tractate *On the Catholic Doctrine of the Trinity*, a statement of the doctrine from the Hutchinsonian point of view, with a succinct and able summary of Scriptural proofs. This was followed in 1762 by an *Essay on the First Principles of Natural Philosophy*, in which he maintained the theories of Hutchinson in opposition to those of Sir Isaac Newton, and in 1781 he gave a more extended exposition of his opinions in *Physiological Disquisitions*. Among his other works are—*Lectures on the Figurative Language of the Holy Scripture*, 1786; *The Scholar Armed*, 1792; and a life of Bishop Horne, prefixed to Horne's collected *Works*, 1795. Jones was also the originator of the *British Critic*, the first number of which appeared in May, 1793. His collected works, with a life by W. Stevens, appeared in 1801, in 12 vols., and his theological and miscellaneous works with life were reprinted in 1810. Since that time various editions of his works have appeared, as well as some volumes of his sermons. A life of Jones, forming part 5 of the *Biography of English Divines*, was published in 1849.

JÖNKÖPING, a town of Sweden, at the head of the län of the same name, in 57° 48′ N. lat., about 170 miles southwest of Stockholm, and 80 east of Gothenburg. It occupies a beautiful but somewhat unhealthy position in a valley between the southern end of Lake Wetter and two smaller lakes known as the Rocksjö and the Munksjö; the very names, indeed, of two parts of the town, the Tyska Mad and the Svenska Mad, refer to the time when the site was a marsh and the buildings had to be erected on piles. The church of St. Christina, dating from 1649–1673, the supreme court (built as a private enterprise in 1665), the townhouse (rebuilt after the conflagration of 1691), the buildings of the provincial administration, the artillery barracks, a theatre, and the high school are the more noteworthy edifices. Jönköping is well known as the seat of a great safety-match factory, which produced in 1860 upwards of 35,000,000 boxes, of the value of £11,390, while in 1874 the value reached the sum of £150,000, It also contains snuff and cigar factories, an asphalt factory, dye-works, damask factories, and a variety of minor establishments. The population, which has been steadily increasing, numbered 23,143 in 1900.

Jönköping is mentioned as early as 1284 or 1288, and the castle in 1263, when Waldemar Birgersson married the Danish princess Sophia. It was afterwards the scene of many events of moment in Scandinavian history:—the parliaments of 1357, 1439, and 1599; the meeting of the Danish and Swedish plenipotentiaries in 1448; and the death of Sten Stura, the elder, in 1503. In 1612 Gustavus Adolphus caused the inhabitants to destroy their town lest it should fall into the hands of the Danes; but it was rebuilt soon after, and in 1620 received special privileges from the king. It was from the Dutch and German workmen, introduced at this time, that the quarter Tyska Mad received its name. In 1809 the plenipotentiaries of Sweden and Denmark concluded peace in the town.

JONSON, Ben (for thus his Christian name was usually abbreviated by himself and his contemporaries, and thus, in accordance with his famous epitaph, it will always continue to be abbreviated by posterity), was born about the beginning (N. S.) of the year 1573. By the poet's account his grandfather had been a gentleman who "came from" Carlisle, and originally, the grandson thought, from Annandale, where Johnstons or Johnstones appear to have abounded, and where indeed at least one resident of that name is noticed in the reminiscences of a later native of the border district resembling Ben himself in the quickness of his temper and in his impatience of pretences and pretenders,—the late Thomas Carlyle. Ben Jonson further related that he was born a month after the death of his father, who, after suffering in estate and person under Queen Mary, had in the end "turned minister." Two years after the birth of her son the widow married again; she may be supposed to have loved him in a passionate way peculiar to herself, since on one occasion we shall find her revealing an almost ferocious determination to save his honor at the cost of both his life and her own. Jonson's stepfather was a master bricklayer in or near Westminster, who—whether or not he afterwards constrained his stepson, while acquainting himself with the business into which he had been admitted, to undergo the degradation of laying a few bricks with his own trowel—certainly allowed him to lay for himself the foundations of a good education. After attending a private school in the neighborhood, he was sent to Westminster school,—nor is it at all obvious why the master bricklayer should have been denied the credit of having sent him there. Jonson's gratitude, however, for an education to which in truth he owed an almost inestimable debt, concentrated itself upon the "most reverend head" of the illustrious Camden, then second and afterwards head master of the famous school, and the firm friend of his pupil in later life.

After reaching the highest form at Westminster, Jonson is stated, but on unsatisfactory evidence, to have proceeded to the university of Cambridge; but at the utmost he can only have made a transitory appearance in a scene of which as a painter of men and manners he nowhere reproduces a single feature. And doubtless he felt that neither his crop of learning and experience nor his wild oats were yet fully sown, when, goose quill or other implement in hand, he had to apply himself to the family business. He soon had enough of it, and was soldiering in the Netherlands, much to his own subsequent satisfaction when the days of self-conscious retrospect arrived, but to no further purpose beyond that of seeing something of the world. By the middle of 1597 we at last come across documentary evidence of him at home in London, in the shape of an entry in Henslowe's diary on July 28th of 3s. 6d. "received of Bengemenes Johnsones share." He was therefore by this time, when Shakespeare, his senior by nearly nine years, was already in prosperous circumstances and good esteem, at least a regular member of the profession, with a fixed engagement in the Lord Admiral's company, then performing under the experienced Henslowe's management at the Rose. The traditions may very possibly be true according to which he had previously acted at the Curtain (a former house of the Lord Admiral's men), and "taken mad Jeronimo's part" as a stroller. This latter appearance would in that case have probably been in *The Spanish Tragedy*, since in *The First Part of Jeronimo* Jonson would have had to dwell on the "smallness" of his "bulk." He was at a subsequent date (1601) employed by Henslowe to write up *The Spanish Tragedy*, in pursuance of a fashion differing from that of later times, when old plays have more usually been written *down* to the taste of modern audiences. Jonson's additions, which were not the first changes made in the play, are usually supposed to be those printed with *The Spanish Tragedy* in the edition of 1602; Charles Lamb's doubts on the subject are an instance of that subjective kind of criticism in which it is unsafe to put absolute trust.

Ben Jonson may be supposed to have married two or three years before the date of Henslowe's first entry of his name. Of his wife he afterwards spoke with scant enthusiasm, and for one (undated) interval of five years he preferred to live without her. Long burnings of "oil" among his books, and long spells of recreation at the tavern, such as Jonson loved, are not the most favored accompaniments of family life. But Jonson was no stranger to the tenderest of affections; two at least of the several children whom his wife bore to him he commemorated in touching little tributes of verse; nor in speaking of his lost eldest daughter did he forget "her mother's tears."

Within a year's time, or little more, from the date

at which we first find Ben Jonson in well-authenticated connection with the English stage, he had produced one of the most memorable plays in its history. *Every Man in his Humor*, the original example of a species of English comedy which cannot be said to have become altogether extinct even with the Restoration, was first acted in 1598—probably in the earlier part of September—by the Lord Chamberlain's company, which was then still performing at the so-called Theatre, and in which Shakespeare was just on the eve of acquiring one or more shares. He certainly was one of the actors in Jonson's comedy, and it is in the character of Old Knowell in this very play that, according to a bold but ingenious guess, Shakespeare is represented in the half-length portrait of him in the folio of 1623, beneath which were printed Jonson's lines concerning the picture. *Every Man in his Humor* was probably followed by *The Case is Altered*, which was certainly acted by 1599, and which contains a satirical attack upon the pageant poet Anthony Munday. Inasmuch as the earlier of these two comedies was indisputably successful, and as Jonson's reputation was already sufficient to ensure him a mention in the *Palladis Tamia* of Francis Meres, published in the same year, 1598, as one of the chief writers in tragedy (on the strength of what play or plays is unknown), it was an awkward fatality that before the year was out he should have found himself in prison and in danger of the gallows. He had had the misfortune of killing in a duel, fought in Hogsden Fields, for some cause unknown, an actor of Henslowe's company named Gabriel Spenser; possibly Henslowe's uncourteous designation of Jonson as a "bricklayer" may imply that the success of the new comedy at the other house had not been a subject of congratulation at that to which its author had formerly belonged. In prison Jonson was visited by a Roman Catholic priest—a prison being the most likely place in which to meet a priest in those days; and the result was his conversion to the Church of Rome, to which he adhered for twelve years. Jonson was afterwards a diligent student of divinity; but, though his mind was religious, it is not probable that its natural bias much inclined it to dwell upon creeds and their controversies. Though in prison spies were set upon him, which was then thought to be an admirable method for expediting justice, yet his judges (he afterwards boasted) could get nothing out of him but "aye" or "no." And thus after a short imprisonment he was released, some time early in 1599, in which year he is found back again at work for Henslowe, receiving, together with Dekker, Chettle, and "another gentleman," earnest-money for a tragedy called *Robert II., King of Scots*. It is of more importance that in the same year he brought out through the Lord Chamberlain's company (possibly already at the Globe, then newly built or building) the elaborate comedy of *Every Man out of his Humor*,—a work which subsequently had the honor, for which it was in some respects specially fitted, of being presented before Queen Elizabeth. The sunshine of court favor, rarely diffused during her reign in rays more than metaphorically golden, was not to bring any material comfort to the most learned of her dramatists, before the inevitable hand was laid upon her of which his courtly epilogue had besought death to forget the use. Indeed, of his *Cynthia's Revels* (1600), no doubt primarily designed as a piece of unctuous flattery to the address of the queen, the most marked result had been to offend two playwrights of note with whom he had formerly worked in company—Dekker, who had a coarse and healthy grip of his own, and Marston, who was perhaps less dangerous by his strength than by his versatility. Learning their intention, or at least that of Dekker, to wreak literary vengeance upon him, he seems to have sought to anticipate its effect by covering them with contemptuous ridicule beforehand. *The Poetaster* (1601), which he states to have been completed fifteen weeks after the plot of it was first conceived, did not, however, silence his adversaries; it rather gave them the opportunity of the last word, which Dekker took in producing his *Satiromastix, or the Untrussing of the Humorous Poet* (1602). There was indeed an attempt at some more last words on Jonson's part; but on the whole he appears to have thought (and very wisely) that the time for a season of silence had arrived for him as a court poet. According to a statement by Overbury, early in 1603, "Ben Johnson, the poet, now lives upon one Townesend"—who this generous patron was we do not know—"and scornes the world." That, however, he was not sulking in the friendly tent with which he had been accommodated is shown by the fact that in this year (1603) was produced at the Globe the earlier of his two extant tragedies, *Sejanus*,—Shakespeare once more taking a part in the performance.

Meanwhile, in the year which dates the tragedy concerning the fall of the great favorite, there had begun a reign in England destined to be remembered as that of favorites hardly less hated than he. Adulatory loyalty seemed intent on showing that it had not exhausted itself at the feet of Gloriana, and Jonson's well-stored brain and ready pen had their share in devising and executing ingenious variations on the theme "Welcome—since we cannot do without thee!" It is very remarkable how promptly his genius, which it is sheer prejudice to describe as wanting in flexibility and lightness, suited itself to the sudden demands of the new taste for masks and entertainments—new of course in degree rather than in kind—introduced with the new reign. The pageant which on the 7th of May, 1603, bade the king welcome to a capital dissolved in joy was partly of Jonson's partly of Dekker's devising; and, having thus been prominently brought into notice, he was able to deepen and diversify the impression by the composition of masks presented to James I. when entertained at houses of the nobility. He was soon occasionally employed by the court itself,—already in 1606 in conjunction with Inigo Jones as responsible for the "painting and carpentry,"—and thus speedily showed himself master in a species of composition to which he, more than any other of our poets before Milton, secured an enduring place in our national poetic literature. Personally, no doubt, he derived considerable material benefit from the new fashion, very valuable to poets in days when there were no monthly magazines,—more especially if his statement to Drummond was anything like correct, that out of his plays he had never gained a couple of hundred pounds.

Good humor seems to have come back with good fortune. Joint employment had reconciled him with Dekker; and with Marston also he was again on good terms. When therefore, in 1604, the latter and Chapman (who, Jonson told Drummond, was loved of him, and whom he had probably honored as "Virgil" in *The Poetaster*) produced the excellent comedy of *Eastward Ho*, it appears to have contained some contributions by Jonson; at all events, when the authors were arrested on account of one or more passages in the play which were deemed insulting to the Scotch, he voluntarily imprisoned himself with them. They were soon released, and a banquet at his expense, attended by Camden and Selden, terminated the incident. If Jonson is to be believed, there had been a report that the prisoners were to have their ears and noses cut, and, with reference apparently to this peril, "at the midst of the feast his old mother drank to him, and showed him a paper which she had intended (if the sentence had taken execution) to have mixed in the prison among his drink, which was full of lusty strong poison; and that she was no churl, she told him, she minded first to have drunk of it herself." Strange to say, in 1605 Jonson and Chapman, though the former, as he averred, had so "attempered" his style as to have "given no cause to any good man of grief," were again in prison on account of a "play"; but they appear to have been once more speedily set

free, in consequence of the (very manly and dignified) letter addressed by Jonson to the earl of Salisbury. In the same year he played a part—which had till recently remained unknown, and is still in some measure obscure—in the mysterious history of the Gunpowder Plot. On November 7th, very soon after the discovery of the conspiracy, whose threads it became the immediate duty of the council to unravel, that body appears to have sent for Ben Jonson, at the advice no doubt of Salisbury, who (as has just been seen) knew of Jonson; indeed, the latter has been supposed to have given his support as a dramatist to the party headed by Robert Cecil before Queen Elizabeth's death. As a loyal Roman Catholic Jonson was asked, and undertook to give, his good offices in inducing the priests to do something required by the council,—one hardly likes to conjecture it to have been some tampering with the secrets of confession. In any case, the negotiations fell through, because the priests declined to come forth out of their hiding-places to be negotiated with—greatly to the wrath of Ben Jonson, who declares in a letter to Lord Salisbury that "they are all so enweaved in it that it will make 500 gentlemen less of the religion within this week, if they carry their understanding about them." Jonson himself, however, did not declare his separation from the Church of Rome for five years longer, however much it might have been to his advantage to do so.

His powers as a dramatist were at their height during the earlier half of the reign of James I.; and by the year 1616 he had produced nearly all the plays which are worthy of his genius. They include the tragedy of *Catiline* (1611), which achieved only a doubtful success, and the comedies of *Volpone* or *The Fox* (acted 1605), *Epicœne* or *The Silent Woman* (1609), the *Alchemist* (1610), *Bartholomew Fair* (1614), and *The Devil is an Ass* (1616). During the same period he produced several masks, usually in connection with Inigo Jones, with whom, however, he seems to have quarrelled already in this reign, though it is very doubtful whether the architect is really intended to be ridiculed in *Bartholomew Fair* under the character of Lanthorn Leatherhead. In 1616 a modest pension of 100 marks a year was conferred upon him; and possibly this mark of royal favor may have encouraged him to the publication of the first volume of the folio collected edition of his works (1616).

He had other patrons more bountiful than the crown, and for a brief space of time (in 1613) had travelled to France as governor to the eldest son of Sir Walter Ralcigh, then a state prisoner in the Tower, for whose society Jonson may have gained a liking at the Mermaid Tavern in Cheapside, but for whose moral character he, like so many of his contemporaries, seems to have had but small esteem. Thus in the year 1616 Jonson seems to have made up his mind to cease writing for the stage, where neither his success nor his profits had equalled his merits and expectations. He continued to produce masks and entertainments when called upon; but he was attracted by many other literary pursuits, and had already accomplished enough to furnish plentiful materials for retrospective discourse over pipe or cup. He was already entitled to lord it at the Mermaid, where his quick antagonist in earlier wit-combats no longer appeared even on a visit from his comfortable retreat at Stratford. That on the other hand Ben carried his wicked town habits into Warwickshire, and there, together with Drayton, made Shakespeare drink so hard with them as to bring upon himself the fatal fever which ended his days, is a bit of petty scandal with which we may fairly refuse to load his memory.

It was in the year 1618 that Ben Jonson, like his great namesake, a century and a half afterwards, resolved to have a real holiday for once, and about midsummer started for his ancestral country, Scotland. He had (very heroically for a man of his habits) determined to make the journey on foot; and—imitation is the sincerest kind of flattery—was speedily followed by John Taylor, the water-poet, who still further handicapped himself by the condition that he would accomplish the pilgrimage without a penny in his pocket. Jonson (who put money in his good friend's purse when he came up with him at Leith) spent more than a year and a half in the hospitable Lowlands, being solemnly elected a burgess of Edinburgh, and on another occasion entertained at a public banquet there. But the best remembered hospitality which he enjoyed was that of the learned and refined Scottish poet Drummond of Hawthornden, to which we owe the so-called *Conversations*. In these famous jottings, the work of no extenuating hand, Jonson lives for us to this day, delivering his censures freely in praise and blame, but by no means generously described in the postscript added by his exhausted host as "a great lover and praiser of himself, a contemner and scorner of others." A poetical account of this journey, "with all the adventures," was burnt with Jonson's library.

After his return to England Jonson appears to have resumed his former course of life. In 1619 his visits to the country seats of the nobility were varied by a sojourn at Oxford with Corbet at Christ Church, on which occasion a master's degree was conferred upon him by the university. He confessed about this time that he was or seemed growing "restive," *i.e.*, lazy, though it was not long before he returned to the occasional composition of masks. The extremely spirited *Gipsies Metamorphosed* (1621) was thrice presented before the king, who was so pleased with it as to grant to the poet the reversion of the office of master of the revels, besides proposing to confer upon him the honor of knighthood. This honor Jonson (hardly in deference to the memory of Sir Petronel Flash) declined, but there was no reason why he should not gratefully accept the increase in his pension, which was in the same year (1621) raised to 200 marks. Yet the close of king James I.'s reign found the foremost of the poets of the time in anything but a prosperous condition. It would be unjust to hold "The Sun," "The Dog," "The Triple Tun," or the "Old Devil," with its Apollo club-room, where Ben's supremacy must by this time have become established, responsible for this result; taverns were the clubs of that day, and a man of letters is not considered lost in our own because he "haunts" a smoking-room in Pall Mall. Disease had weakened the poet's strength, and the burning of his library, as his *Execration upon Vulcan* sufficiently shows, must have been no mere transitory trouble to a poor man of letters. He thus thought it best to recur to writing for the stage, and in 1625 produced, with no faint heart, but with a very clear anticipation of the comments which would be made upon the reappearance of the "huge, overgrown play-maker," *The Staple of News*, a comedy excellent in some respects, but little calculated to become popular. In 1628, on the death of Middleton, some interest obtained for him the appointment of city chronologer, with a salary of 100 nobles a year—an office of which he appears to have considered the duties as purely ornamental, inasmuch as in 1631 his salary was suspended until he should have presented some fruits of his labors in his place, or—as he more succinctly phrased it—"yesterday the barbarous court of aldermen have withdrawn their chandlerly pension for verjuice and mustard, £33 6s. 8d." After being in 1628 arrested by mistake on the utterly false charge of having written certain verses in approval of the assassination of Buckingham, he was soon allowed to return to Westminster, where it would appear from a letter of his "son and contiguous neighbor," James Howell, he was living in 1629, and about this time narrowly escaped another conflagration. In the same year (1629) he once more essayed the stage with the comedy of *The New Inn*, which was actually, and on its own merits not unjustly, damned on the first performance. The epilogue dwelt not without dignity upon the neglect which the poet

had experienced at the hands of "king and queen;" and it is honorable to King Charles I. that he should not only have immediately sent the unlucky author a gift of a hundred pounds, but on receiving another more cheerful versified appeal in response, should have increased his standing salary to the same sum, with the addition of an annual tierce of canary,—henceforth the poet-laureate's customary royal gift. But though he afterwards composed one or two little entertainments, and even a comedy or two, there seemed little power left in his palsy-stricken hand. The patronage of kind friends like the earl of Newcastle was never wholly wanting to him, nor could he have ended in neglect. He was the acknowledged chief of English literature, both at the festive meetings where he ruled the roost among the younger authors whose pride it was to be "sealed of the tribe of Ben," and by the avowal of grave writers, old or young, not one of whom would have ventured to dispute his pre-eminence. Nor was he to the last unconscious of the claims upon him which his position brought with it. When death came upon him on August 6, 1637, he left behind him an unfinished work of great beauty, the pastoral drama of *The Sad Shepherd*. For forty years, he said in the prologue, he had feasted the public; at first he could scarce hit its taste, but patience had at last enabled it to identify itself with the working of his pen.

We are so accustomed to think of Ben Jonson presiding, attentive to his own applause, over a circle of youthful followers and admirers, that we are apt to forget the hard struggle which he had passed through before gaining the crown now universally acknowledged to be his. Howell records, in the year before Ben's death, that at a solemn supper at the poet's own house, where the host had almost spoiled the relish of the feast by vilifying others and magnifying himself, "T. Ca." (Thomas Carew) buzzed in the writer's ears "that, though Ben had barrelled up a great deal of knowledge, yet it seemed he had not read the *Ethics*, which, among other precepts of morality, forbid self-commendation." Self-reliance is but too frequently coupled with self-consciousness, and for good and for evil self-confidence was no doubt the most prominent feature in the character of Ben Jonson. Hence the combativeness which involved him in so many quarrels in his earlier days, and which jarred so harshly upon the gentler nature of Drummond. But his quarrels do not appear to have entered deeply into his soul, or indeed usually to have lasted long.[1] He was too exuberant in his vituperations to be bitter, and too outspoken to be malicious. He loved of all things to be called "honest," and there is every reason to suppose that he deserved the epithet. The old superstition, which may perhaps still linger here and there, hardly needs notice, according to which Jonson was filled with malignant envy of the greatest of his fellow-dramatists, and lost no opportunity of giving expression to it. Those who consider that Shakespeare was beyond the criticism of his contemporaries—as he certainly very frequently is above that of posterity—may find blasphemy in the saying of Jonson that Shakespeare "wanted art." Occasional jesting allusions to particular plays of Shakespeare may be found in Jonson, among which should hardly be included the sneer at *Pericles;* but these amount to nothing collectively, and to very little individually; and against them have to be set, not only the many pleasant traditions concerning the long intimacy between the pair, but also the noble lines, as noble as they are judicious, dedicated by the survivor to "the star of poets." But if Gifford had rendered no other service to Jonson's fame, he must be allowed to have once for all vindicated him from the cruelest aspersion which has ever been cast upon it. That in general Ben Jonson was a man of strong likes and dislikes, and was wont to manifest the latter as vehemently as the former, it would be idle to deny. He was at least impartial in his censures, dealing them out freely to Puritan poets like Wither and princes of his church like Cardinal Duperron. And, if sensitive to attack, he seems to have been impervious to flattery—to judge from the candor with which he condemned the foibles even of so enthusiastic an admirer as Beaumont. The personage that he disliked the most, and abused the most roundly to its face, was unfortunately one with many heads and a tongue to hiss in each,—no other than that "general public" which it was the radical mistake of his life to fancy he could "rail into approbation" before he had effectively secured its good-will. And upon the whole it may be said that the admiration of the few, rather than the favor of the many, has kept green the fame of the most independent among all the masters of an art which, in more senses than one, must please to live.

Jonson's learning and industry, which were alike exceptional, by no means exhausted themselves in furnishing and elaborating the materials of his dramatic works. His enemies sneered at him as a translator—a title which only a generation earlier would have been esteemed of all literary titles the most honorable. But his classical scholarship shows itself not only in his translations from the Latin poets (the *Ars Poetica* in particular), in addition to which he appears to have written a version of Barclay's *Argenis;* it was likewise the basis of his *English Grammar*, of which nothing but the rough draft remains (the MS. itself having perished in the fire in his library), and in connection with the subject of which he appears to have pursued other linguistic studies (Howell in 1629 is trying to procure him a Welsh grammar). And its effects are very visible in some of the most pleasing of his non-dramatic poems, which often display that combination of polish and simplicity hardly to be attained to—hardly even to be appreciated—without some measure of classical training.

Exclusive of the few lyrics in Jonson's dramas (which, with the exception of the stately choruses in *Catiline*, charm, and perhaps may surprise, by their lightness of touch), his non-dramatic works are comprised in the following collections. The book of *Epigrams* (published in the first folio of 1616) contained, in the poet's own words, the "ripest of his studies." His notion of an epigram was the ancient not the restricted modern one—still less that of the critic (R. C., the author of the *Times' Whistle*) in whose language, according to Jonson, "witty" was "obscene." On the whole, these epigrams excel more in encomiastic than in satiric touches, while the pathos of one or two epitaphs in the collection is of the truest kind. In the lyrics and epistles contained in the *Forest* (also in the first folio), Jonson shows greater variety in the poetic styles adopted by him; but the theme of love, which Dryden considered conspicuous by its absence in the author's dramas, is similarly eschewed here. The *Underwoods* (which were not published collectively till the second and surreptitious folio) are a miscellaneous series, comprising together with a few religious and a few amatory poems, a large number of epigrams, epitaphs, elegies, and "odes," including both the tributes to Shakespeare and several to royal and other patrons and friends, besides the *Execration upon Vulcan*, and the characteristic ode addressed, apparently in the earlier part of his career, by the poet to himself. To these pieces in verse should be added the *Discoveries*—an often highly interesting commonplace-book of aphorisms that occurred to the poet in his daily readings,—self-communings of a more tranquil and perhaps a more sober kind than the outpourings of the *Conversations at Hawthornden*.

The dramatic works of Ben Jonson fall into three or, if his fragmentary pastoral drama be considered to stand by itself, into four distinct divisions. His trage-

[1] With Inigo Jones, however, in quarrelling with whom, as Howell reminds Jonson, the poet was virtually quarrelling with his bread and butter, he seems to have found it impossible to live permanently at peace; his satirical *Expostulation* against the architect was published as late as 1635.

dies are only two in number—*Sejanus his Fall*, and *Catiline his Conspiracy*.[1] Of these the earlier, as is worth noting, was produced at Shakespeare's theatre, in all probability before the first of Shakespeare's Roman dramas, and still contains a considerable admixture of rhyme in the dialogue. Though perhaps less carefully elaborated in diction than its successor, *Sejanus* is at least equally impressive as a highly-wrought dramatic treatment of a complex historic theme. The character of Tiberius adds an element of curious psychological interest which is wanting in Catiline and his surroundings; but in both plays the action is powerfully conducted, and the care bestowed by the dramatist upon the great variety of characters introduced cannot, as in some of his comedies, be said to distract the interest of the reader. Both these tragedies are noble works, though the relative popularity of the subject has perhaps secured the preference to *Catiline*. Yet this play and its predecessor were alike too manifestly intended by their author to court the good-will of what he calls the "extraordinary" reader. It is difficult to imagine that (with the aid of judicious shortenings) either could altogether miss its effect on the stage; but, while Shakespeare causes us to forget, Jonson seems to wish us to remember, his authorities. The half is often greater than the whole; and Jonson, like all dramatists, and, it might be said, all novelists in similar cases, has had to pay the penalty incurred by too obvious a desire to underline the learning of the author.

Perversity—or would-be originality—alone could declare Jonson's tragedy preferable to his comedy. Even if the revolution which he created in the latter branch of the drama had been mistaken in its principles or unsatisfactory in its results, it would be clear that the strength of his dramatic genius lay in the power of depicting a great variety of characters, and that in comedy alone he succeeded in finding a wide field for the exercise of this power. There may have been no very original or very profound discovery in the idea which he illustrated in *Every Man in his Humor*, and, as it were, technically elaborated in *Every Man out of his Humor*,—that in many men one quality is observable which so possesses them as to draw the whole of their individualities one way, and that this phenomenon "may be truly said to be a humor." But by refusing to apply this term to a mere peculiarity or affection of manners, and restricting its use to actual or implied differences or distinctions of character, he broadened the whole basis of English comedy after his fashion, as Molière at a later date did that of French after his. It does not of course follow that Jonson's disciples, the Bromes and the Cartwrights, always adequately reproduced the master's conception of "humorous" comedy. Jonson's wide and various reading helped him to diversify the application of his theory, while perhaps at times it led him into too remote illustrations of it. Still, Captain Bobadil and Captain Tucca, Macilente and Fungoso, Volpone and Mosca, and a goodly number of other characters commend themselves readily as well as distinctly enough to the memory of those who have once made their acquaintance. It is a very futile criticism to condemn Jonson's characters as a mere series of types of general ideas: on the other hand, it is a very sound criticism to object, as Barry Cornwall does, to the "multitude of characters who throw no light upon the story, and lend no interest to it, occupying space that had better have been bestowed upon the principal agents of the plot."

In the construction of plots, as in most other respects, Jonson's at once conscientious and vigorous mind led him in the direction of originality; he depended to a far less degree than the greater part of his contemporaries (Shakespeare with the rest) upon borrowed plots. But either his inventive character was occasionally at fault in this respect, or his devotion (so to speak) to his characters often diverted his attention from a brisk conduct of his plot. The writer just quoted has directed attention to the essential likeness in the plot of two of Jonson's best comedies, *Volpone* and *The Alchemist*, and another critic, unsurpassed in his delicate appreciation of the relations between the drama and the stage,—Mr. W. Bodham Donne,—has dwelt on the difficulty which, in *The Poetaster* and elsewhere, Ben Jonson seems to experience in sustaining the *promise* of his actions. *The Poetaster* is, however, a play *sui generis*, in which the real business can hardly be said to begin till the last act.

Dryden, when criticising Ben Jonson's comedies in a superfine vein, which (to do him justice) he very rarely indulged, thought fit, while allowing the old master humor and incontestable "pleasantness," to deny him wit and those ornaments thereof which Quintilian reckons up under the terms *urbana*, *salsa*, *faceta*, and so forth. Such wit as Dryden has in view is the mere outward fashion or style of the day, the euphuism or "sheerwit" or *chic* which is the creed of the Fastidious Brisks and of their crafty purveyors at any given moment. In this Ben Jonson was no doubt defective; for he was too accurate an observer of men and manners to be himself a man of fashion, literary or otherwise. But it would be an error to suppose him, as a comic dramatist, to have stood towards the world around him in the attitude of a philosopher, careless of mere transient externalisms. It is said that the scene of his *Every Man in his Humor* was originally laid near Florence; and his *Volpone*, which is perhaps the darkest social picture ever drawn by him, plays at Venice. But the atmosphere of his comedies, wherever they may be supposed to play, is familiar enough to any one fairly acquainted with the native surroundings amidst which they were produced; and Ben Jonson's times live for us in his men and women, his country gulls and town gulls, his alchemists and exorcists, his "skeldring" captains and whining Puritans, and the whole ragamuffin rout of his *Bartholomew Fair*, the comedy *par excellence* of Elizabethan low life. After he had described the pastimes, fashionable and unfashionable, of his age, its feeble superstitions and its flaunting naughtinesses, its vaporing affectations and its lying effronteries, with an odor as of "divine tabacco" pervading the whole, little might seem to be left to describe for his "sons" and successors. Enough, however, remained; only that his followers speedily again threw manners and "humors" into one undistinguishable medley.

The gift which both in his art and in his life Jonson lacked was that of exercising the influence or creating the effects which he wished to exercise or create without the appearance of consciousness. Instead of this, influenced no doubt by the example of the free relations between author and public permitted by Attic comedy, he resorted again and again, from *Every Man out of his Humor* to *The Magnetic Lady*, to sundry devices of inductions and commentatory intermezzos and appendices, which, though occasionally effective by the excellence of their execution, are to be regretted as introducing into his dramas an exotic and often vexatious element. A man of letters to the very core, he never quite understood that there is and ought to be a wide difference between the world of letters and the world of the theatre.

The richness and versatility of Jonson's genius will never be fully appreciated by those who fail to acquaint themselves with what is preserved to us of his "masks" and cognate entertainments. He was conscious enough of his success in this direction—"next himself," he said, "only Fletcher and Chapman could write a mask." He introduced, or at least established, the ingenious innovation of the antimask, which Schlegel has described as a species of "parody added by the

[1] Of *The Fall of Mortimer* Jonson left only a few lines behind him; but, as he also left the argument of the play, factious ingenuity contrived to furbish up the relic into a libel against Queen Caroline and Sir Robert Walpole in 1731, and to revive the contrivance by way of an insult to the princess dowager of Wales and Lord Bute in 1762.

poet to his device, and usually prefixed to the serious entry," and which accordingly supplies a grotesque antidote to the often extravagantly imaginative main conception. Jonson's learning, creative power, and humorous ingenuity—combined, it should not be forgotton, with a genuine lyrical gift—all found abundant opportunities for displaying themselves in these productions. Though a growth of foreign origin, the mask was by him thoroughly domesticated in the high places of English literature. He lived long enough to see the species produce its poetic masterpiece in *Comus*, after which it soon faded away in times too fierce to allow of its further cultivation.

The Sad Shepherd, of which Jonson left behind him three acts and a prologue, is distinguished among English pastoral dramas by its freshness of tone; and, though not altogether without either allegorical allusions or classical ornament, breathes something of the spirit of the greenwood, and is not unnatural even in its supernatural element. While this piece, with its charming love-scenes between Robin Hood and Maid Marion, remains a fragment, another pastoral by Jonson, *The May Lord*, has been lost, and a third, of which Loch Lomond was intended to be the scene, probably remained unwritten.

Though Ben Jonson never altogether recognized the truth of the maxim that the dramatic art has properly speaking no didactic purpose, his long and laborious life was not wasted upon a barren endeavor. In tragedy he added two works of uncommon merit to our dramatic literature. In comedy his aim was higher, his effort more sustained, and his success more solid than were those of any of his fellows. In the subsidiary and hybrid species of the mask, he helped to open a new and attractive though undoubtedly devious path in the field of dramatic literature. His intellectual endowments surpassed those of most of our great dramatists in richness and in breadth; and in energy of application he probably surpassed them all. Yet it is less by these gifts or even by his power of hard work than by the true ring of his manliness that he is uniquely distinguished among his peers.

The date of the first folio volume of Jonson's *Works* (of which title his novel but characteristic use in applying it to plays was at the time much ridiculed) has already been mentioned as 1616; the second is described by Gifford as "a wretched continuation of the first, printed from MS. surreptitiously obtained during his life, or ignorantly hurried through the press after his death, and bearing a variety of dates from 1631 to 1641 inclusive." The whole works were reprinted in a single folio volume in 1692, and again in 6 vols. 8vo in 1715. Walley's edition in 7 vols., with a life, appeared in 1756, but was superseded in 1816 by Gifford's, in 9 vols, (of which the first includes a biographical memoir, and the famous essay on the "Proofs of Ben Jonson's Malignity, from the Commentators on Shakespeare"). A new edition of Gifford's excellent book was published in 9 vols. in 1875 by Colonel F. Cunningham, as well as a cheap reprint in 3 vols. in 1870. Both contain the "Conversations with Drummond," which were first printed in full by David Laing in the *Shakespeare Society's Publications* (1842), and the *Jonsonus Virbius*, a collection (unparalleled in number and variety of authors) of poetical tributes published about six months after Jonson's death by his friends and admirers. There is also a single-volume edition, with a very readable memoir, by Barry Cornwall (1838). Recently *Every Man in his Humor* has been edited, with an excellent brief biographical as well as special introduction, to which the present sketch owes some details, by H. B. Wheatley (1877). The criticisms of Jonson are too numerous to mention; but among many deserving to be overlooked should not be included that of Dryden in the preface to *An Evening's Love, or the Mock Astrologer*.

(A. W. W.)

JOPLIN, a flourishing city of Jasper county, Missouri, U. S., chiefly engaged in smelting lead and zinc, of which very large quantities are turned out annually. The population in 1900 was 26,023.

JOPPA, the Greek Ἰόππη, Ἰόπη, Hebrew JAPHO, and Arabic YÁFÁ, incorrectly written JAFFA, an ancient seaport of Palestine. It is mentioned in the lists of Thothmes III., and in an inscription of Sennacherib, but in the Bible probably in no writing older than the exile. After the exile it was the harbor of Judæa (Ezra iii. 7; Strabo, xvi. 2), and as such appears as an important point in the Maccabee wars, when it was fortified by Simon. Strabo and Josephus speak of it as a haunt of pirates, and on this account it was destroyed by Vespasian in the Jewish war. The small bay south of the town, called *Birket el Kamr* ("Moon-pool"), is possibly the old harbor, the present one being formed by a reef having a broad entrance on the northwest and a narrow passage in the middle. The coast being quite straight and unsheltered, the port possesses neither natural nor artificial advantages. In the 5th, 6th, and 11th centuries bishops of Joppa are noticed, under the metropolitan of Jerusalem. In 1187 Saladin took the town, which was recovered by King Richard in 1191, and retaken by Malek 'el Adil in 1196. In 1799 Napoleon stormed the city, then protected by walls. The fortifications were further increased at a later period by the English. The modern town, the seaport of Jerusalem, with which it is connected by a carriage road in very bad repair, is built on a rounded hillock rising 100 feet above the shore; to the north and south are sandhills; to the east are gardens of oranges, pomegranates, figs, and olives. Sweet water is derived from numerous wells, and palms and bananas occur in these orchards, which cover an area of 3 square miles. The walls of the town still remain standing; the houses are of stone, well built, and the bazaars are good. The town is the seat of a caim-macam or lieutenant-governor. It contains English, French, German, and American consulates, and Latin and Greek monasteries. The trade consists of wheat, sesame, oranges and other fruit, olives, and soap; the population is stated at 40,000, the majority being Moslems. A German colony established in 1868 has built two villages, one just outside the town on the northeast, the second (Sarôna) at a distance of 2 miles. The colonists number about 800.

Joppa is claimed to be the place where Andromeda was exposed. There her chains were shown (Jos., *B. J.*, iii. 9, 13), and thence the skelcton of the monster was brought to Rome by Scaurus (Pliny, ix. 4).

JORDAENS, JACOB (1593–1678), a painter, was born at Antwerp in 1593. He studied, like Rubens, under Adam van Noort, and his marriage with his master's daughter in 1616, the year after his admission to the guild of painters, prevented him from visiting Rome. He was forced to content himself with studying such examples of the Italian masters as he found at home; but a far more potent influence was exerted upon his style by Rubens, who employed him sometimes to reproduce small sketches in large. Jordaens is second to Rubens only in their special department of the Flemish school. In both there is the same warmth of color, truth to nature, mastery of chiaroscuro, and energy of expression; but Jordaens is wanting in dignity of conception, and is inferior in choice of forms, in the character of his heads, and in correctness of drawing. Not seldom he sins against good taste, and in some of his humorous pieces the coarseness is only atoned for by the animation. Of these last he seems in some cases to have painted several replicas. He employed his pencil also in Scriptural, mythological, historical, and allegorical subjects, and is well known as a portrait painter. He also etched some plates. He died at Antwerp in 1678.

JORDAN (יַרְדֵּן "swift-flowing"), the principal river of Palestine. The historical source of this famous stream is the cavé at Bániás (Cæsarea Philippi), while the stream from Dan (Tell el Kády) is called Lesser Jordan by Josephus, although the larger of the two springs at the Tell is probably the largest fountain in Syria. A third affluent, which has a better geographical claim to be considered the true Jordan, is the Nahr Hasbâny, rising near Hasbeiya on Her

mon. The stream from Bániás joins that from Tell el Kády after a course of 5 miles, descending by cascades through thickets and cane brakes, and a little lower down the Nahr Hasbány, after a course of 15 miles, joins the united stream from the other sources. The Bániás source is about 1000 feet above the Mediterranean, and, after passing through the papyrus swamps, the river reaches the Húleh Lake (Merom or Semechonitis), falling 1000 feet in 12 miles. The Húleh is 4 miles long, and thence to the Sea of Galilee is 10½ miles, with a fall of 682 feet. The second lake (see GALILEE) is 12½ miles long. The fall of the river after leaving it is at first 40 feet per mile, but on entering the plain of Beisán it becomes only 10 or 12 feet per mile, and further south only 4 or 5 feet. The total length from Bániás to the Dead Sea is 104 miles direct, and, as the level of the Dead Sea is 1292.5 below the Mediterranean, the total fall is nearly 2300 feet. Thus the Jordan is only half as long as the Thames, and the Sea of Galilee about equal in length to Windermere. The Ghór or valley of Jordan south of the Sea of Galilee varies in width from 4 to 14 miles east and west; the course of the river is extremely tortuous, and it is hidden by a dense jungle of cane, willow, and tamarisk, growing on the water's edge in the sunken channel called Zór, which is about a mile wide, with steep banks of white marl 50 to 100 feet high. For the last few miles the stream is free from jungle, flowing through a muddy flat. The average width is from 30 to 50 yards, but in February the river "overflows its banks" (Josh. iii. 15) and fills the Zór. The Arabs enumerate some forty fords, mostly passable in summer only. Of these the most important is *'Abárah* near Beisán,—probably the Bethabara of Origen, the *Onomastica*, and the common text of John i. 28, where Bethany is the true reading. There is a ferry immediately south of the Sea of Galilee, and another on the road from Shechem to Gilead; the latter is called Ed Dámieh, and has been conjectured to preserve the name of Adam (Josh. iii. 16) or Admah (Gen. x. 19). The ford of Ḥajlah, east of Jericho, is probably that of Josh. iii., and is the traditional site of Bethabara. The four main affluents of Jordan are the Hieromax (Yarmúk) and the Jabbok on the east, and on the west the Jálúd passing Beisán, and the Fári'a rising not far from Shechem. The supply of these and other perennial streams scarcely, however, balances the loss from evaporation of the river. Salt springs flow to Jordan along the greater part of its course south of Beisán. The valley, formed by a depression in the early Tertiary period, was once filled by a chain of lakes, and raised beaches have been found in various parts of the Ghór.

JORDAN, CAMILLE (1771–1821), French politician, was born in Lyons, January 11, 1771, of a well-to-do mercantile family. He was educated in Lyons, and from an early age was imbued with the royalist principles that distinguished his townsmen. He actively supported by voice, pen, and musket his native town in its gallant resistance to the Convention; and when Lyons fell, in October, 1793, Jordan fled. From Switzerland he passed in six months to England, where he formed acquaintances with other French exiles and with prominent British statesmen, and imbibed a lasting admiration for the English constitution. In 1796 he returned to France, and next year he was sent by Lyons as a deputy to the council of five hundred. There his eloquence won him consideration. He earnestly supported what he felt to be true freedom, especially in matters of religious worship, though the energetic appeal on behalf of church bells in his *Rapport sur la liberté des cultes* procured him the sobriquet of Jordan-Cloche. Jordan would have been one of the victims of the *coup d'état* of the 18th Fructidor (September 4, 1797,) had he not escaped to Basel. Thence he went to Germany, where he met Goethe, and probably laid the foundation of his affection for German literature, especially as represented by Klopstock. Back again in France by 1800, he boldly published in 1802 his *Vrai Sens du Vote National pour le Consulat à Vie*, in which he exposed the ambitious schemes of the First Consul. He was unmolested, however, and during the first empire lived in literary retirement at Lyons with his wife and family, producing for the Lyons Academy occasional papers on the *Influence réciproque de l'Éloquence sur la Révolution et de la Révolution sur l'Éloquence; Études sur Klopstock*, etc. At the Restoration in 1814 he again emerged into public life. By Louis XVIII. he was ennobled and named a councillor of state; and from 1816 he sat in the chamber of deputies as representative of Ain. At first he supported the ministry, but when they began to show signs of reaction he separated from them, and gradually came to be at the head of the constitutional opposition. His speeches in the chamber were always eloquent and powerful. Though warned by failing health to resign, Camille Jordan remained at his post till his death, May 19, 1821.

To his pen we owe *Lettre à M. Lamourette*, 1791; *Histoire de la Conversion d'une Dame Parisienne*, 1792; *La Loi et la Religion Vengées*, 1792; *Adresse à ses Commettants sur la Révolution du 4 Septembre*, 1797, 1797; *Sur les Troubles de Lyon*, 1818; *La Session de* 1817, 1818. His *Discours* were collected in 1818. The "Fragments Choisis," and translations from the German, were published in *L'Abeille française*.

Besides the various histories of the time, see for further details vol. x. of the *Revue Encyclopédique;* and a paper on Jordan and Madame de Staël, by Sainte-Beuve, in the *Revue des Deux Mondes* for March, 1868.

JORDANES, or JORNANDES, the historian of the Gothic nation, flourished about the middle of the 6th century of the Christian era.[1] All that we certainly know about his life is contained in three sentences of his history of the Goths (cap. 50), from which, among other particulars as to the history of his family, we learn that his grandfather Peria was notary to Candac, the chief of a confederation of Alans and other tribes settled during the latter half of the 5th century on the south of the Danube in the provinces which are now Bulgaria and the Dobrudscha. Jordanes himself was a notary until he renounced his worldly calling and took the vows of a monk. This, according to the manner of speaking of that day, is the meaning of his words "ante conversionem meam," though it is quite possible that he may at the same time have renounced the Arian creed of his forefathers, which it is clear that he no longer held when he wrote his Gothic history.

It is probable that the latter part at any rate of the life of Jordanes was spent in Italy. In some early editions of his works he is called "episcopus Ravennas," but the ample details which we possess as to the bishops of Ravenna make it certain that he never occupied that see. He may have been a bishop, but the best authority for that assertion (according to the statement in Muratori's *Rerum Italicarum Scriptores*, i. 189) is only Sigebert of Gembloux, who lived five centuries later. Traces have been discovered of a certain Jordanes, bishop of Crotona, in 551, and a "Jordanes defensor ecclesiæ nostræ" is mentioned in a letter of Pope Pelagius in 556.

We pass from the extremely shadowy personality of Jordanes to the more interesting question of his works.

1. The *De Regnorum et Temporum Successione*, or, as he himself called it, *Breviatio Chronicorum*, was probably composed in 550 or 551. It is a short and dry sketch of the history of the world from the creation, founded on the chronicles of Eusebius and Jerome. The book has no value, literary or historical, till the historian comes near to his own times; and here, from about 450 to 550, the *De Regnorum Suc-*

[1] The evidence of MSS. is overwhelming against the form Jornandes adopted in the two earliest editions. Strictly speaking, the MSS. favor Jordanis; but this seems to be only an incorrect spelling of Jordanes.

cessione is sometimes a really important authority owing to the extreme scarcity of other information as to this epoch.[1]

2. The other work of Jordanes, *De Rebus Geticis*, as it is commonly called, was styled by himself *De Origine Actuque Geticæ Gentis*, and was probably written in the year 552. He informs us that while he was engaged upon the *Breviatio* a friend named Castalius invited him to compress into one small treatise the twelve books—now lost—of the senator Cassiodorius, or Cassiodorus, on *The Origin and Actions of the Goths*. Jordanes professes to have had the work of Cassiodorius in his hands for but three days, and to reproduce the sense, not the words; but his book, short as it is, evidently contains long verbatim extracts from the earlier author, and it may be suspected that the story of the "triduana lectio" and the apology "quamvis verba non recolo," possibly even the friendly invitation of Castalius, are mere blinds to cover his own entire want of originality. This suspicion is strengthened by the fact (discovered by Von Sybel) that even the very preface to his book is taken almost word for word from Rufinus's translation of Origen's commentary on the epistle to the Romans. There is no doubt, even on Jordanes's own statements, that his work is based upon that of Cassiodorius, and that any historical worth which it possesses is due to that fact. Cassiodorius was one of the very few men who, Roman by birth and sympathies, could yet appreciate the greatness of the barbarians by whom the empire was overthrown. The chief adviser of Theodoric, the East Gothic king in Italy, he accepted with ardor that monarch's great scheme, if indeed he did not himself originally suggest it to his master, of welding Roman and Goth together into one harmonious state, which should preserve the social refinement and the intellectual culture of the Latin-speaking races, without losing the hardy virtues of their Teutonic conquerors. To this aim everything in the political life of Cassiodorius was subservient, and this aim he evidently kept before him in his Gothic history. He translated into his somewhat stilted prose the sagas which were still sung by the Gothic warriors round their camp-fires,[2] telling of the past migrations and dangers of their people. He reduced into form the pedigree which traced the descent of the Amals, Theodoric's kingly house, from gods and heroes. In all this he worked on such lines as a modern historical inquirer would have him work on. Unfortunately, he also accepted the current theory of his age which identified the Goths with the Scythians, whose country Darius Hystaspis invaded, and with the Getæ of Dacia whom Trajan conquered. This double identification enabled him to bring the favored race in line with the people of classical antiquity, to interweave with their history stories about Hercules and the Amazons, to make them invade Egypt, to claim for them a share in the wisdom of the semi-mythical Scythian philosopher Zamolxis. He was thus able with some show of plausibility to represent the Goths as "wiser than all the other barbarians and almost like the Greeks" (Jord., *De Reb. Get.*, cap. v.), and to send a son of the Gothic king Telephus to fight at the siege of Troy, on the right side, in rank with the ancestors of the Romans. All this we can now perceive to have no relation to history, but at the time it may have made the subjugation of the Roman less bitter to feel that he was not after all bowing down before a race of barbarian upstarts, but that his Amal sovereign was as firmly rooted in classical antiquity as any Julius or Claudius who ever wore the purple. A grateful king of the Goths, the young Athalaric, truly said of Cassiodorius, "Originem Gothicam historiam fecit esse Romanam, colligens quasi in unam coronam germen floridum, quod per librorum campos passim fuerat ante dispersum" (Cassiod., *Var.* ix. 25).

Cassiodorius completed his history of the Goths probably about the year 534. In the eighteen years which elapsed between that date and the composition of the *De Rebus Geticis* of Jordanes, great events, and most disastrous for the Romano-Gothic monarchy of Theodoric, had transpired. It was no longer possible to write as if the whole civilization of the Western world would sit down contentedly under the shadow of East Gothic dominion and Amal sovereignty. And moreover, the instincts of Jordanes, as churchman and Catholic, predisposed him to flatter the sacred majesty of Justinian, by whose victorious arms the overthrow of the barbarian kingdom in Italy had been effected. Hence we perceive two currents of tendency in the *De Rebus Geticis*. On the one hand, as a Goth himself and as a transcriber of the philo-Goth Cassiodorius, he magnifies the race of Alaric and Theodoric and claims for them their full share, perhaps more than their full share, of glory in the past. On the other hand, he speaks of the great anti-Teuton emperor Justinian, and of his reversal of the German conquests of the 5th century, in language which would certainly have grated on the ears of Totila and his heroes. Gelimer the Vandal is "overtaken by the revenge of Justinian," and Africa "long subject to the Vandal yoke is recalled into the liberty of the Roman kingdom." When Ravenna is taken, and Vitigis carried into captivity, Jordanes almost exults in the fact that "the nobility of the Amals and the illustrious offspring of so many mighty men have surrendered to a yet more illustrious prince and a yet mightier general, whose fame shall not grow dim through all the centuries."

This laudation, both of the Goths and of their Byzantine conquerors may perhaps help us to understand the political motive with which the *De Rebus Geticis* was written. In the year 551 Germanus, nephew of Justinian, accompanied by his bride, Matasuntha, granddaughter of Theodoric, set forth to reconquer Italy for the empire. His early death (in 552) prevented any schemes for a revived Romano-Gothic kingdom which may have been based on his personality. His widow, however, bore a posthumous child, also named Germanus, of whom Jordanes speaks (cap. 60) as "blending the blood of the Anicii and the Amals, and furnishing a hope under the divine blessing of one day uniting their glories." This younger Germanus did nothing in after life to realize these anticipations; but the somewhat pointed way in which his name and his mother's name are mentioned by Jordanes lends some probability to the idea that the *De Rebus Geticis* was put forth in the interests of a third party, Italian rather than Gothic or Byzantine, and possibly headed by Pope Vigilius, who may have wished to advocate the claims of this infant to an independent sovereignty in Italy.

The *De Rebus Geticis* falls naturally into four parts. The first (chaps. i.–xiii.) commences with a geographical description of the three quarters of the world, and in more detail of Britain and "Scanzia" (Sweden), from which the Goths under their king Berig migrated to the southern coast of the Baltic. Their migration across what has since been called Lithuania, to the shores of the Euxine, and their differentiation into Visigoths and Ostrogoths, follow. Chaps. v.–xiii. contain an account of the intrusive Geto-Scythian element before alluded to.

The second section (chaps. xiv.–xxiv.) returns to the true history of the Gothic nation, sets forth the genealogy of the Amal kings, and describes the inroads of the Goths into the Roman empire in the 3d century, with the foundation and the overthrow of the great but somewhat shadowy kingdom of Hermanric. The author here probably rests to some extent on Orosius, Ammianus, and other Latin historians, but draws partially at least from native sources.

The third section (chaps. xxv.–xlvii.) traces the history of the West Goths from the Hunnish invasion to the downfall of the Gothic kingdom in Gaul under Alaric II. (376 to 507 A.D.). The best part of this section, and indeed of

[1] The terms of the dedication of this book to a certain Vigilius make it impossible that the pope of that name is meant.

[2] "Quemadmodum et in priscis eorum carminibus pæne historico ritu in commune recolitur," *De Reb. Get*, iv.

the whole book, is the seven chapters devoted to Attila's invasion of Gaul and the battle of the Mauriac plains. Here we have in all probability a verbatim extract from Cassiodorius, who has interwoven with his narrative large portions of the Gothic sagas. The celebrated expression "certaminis gaudia" assuredly came at first neither from the suave minister Cassiodorius nor from the small-souled notary Jordanes, but is the translation of some thought which first found utterance through the lips of a Gothic minstrel.

The fourth section (chaps. xlviii.–ix.) traces the history of the East Goths from the same Hunnish invasion to the first overthrow of the Gothic monarchy in Italy (376–539). In this fourth section are inserted, somewhat out of their proper place, some valuable details as to the *Gothi Minores*, "an immense people dwelling in the region of Nicopolis, with their high priest and primate Vulfilas, who is said also to have taught them letters." The book closes with the allusion to Germanus and the panegyric on Justinian as the conqueror of the Goths referred to above.

As to the style and literary character of Jordanes, every author who has used him speaks in terms of severe censure. When he is left to himself and not merely transcribing, he is sometimes scarcely grammatical. There are awkward gaps in his narrative and statements inconsistent with each other. He quotes, as if he were familiarly acquainted with their writings, about twenty Greek and Roman writers, of whom it is almost certain that he had not read more than three or four. At the same time he does not quote the chronicler Marcellinus, from whom he has copied verbatim the history of the deposition of Augustulus. All these faults make him a peculiarly unsatisfactory authority to depend upon where we cannot check his statements by those of other authors. It may, however, be pleaded in extenuation that he is professedly a transcriber, and, if his story be correct, a transcriber under peculiarly unfavorable circumstances. He has also himself suffered much from the inaccuracy of copyists. But nothing has really been more unfortunate for the reputation of Jordanes as a writer than the extreme preciousness of the information which he has preserved to us. The Teutonic tribes whose dim original he records have in the course of centuries attained to world-wide dominion. The battle in the Mauriac plains, of which he is really the solo historian, is now seen to have had at least as important bearings on the destinies of the world as Marathon or Waterloo. And thus the hasty pamphlet of a half-educated Gothic monk has been forced into prominence, almost into rivalry with the finished productions of the great writers of classical antiquity. No wonder that it stands the comparison badly; but with all its faults the *De Rebus Geticis* of Jordanes will probably ever retain its place side by side with the *De Moribus Germanorum* of Tacitus, as a chief source of information respecting the history, institutions, and modes of thought of our Teutonic forefathers.

Manuscripts.—The chief MSS. of the *De Rebus Geticis* are one at Heidelberg of the 8th century and one at the Vatican of the 10th, one at Milan, two of the 11th and 12th centuries at Vienna, and one of the 12th century at Munich. Unfortunately the Heidelberg and Vienna MSS. perished in the fire at Prof. Mommsen's house, but not before he had accurately collated them.

Editions.—The *editio princeps* of the *De Rebus Geticis* was published by Peutinger, at Augsburg, 1515. Two of the best known editions are those in Muratori's *Rerum Italicarum Scriptores*, vol. i. (which gives Garet's text collected by J. A. Saxe with the Ambrosian MS., and which also contains the *De Regnorum Successione*), and in Grotius's *Historia Gothorum, Vandalorum, et Langobardorum*, Amsterdam, 1655. A new edition is expected from Professor Mommsen.

Literature.—The foregoing article is chiefly founded on Von Sybel's essay, *De fontibus Jordanis* (1838), Schirren's *De ratione quæ inter Jordanem et Cassiodorum intercedat Commentatio*, Dorpat, 1858; Kopke's *Die Anfänge des Königthums bei den Gothen*, Berlin, 1859; Dahn's *Die Könige der Germanen*, vol. ii., Munich, 1861; Ebert's *Geschichte der Christlich-Lateinischen Literatur*, Leipsic, 1874; and Wattenbach's *Deutschland's Geschichtsquellen im Mittelalter*. Berlin, 1877. (T. H.)

JORTIN, John (1698–1770), a writer on theological subjects, was the son of a Protestant refugee from Brittany, and was born in London, 23d October, 1698. In his tenth year he entered Charterhouse school, and in 1715 he became a pensioner of Jesus College, Cambridge, where his reputation as a Greek scholar led the classical tutor of his college to select him to translate certain passages from Eustathius for the use of Pope in his translation of Homer. He graduated B.A. in 1719 and M.A. in 1722. In the latter year he published a small volume of Latin verse entitled *Lusus Poetici*. Having received priest's orders in 1724, he was in 1726 presented by his college to the vicarage of Swavesey in Cambridgeshire, an appointment which he resigned in 1730 to become preacher of a chapel in New Street, London. In 1731, along with some friends, he began a publication entitled *Miscellaneous Observations on Authors Ancient and Modern*, which appeared at intervals during two years. In 1737 he was presented to the vicarage of Eastwell in Kent, and in 1751 he became rector of St. Dunstan's-in-the-East. Shortly after becoming chaplain to the bishop of London in 1762, he was appointed to a prebendal stall of St. Paul's, and to the vicarage of Kensington, and in 1764 he was made archdeacon of London. He died at Kensington, September 5, 1770. The principal works of Jortin are *Discussions Concerning the Truth of the Christian Religion*, 1746; *Remarks on Ecclesiastical History*, 1751; *Life of Erasmus*, 2 vols., 1750, 1760, founded on the life by Le Clerc, but containing a large amount of new matter; and *Tracts Philological, Critical, and Miscellaneous*, 1790. All his works display great learning and some acuteness both of research and criticism, but though written in a lively style they do not bear that stamp of originality which confers permanent interest.

See Disney's *Life of Jortin*, 1792; and the "Account of his Life and Writings" prefixed to an edition of the *Remarks on Ecclesiastical History* published in 1816.

JOSEPH, the most powerful tribe of northern Israel, occupied the centre of the land from the plain of Esdraelon to the mountain country of Benjamin and threw out colonies to Bashan and northern Gilead (see Israel, p. 397). Unlike the other sons of Jacob, Joseph is usually reckoned as two tribes, the younger but more numerous tribe of Ephraim, to which Joshua belonged, having the pre-eminence over the other—Manasseh. In Ephraim lay the city of Shechem, with the tomb of the tribal ancestor, and the great sanctuary of Shiloh where the ark stood till the battle of Ebenezer destroyed for a time the hegemony of Joseph, till after the division of the kingdoms he again became "the crowned one of his brethren" (Gen. xlix. 26; Deut. xxxiii. 16). Along with the small tribe of Benjamin, which as its name indicates lay immediately to the south, the house of Joseph constituted the group known as sons of Rachel (the ewe), which with the sons of Leah (the antelope) claimed a higher ancestry than the other Hebrews (the sons of Jacob's concubines).

The name of Joseph, the tribal ancestor, is explained in Gen. xxx. 24, in accordance with the usual spelling יֹסֵף, as meaning "he addeth" (hence in Ps. lxxxi. 6 [E. V. 5] the resolved form יְהוֹסֵף). Another hand in Gen. xxx. 23 takes the word from אָסַף, "he taketh away." The history of Joseph, Gen. xxxvii.–l., belongs almost wholly to the earliest strata of the Pentateuch, the narratives of the Jehovist and non-Levitical Elohist, the larger share belonging to the latter author, himself probably a member of the house of Joseph.

The history of Joseph in Egypt displays remarkable familiarity with the circumstances and usages of that country (see Ebers, *Aegypten und die Bücher Mosis*, Leipsic, 1868), but presents no data which enable us with certainty to combine the Biblical record with known events in Egyptian history. It is still disputed whether Joseph came to Egypt before, under, or after the Hyksos. The first opinion, which is supported by Bunsen and others, involves a considerable reduction in the period of five hundred and eleven years assigned to the Hyksos by Manetho, while on the other hand a date subsequent to the expulsion of the Semitic invaders (*e. g.*, under Sethi I. as Lepsius suggests) demands a great shortening of the four hundred and thirty years of Exod. xii. 40, if the Pharaoh of the oppression was Sethi's successor, Rameses II. That the Israelites entered Egypt under the Hyksos is already mentioned as the current opinion of his time by George Syncellus, and is followed by many moderns, who observe that the promotion of a Hebrew appears most natural under a Semitic dynasty. See Egypt, vol. vii. p. 637, and for Brugsch's supposed monumental reference to the seven years' famine, *ibid.*, p. 634. The Egyptian tale of "The Two Brothers," which presents a remarkable parallel to the story of Joseph, is given in *Records of the Past*, vol. ii.

The name of Joseph was common among the later Jews; of the Biblical personages by whom it was borne the best known are Joseph the husband of Mary, Joseph of Arimathæa, Joseph Barnabas, and Joseph Barsabas.

JOSEPH, the husband of Mary the mother of Jesus, was a descendant of the house of David, and followed the trade of a carpenter in the village of Nazareth. Of his personal history practically nothing is recorded in Scripture. It is probable that he had died before the beginning of the public ministry of Christ: at least this seems a fair inference from the fact that no mention of him is made in passages relating to this period where the mother and brethren of Jesus are introduced. From John xix. 26 it is clear that he was not alive at the time of the crucifixion. Ecclesiastical tradition, probably influenced by dogmatic prepossessions, has it that when married to Mary he was already eighty years of age and the father of four sons and two daughters, and that his first wife was named Salome, a connection of the family of John the Baptist. In the Roman Catholic Church the 19th of March has since 1642 been a feast of obligation in his honor. His cultus is on the increase.

JOSEPH I. (1678–1711), Holy Roman emperor, was born in Vienna, July 26, 1678. In 1689 he received the crown of Hungary, in 1690 that of the king of the Romans; and in 1705 he succeeded his father, Leopold I., as Holy Roman emperor. The war of the Spanish succession was raging at the time of his accession to the imperial throne; and it continued during the whole of his reign. Thanks to the genius of Marlborough and Eugene, Joseph was able to maintain in this struggle the greatest military traditions of the empire; and, the French troops having been gradually driven out of Italy and the Netherlands, Louis XIV. was compelled to ask several times for the conclusion of peace. The pope also gave evidence of the emperor's power by recognizing his brother Charles as king of Spain. In 1706 the electors of Cologne and Bavaria, and in 1708 the Duke of Mantua, were put to the ban of the empire for supporting the enemy of their sovereign; and the emperor not only seized Bavaria, but began to partition it. He was successful, too, in Hungary, where he put down a rebellion that had broken out in the time of his father. On the other hand, he found it prudent to manifest a conciliatory spirit in his relations to Charles XII. of Sweden, who in 1706 made his way from Poland to Saxony through Silesia. In 1707 the emperor concluded treaties with him, granting religious liberty to the Silesian Protestants, and restoring to them upwards of two hundred churches which had been seized by the Jesuits. These concessions were not unwillingly made by the emperor, who, although a sincere Catholic, was of a tolerant disposition. He showed his respect for the constitution and dignity of the empire by supporting the diet in the free exercise of its functions, by promoting the activity of the imperial chamber, and by restoring Donauwörth, which had been mediatized by Bavaria, to the position of a free imperial city. He died of small-pox, on the 17th of April, 1711.

JOSEPH II. (1741–1790), Holy Roman emperor, born in Vienna, March 13, 1741, was the son of the emperor Francis I. and Maria Theresa. He was made king of the Romans in 1764; and in 1765 he succeeded his father as Holy Roman emperor. Maria Theresa declared him coregent of her hereditary states, but almost all real power she retained in her own hands. He received full authority only in the regulation of the military system, into which he introduced many changes, following in the main the example of Frederick the Great. Chiefly by his advice Maria Theresa was induced to associate herself with Russia and Prussia in the partition of Poland; and in 1777 he persuaded her to force Turkey to surrender Bukowina. When the younger branch of the house of Wittelsbach died out in 1777, Joseph claimed a large part of its territory; but Frederick the Great resisted his pretensions and in 1779, after a nominal war, the emperor accepted the treaty of Teschen, by which he obtained only a small concession. Before this time he had sought to prepare himself for his future duties by extensive travels in his own states and in foreign countries; and everywhere he had made a favorable impression by his genial courtesy. In 1769 he had visited Frederick the Great, for whom he had at that time a warm admiration; and in the following year Frederick returned the visit, going back to Prussia with the conviction that it would be necessary "to keep his eye on that young man." On the death of Maria Theresa, in 1780, Joseph became sole ruler of the Austrian states. He was penetrated by the characteristic ideas of the 18th century as to the duties of an absolute monarch, and began at once to give effect to them in a fearless and almost revolutionary spirit. His first step was to combine the various nationalities subject to him into a single state with thirteen administrative districts. He refused to be crowned king of Hungary, and would not summon the Hungarian diet, insisting that the country should be governed as a province, and causing German to be used as the official language. Among other reforms he proclaimed the abolition of serfdom, substituted various punishments for the capital penalty, established common tribunals, and issued new codes based on the principle that all citizens are equal before the law. He transferred the censorship of books from the clergy to laymen of liberal sympathies, and granted complete freedom to journalism. He instituted public libraries and observatories, founded a medical college in Vienna, a university in Lemberg, and schools for the middle classes in various parts of the monarchy, and encouraged art by offering prizes in connection with the academy of the plastic arts. Industry and trade he fostered by destroying many monopolies, by aiding in the establishment of new manufactures, by raising Fiume to the position of a free harbor, and by opening the Danube to his subjects from its source to the Black Sea. His ecclesiastical policy was of so bold a character that Pope Pius VI. went to Vienna for the purpose of expostulating with him, but found that the emperor was beyond the range of his influence. The hierarchy was forbidden to correspond with the Roman see without express permission; and papal bulls were subjected to the *Placetum Regium*. In 1781 he issued an edict of toleration, granting freedom of worship to all Protestants and to members of the Greek Church; and between 1782 and 1790 about seven hundred monasteries were closed, the members of religious orders being reduced from 63,000 to 27,000. All these changes were well meant, but the emperor, in the ardor of his philanthropy, shot too far ahead of the prevailing sentiment of his people. Moreover, his good intentions were often rendered fruitless by unskilful or unsympathetic subordinates. In nearly every part of the monarchy discontent soon manifested itself, and some of the inhabitants of Tyrol broke into open rebellion. The Hungarians bitterly resented the suppression of their ancient privileges, and in 1787 the emperor's new institutions led in several districts to a furious conflict between the peasantry and the nobles. The estates of the Austrian Netherlands persistently opposed the execution of his schemes, the clergy being especially active in stirring up popular indignation; and when, in 1789, he altogether destroyed their constitution, they rebelled and were able for some months to maintain their independence. In Hungary there was so dangerous an agitation that in January, 1790, Joseph had to undo almost everything he had attempted to accomplish in that country during the previous nine years; he succeeded only in maintaining the decrees by which he had abolished serfdom and established toleration. Thus his last days were rendered miserable by the conviction that his career had been a failure. He was not more fortunate in his foreign policy than in his home government. Early in his

reign, indeed, he gained some advantages over the Dutch, who were obliged to abandon their fortresses on the frontier of the Austrian Netherlands. And when they refused to open the Scheldt, they had to compensate him (in 1785) by a payment of ten million florins. In the same year he renewed his claims on Bavarian territory, but was thwarted by Frederick the Great, who formed his famous league of princes for the protection of the German states against Austrian ambition. After the conclusion of the treaty of Teschen, Joseph made it one of the chief objects of his foreign policy to form an enduring alliance between Austria and Russia; and in 1788, in association with Catherine II., he declared war against Turkey. He did not live to see the end of this war, which brought him little honor. On the 20th of February, 1790, he died, deeply disappointed that he had been able to achieve so few of the objects with which he had begun his reign. He was twice married, first to the Princess Marie Louise of Parma, afterwards to the princess Marie Josephe of Bavaria. His only daughter died in childhood, so that he was succeeded by his brother Leopold II. Notwithstanding the defeat of so many of his plans, his reign marked an epoch in the history of Austria; and the interest still excited by his name was shown by the enthusiasm with which the people of Austria celebrated in 1880 the centenary of his accession as sole ruler. On the pedestal of his statue in Vienna, erected by Francis I., in 1807, are these words:—"Josepho secundo, qui saluti publicæ vixit non diu, sed totus."

(J. SI.)

JOSÉPHINE (1763–1814), empress of the French, was born at Trois-Ilets, Martinique, on the 23d of June, 1763, and was the eldest of three daughters born to Joseph Tascher de la Pagerie, lieutenant in the artillery, and his wife Rose-Claire Des Vergers de Sannois. She was educated at a local convent, from which she was withdrawn in her fifteenth year, knowing how to dance, sing, and embroider, but little else. An aunt, resident in France, was godmother to the second son of the Marquis de Beauharnais, once the governor of Martinique; and she suggested a marriage between her god-child and niece. After much negotiation between the families, in which the second and youngest daughters were both preferred to Joséphine, her father carried her to Havre in 1779, she being already described to her aunt and the Beauharnais as possessing a fine complexion, beautiful arms and eyes, and with a sweet voice and a remarkable taste for music—altogether "très-avancée et formée pour son âge." On the 13th of December she was married to the Vicomte Alexandre Beauharnais at Noisy-le-Grand. Her son Eugène was born at a time when her relations with her husband were embittered by jealousy; and after the birth of her daughter Hortense-Eugénie he sought a separation, but, though he carried his request to the parliament, his petition was dismissed. Joséphine went back to her parents in June, 1788, and was with them when the Revolution broke out. At the request of the vicomte she returned, however, to France in 1790. He was then a member of the constituent assembly, receiving at his house the chiefs of the constitutional party; and Joséphine was admired by all of them for her dignity, simplicity, and sweetness. As the crisis became more acute, her husband thought it prudent to withdraw to Ferté-Beauharnais, in Sologne, where he left his family when he went to command the army of the Rhine. After his execution by order of the Convention, Joséphine was reduced to great straits, and not till the end of 1795 did regular remittances from Martinique begin again. She was living in the Rue Chautereine, Paris, in a house of her own, when she paid her first visit to Napoleon, to thank him for restoring the sword of her husband. She was in the full flower of her womanhood; Napoleon was at once drawn to her; on the 9th of March, 1796, they were married. In twelve days he left her to take command of the army in Italy; but in June, at his earnest request, she joined him at Milan and went on to Brescia. After the peace of Léoben they lived at Montebello near Milan, and Joséphine was for some time the queen of a court frequented by great officers and diplomatists. Having visited Rome, she went back to Paris, and at her house assembled the most distinguished men of the day. During the expedition to Egypt she moved between the capital and Plombières; but she had her first quarrel with Napoleon on his return, because, by an oversight, she omitted meeting him. Social duties of the most brilliant and difficult sort began to accumulate round her during the consulate. At the palace of the Luxembourg and the Tuileries her drawing-room was again the centre of attraction in Paris; her receptions were ruled by the old traditions of regal ceremony, and there was an endless round of fêtes, entertainments, and plays. Her beauty and amiability won upon everybody; and when she wanted rest she retired to Malmaison, a country seat she had bought, and amused herself with a variety of light studies in botany and natural history. Rumors now began to reach her that Napoleon, in despair of offspring, meant to sue for a divorce. She had long known that his relatives were trying to undermine her position; and even when she knelt beside him at Notre Dame, and received the triple unction at the ceremony which crowned her empress, she knew it to be a concession wrung from him. After the coronation he gave her less and less of his society. It was not, however, until the winter of 1809 that he deliberately proposed to dissolve the connection. He divorced her with much show of tenderness, and she retired to Malmaison with an annual grant of two million francs for her establishment. Her affection for Napoleon, and her anxiety for his success, remained strong to the hour of her death, on May 24, 1814; and but for his inordinate ambition he would never have sought to live apart from her. She often provoked him by a certain mild duplicity in her character; she was extravagant and superstitious; yet, to fulfil the high destiny to which she was called, she brought much gentleness, courage, and sweetness, qualities which carried her through her reverses with admirable dignity.

See Aubenas, *Histoire de l'Impératrice Joséphine*, 1858–59.

JOSEPHUS, FLAVIUS, the well-known historian of the Jews, was born at Jerusalem in the first year of the reign of Caligula; the precise date is uncertain, but it lies somewhere between September 13, 37, and March 16, 38 A.D. His early advantages were very considerable. His father Matthias belonged to one of the best priestly families in the city, while on his mother's side he was descended from Jonathan, the first Hasmonean high priest. The position of his parents procured for him a careful education, and such was his progress (at least if his own account of himself is to be believed) that at the age of fourteen he was often consulted by the high priests and prominent citizens on difficult points of Jewish law. At sixteen he resolved upon an experimental study of the doctrines of the three leading sects, or schools of philosophy, as he prefers to consider them; and, hearing that Banus, a celebrated Essene, was living in the wilderness with the rigorous asceticism of a hermit, he joined him and remained under his teaching for three years. Returning to Jerusalem at the age of nineteen, he definitively joined the Pharisees, to whom he continued ever after to adhere. In 64 A.D. (æt. 26) he undertook a journey to Rome to intercede for some priests of his acquaintance whom Felix the procurator had sent thither as prisoners to be tried on some trifling charges. Landing safely at Puteoli after a narrow escape from death by shipwreck in the Adriatic, he gained the friendship of Alityrus, a famous Jewish mime of the day, and a favorite of Nero; by this means he not only obtained the pardon of his friends, but was also loaded with many valuable gifts by the empress Poppæa. On reaching Judæa again he found his countrymen bent at all hazards

on throwing off the Roman yoke; knowing well the resources of Rome, and the hopelessness of successfully resisting her power, he (according to his own account, which is not in itself very improbable) did his best to dissuade them from any such attempt. Ultimately, however, after the victory over Cestius Gallus, he yielded to the force of the current, and joined the revolutionary movement in 66, being entrusted with the task of governing and defending the province of Galilee, an appointment for which he was indebted to family influence rather than to any known military skill. Proceeding at once to his province, he set about the execution of plans of political reorganization, at the same time fortifying various military positions, and getting together and drilling an army of 100,000 men. Very soon, however, he had to encounter the opposition of a strong party, headed by John of Giscala, and it was with difficulty that he averted an insurrection at Taricheæ, and afterwards saved himself by flight from Tiberias. His enemies actually at one time had succeeded in obtaining his recall; but the act was afterwards cancelled, through the powerful influence he still possessed in Jerusalem. Meanwhile Vespasian had assembled a large force at Antioch, and in the spring of 67 threw a garrison into Sepphoris, whence (the troops of Josephus not waiting his attack) he made himself master of all Lower Galilee. Josephus himself, falling back on Tiberias, sent for large reinforcements from Jerusalem; these not being forthcoming, he in May shut himself up in Jotopata, the defence of which he maintained against all the efforts of the Romans for forty-seven days. At the end of that period the place was taken by storm, and such of the garrison as had not perished in the siege were put to death by the conquerors. The governor himself demanded to be led into the presence of the general, and, with great adroitness assuming the rôle of a prophet, told his captor that he was no chance prisoner, but had been commissioned by heaven to predict that he was shortly to become the sole head of the Roman empire. The plan was so far successful that the prisoner's life was spared; Vespasian, however, kept him in close confinement for two years, but on attaining the purple liberated him. Thenceforward Josephus assumed the family name of his patron (Flavius). After having accompanied Vespasian to Alexandria, he attended Titus to Palestine, and remained in his train until the close of the war. At the risk of his life he was more than once sent to urge his countrymen to yield, but without success. After the fall of the city he accompanied Titus to Rome, where Vespasian assigned him a residence in what had once been his own house, conferred on him the citizenship, and gave him a yearly pension, to which was afterwards added an estate in Judæa. Under Titus and Domitian he was confirmed in all his privileges, devoting the peaceful remainder of his days to those literary labors with which his name is now so exclusively associated. The precise date of his death is unknown; he must have survived the first century, for his autobiography mentions the death of Agrippa II., which occurred in 100 A.D.

His extant works are the following. (1) *History of the Jewish War* (Περὶ τοῦ Ἰουδαϊκοῦ πολέμου), in seven books. It was originally written in Aramaic for the benefit of the Jews dwelling beyond the Euphrates, but was afterwards translated by its author into the Greek, which alone we now possess. Books i.–ii. 14 sketch the whole course of Jewish history from the period of the Maccabees to the beginning of the war. The remainder of the work gives a minute account of the entire struggle from 66 to its complete suppression in 73 A.D. On its completion the whole work was submitted to Vespasian, Titus, and Agrippa II., who, the author tells us, bore witness to its accuracy. Of its general trustworthiness there can be no reasonable doubt: Josephus had a considerable personal share in much of what he records; and on other points he seems to have had access to direct documentary evidence. The speeches which he reports are not of course to be construed by stricter rules than those which occur in the works of Livy or Thucydides; and apart from this some allowance also must be made for a tendency to exaggeration or false accentuation wherever his vanity judged such a thing to be desirable. (2) *Antiquities of the Jews* (Ἰουδαϊκὴ ἀρχαιολογία), in twenty books, a comprehensive Jewish history from the earliest times down to the outbreak of the war in 66. It was completed in the thirteenth year of Domitian (93–94 A.D.), long after the author's own interest in it had exhausted itself. For the first eleven books, covered by the Scripture narrative, his exclusive authority seems to have been the Bible itself, especially the LXX. translation. He frequently, however, omits or modifies points which seemed to him likely to give offence; sometimes he supplements with current traditions or uses the works of his predecessors in the same field, Demetrius and Artapanus; and occasionally he gives excerpts from profane writers. The remaining nine books are very unequal in merit. The period between Alexander the Great and the Maccabees is almost an entire blank. For the Maccabean wars (xii. 5–xiii. 7) he had 1 Macc. to draw upon; for the reigns of the later Hasmoneans (xiii. 8–xiv.) he is dependent upon the historians Strabo and Nicolaus of Damascus. The last-named writer is also his chief authority for the portion of his narrative which relates to the times of Herod (xiv.–xvii.), but he appears to have had access to some original memoirs. The last three books (xviii–xx.), relating to the times immediately subsequent to the death of Herod, are more meagre than might have been expected, and by the carelessness of their manner bear witness to the author's confessed fatigue. Book xviii. (chap. iii. sec. 3) contains a remarkable passage relating to Jesus Christ, which is twice cited by Eusebius as genuine (*H. E.*, i. 11; *Dem. Ev.*, iii. 3, 105–6), and which is met with in all the extant MSS. It is, however, unanimously believed to be, in its present form at least, spurious, and those who contend even for its partial genuineness are decidedly in the minority. (3) *Autobiography*, in seventy-six chapters, all of which, however, except the first six and the last two relate to the occurrences in Galilee in which he had so large a share during 66–67 A.D., written in defence of himself against the representations of a certain Justus of Tiberias. His narrative of these events cannot be regarded as an impartial one, and that in some points at least he was led to sacrifice truth to self-interest can be conclusively shown by comparison even with his own earlier work, the *History of the Jewish War*. The *Vita*, which contains the allusion to the death of Agrippa II., must have been written at a date subsequent to 100 A.D. (4) *Against Apion*, in two books. This is the usual but somewhat misleading title of a general apology for Judaism in which the polemic against Apion occupies only a subordinate place. Porphyry cites it by the title Πρὸς τοὺς Ἕλληνας, while Origen and Eusebius call it Περὶ τῆς τῶν Ἰουδαίων ἀρχαιότητος. The date of its composition is later than that of the *Antiquities*. Other works referred to by Josephus, but no longer extant, are (1) Περὶ τῶν νόμων (*Ant.*, iii. 5, 6), which is most probably to be identified with the composition elsewhere cited by the title Περὶ ἓθῶν καὶ αἰτιῶν (*Ant.*, iv. 8, 4); and (2) Περὶ θεοῦ καὶ τῆς οὐσίας αὐτοῦ, in four books (*Ant.*, xx. 11, 2). The so-called fourth book of Maccabees has sometimes, but erroneously, been assigned to Josephus. One or two philosophical treatises are also attributed to him by Photius; they are, however, obviously of Christian origin, and most probably are from the pen of Hippolytus of Ostia.

The Greek text of the works of Josephus was first printed at Basel in 1544. The earliest critical editions were those of Hudson (Oxford, 1720) and Havercamp (Utrecht, 1726); the text of the latter is that given by Oberthür (3 vols. 8vo., Leipsic, 1782–85) and by Richter (Leipsic, 1826–27). Further emendations occur in the edition of Dindorf (Paris, 1845–47), which is the Basis of Bekker's edition (Leipsic, 1855–56). A new edition based upon fresh collation of MSS. is promised by Niese. The treatise *Against Apion* was separately edited, with notes, by J. G. Müller, 1877. The translations of Josephus have been very numerous, and his writings are also the basis of the *Bellum Judaicum* which bears the name of Egesippus (corrupted from Josippus), and of the mediæval Hebrew history ascribed to Josippon ben Gorion. For the whole subject, biographical and literary, see Schürer's *NTliche Zeitgeschichte* (1874) and his exhaustive article "Josephus" in Herzog-Plitt's *Real-Encycl.*, vol. vii. (1880).

JOSHUA (יְהוֹשֻׁעַ, or in later Heb. יֵשׁוּעַ, Gr. Ἰησοῦς, whence "Jesus" in the A. V. of Heb. iv. 8; another form of the name is Hoshea, Num. xiii. 8, 16), first the lieutenant and afterwards the successor of Moses, was the son of Nun, of the tribe of Ephraim, and left Egypt, along with the rest of the children of Israel,

at the time of the exodus. In the Pentateuch he is first mentioned as being the victorious commander of the Israelites in their battle against the Amalekites at Rephidim (Ex. xvii. 9–13), and he is represented as having earned further distinction along with Caleb by his calm and courageous demeanor in the midst of the popular tumult caused by the report of the spies (Num. xiv. 6–9, 38). On the death of Moses he assumed the leadership to which he had previously been designated by his chief, and the book known by his name is entirely occupied with details of the manner in which he carried out the task thus laid to his hand, —that of taking possession of the land of Canaan. On the completion of the reconnaissance by the two spies, he left Shittim with his army, preceded by the priest-borne ark of the covenant. The Jordan having been miraculously crossed, his first encampment was at Gilgal. Jericho and Ai soon fell into his hands, and the people of Gibeon became vassals. In the neighborhood of Gibeon the five kings of the Amorites were crushed in a decisive battle in which the very elements conspired to favor the invader, and (to use the poetical language of the book of Jashar) "the sun stood still and the moon stayed until the people had avenged themselves upon their enemies." The victorious arms of Israel were now directed northwards against a league of Canaanite potentates under the hegemony of Jabin, king of Hazor; anticipating the attack of the enemy, Joshua surprised and crushed them at the waters of Merom, Hazor itself being taken and burnt. Thus far the first twelve chapters of the book of Joshua; the remaining twelve describe the partition of the (conquered and unconquered) country among the twelve tribes, and conclude with a résumé of his parting exhortations. At the age of one hundred and ten he died and was buried in his inheritance in Timnath-serah, in the territory of Ephraim. For the book of Joshua, an integral part of that part of the Old Testament sometimes spoken of as Hexateuch, the reader is referred to the heading PENTATEUCH.

Critical investigation has shown that the history of Joshua as now sketched is a composite narrative, made up mainly from the two Elohistic (or, as they are now generally called, the Elohistic and the Levitical) documents. Fragments of an account of the conquest of Canaan older than either of these writings are preserved in the book of Judges, and it is generally recognized by recent inquirers that the progress of the Israelites was much slower and their action less united than appears on the face of the book of Joshua as we now read it, the statistics of the Levitical record in particular applying properly to a much later date. From this point of view Joshua appears rather as the leader of Ephraim than of all Israel. He is for the north what Caleb was for the south. See ISRAEL and JUDGES, and compare a paper by Meyer in Stade's *Zeitsch. f. ATliche Wiss.*, vol. i. (1881). See also Ewald, *Geschichte*, vol. ii. The only extra-Biblical notice of Joshua is the inscription of more than doubtful genuineness given by Procopius (*Vand.*, ii. 20) and mentioned also by Moses of Chorene (*Hist. Arm.*, i. 18). It is said to have stood at Tingis in Mauretania, and to have borne that those who erected it had fled before Ἰησοῦς ὁ λῃστης.

JOSIAH, the last but four of the kings of Judah, was the son of Amon, whom he succeeded when only eight years old, the people having declared in his favor against the conspirators who had murdered his unworthy father. The circumstances of the regency which must have existed during his minority are not recorded; it is not until his eighteenth year (for 2 Chr. xxxiv. 3 cannot be set against the explicit testimony of 2 Kings xxii., xxiii.) that he emerges into the light of history, when we find him interested in the repair of the temple at Jerusalem. The religious movement of which this was a symptom took more definite shape with the finding by Hilkiah the high priest of a copy of "the book of the law." The reasons for believing this to have been (substantially at least) the book of Deuteronomy cannot be detailed here. They were already appreciated by Jerome and Chrysostom, and no very careful examination is required to show that the effect of its perusal was to bring about a religious reformation, which in all its features was in accordance with the prescriptions and exhortations of that remarkable composition. The main features of the movement (which extended into the adjoining kingdom of Samaria, at that time a loosely governed Assyrian dependency) have already been sketched in the article ISRAEL. On the secular aspects of the reign of Josiah Scripture is almost wholly silent. Thus nothing is related of the great Scythian invasion, which as we know from Herodotus (i. 105) took place at this period, and must have approached Judah, being probably alluded to by Zephaniah and Jeremiah. The storm which shook the great world powers was favorable to the peace of Josiah's kingdom; the power of Assyria was practically broken, and that of the Chaldeans had not yet developed itself into the aggressive forms it afterwards assumed. But in his thirty-first year Josiah for some unexplained reason was rash enough to place himself in the path of Pharaoh Necho in his military expedition against the king of Assyria; a disastrous encounter took place at Megiddo, in which he lost at once his crown and life (æt. 39).

JÓSIKA, MIKLÓS or NICHOLAS, BARON (1794–1865), the greatest and, next to Jókai, most prolific Hungarian novelist, was born 28th April 1794, at Torda in Transylvania, of aristocratic and wealthy parents. After finishing the usual course of legal studies at Kolozsvár (Klausenburg), he in 1811 at the age of seventeen entered the army, joining a cavalry regiment, with which he subsequently took part in the Italian campaign. In 1813 he was promoted to the grade of sub-lieutenant, and on the battlefield of Mincio (February 8, 1814) to that of lieutenant. Elevated to the rank of captain, he served in the campaign against Napoleon, and was present at the entry of the allied troops into Paris (31st March, 1814). In 1818 Jósika resigned his commission in the army, returned to Hungary, and married his first wife Elizabeth Kallai. The union proving an unhappy one, Jósika parted from his wife, settled on his estate at Szurdok in Transylvania, and devoted himself to agricultural and literary pursuits. Drawn into the sphere of politics, he took part in the memorable Transylvanian diet of 1834. At about this period Jósika first began to attract attention as a writer of fiction. In 1836 he brought out his *Abafi*, 2 vols., which laid the foundation of his literary reputation. He was soon afterwards elected member of the Hungarian Academy of Sciences and of the Kisfaludy Society; of the latter he became, in 1841, director, and in 1842 vice-president. In 1847 Jósika appeared at the Transylvanian diet as second deputy for the county of Szolnok, and zealously supported the movement for the union of Transylvania with Hungary proper. In the same year he was converted to Protestantism, was formally divorced from his wife, and married Baroness Julia Podmaniczky, with whom he continued to live happily until his death. So great was Jósika's literary activity that by the time of the revolution (1848) he had already produced about sixty volumes of romances and novels, besides numerous contributions to literary and political periodicals. Both as magnate of the upper house of the Hungarian diet and by his writings Jósika aided the revolutionary movement, with which he was soon personally identified, being chosen one of the members of the committee of national defence. Consequently, after the capitulation at Világos (13th August, 1849), he found it necessary to flee the country, and settled first at Dresden and then, in 1850, at Brussels, where he resumed his literary pursuits anonymously. In 1864 he removed to Dresden, in which city he died on the 27th February, 1865. The romances of Jósika, written somewhat after the style of Sir Walter Scott, are chiefly of a historical and social-political character, his materials being drawn almost entirely from the annals of his own country. Among his more important works

may be specially mentioned, besides *Abafi—The Poet Zrinyi*, 1843; *The Last of the Batoris*, 1837; *The Bohemians in Hungary*, 1839; *Esther*, 1853; *Francis Rákóczy II.*, 1861; and *A Végváriak*, a tale of the time of the Transylvanian prince Bethlen Gábor, 1864. Many of Jósika's novels have been translated into German, the earlier ones by Klein, Schwarz, Steinacker, and Kovács, and the later by Jósika's second wife Julia, herself an authoress of considerable merit.

See K. Mœnich and S. Vutkovich, *Magyar Irók Névtára*, Budapest, 1876; M. Jókai, "Jósika Miklós Emlékezete," *A Kisfaludy-Társaság Evlapjai Új folyam*, vol. iii., Pest, 1869; G. W. Steinacker, *Ungarische Lyriker*, Leipsic, 1874. Cf. also Jósika's autobiography—*Emlékirat*, Pest, 1865, vol. iv.

JOSQUIN. See DEPRÈS JOSQUIN, vol. vii. p. 88, musical composer, ordinarily designated by the name Josquin.

JOST, ISAAK MARKUS (1793–1860), historical writer, was born on February 22, 1793, at Bernburg, and studied at the gymnasium of Wolfenbüttel, whence he passed successively to the universities of Göttingen and Berlin. In Berlin he taught a school from 1826 till 1835, when he received the appointment of upper master in the Jewish commercial school (called the Philanthropin) at Frankfort-on-the-Main. Here he remained until his death, 20th November, 1860. The work by which he is chiefly known is a *Geschichte der Israeliten*, in 9 vols. (Berlin, 1820–29), which was afterwards supplemented by *Neuere Geschichte der Israeliten von* 1815–45 (Berlin, 1846–47), and *Geschichte des Judenthums u. seiner Sekten* (Leipsic, 1857–59). He also published an abridgment of the *Geschichte* under the title *Allgemeine Geschichte des jüdischen Volks* (1831–32), and an edition of the Mishna with a German translation and notes (in 6 vols., 1832–34). The *Israelitische Annalen* were edited by him from 1839 to 1841 and he contributed extensively on pedagogic and historical subjects to scientific journals.

JOUFFROY, THEODORE-SIMON (1796–1842), a French philosopher, was born at Pontets, near Mouthe, department of Doubs, 1796. In his tenth year, his father, who was a taxgatherer, sent him to an uncle at Pontarlier, under whom he commenced his classical studies. At Dijon his compositions attracted the attention of an inspector who had him placed (1814) in the Normal School, Paris. He there came under the influence of Cousin, and in 1817 he was appointed assistant professor of philosophy at the Normal and Bourbon schools. Three years later, being thrown upon his own resources, he began a course of lectures in his own house, and formed literary connections with *Le Courrier Français*, *Le Globe*, *L'Encyclopédie Moderne*, and *La Revue Européenne*. The variety of his pursuits at this time carried him over the whole field of ancient and modern literature. But he was chiefly attracted to the philosophical system represented by Reid and Stewart. The application of "common sense" to the problem of substance supplied a more satisfactory analytic for him than the scepticism of Hume which reached him through a study of Kant. He thus threw in his lot with the Scotch philosophy, and his first dissertations are, in their leading position, adaptations from *The Inquiry*. His tendency towards eclecticism makes his philosophical position undefinable, but his limpid style and capacity for generalizing historical movements are as distinct in his earlier as in his later works. In 1826 he wrote a preface to a translation of the *Moral Philosophy* of Stewart, demonstrating the possibility of a scientific statement of the laws of consciousness; in 1828 he began a translation of the works of Reid, and in his preface estimated the influence of Scotch criticism upon philosophy, giving a biographical account of the movement from Hutcheson onwards. In the same year he assisted Milon in ancient philosophy at the Faculty of Letters, and, while carrying on a course upon recent philosophy, he returned to the Normal School in 1830. Next year he was returned to parliament by the arrondissement of Pontarlier; but the work of legislation was ill-suited to his powers. Swift, practical decisions on questions demanding immediate settlement were repugnant to his habits of mind. He tried to introduce a reform in the manner of considering petitions,—his sole suggestion of any weight during the years of his representation; though he frequently spoke, he never gained any real influence. Yet he attended to his parliamentary duties conscientiously, and ultimately broke his health in their discharge. In 1833 he was appointed professor of Greek and Roman philosophy at the college of France and a member of the Academy of Sciences; he then published the *Mélanges Philosophiques*, a collection of fugitive papers in criticism and philosophy and history. In them is foreshadowed all that he afterwards worked out in metaphysics, psychology, ethics, and æsthetics. He had already demonstrated in his prefaces the possibility of a psychology apart from physiology, of the science of the phenomena of consciousness distinct from the perceptions of sense. He now classified the mental faculties, premising that they must not be confounded with capacities or properties of mind. They were, according to his analysis, personal will, primitive instincts, voluntary movement, natural and artificial signs, sensibility and the faculties of intellect; on this analytic he founded his scheme of the universe. In 1835 he published a *Cours de Droit Naturel*, which, for precision of statement and logical coherence, is the most important of his works. Starting from the conception of a universal order in the universe, he reasons from it to a Supreme Being, who has created it and who has conferred upon every man in harmony with it the aim of his existence leading to his highest good. As to the nature of good and evil, how is it to be judged? The good, he says, is the fulfilment of man's destiny, the evil the thwarting of it. Every man being organized in a particular way has, of necessity, an aim, the fulfilment of which is good; and he has faculties for accomplishing it, directed by reason. The aim is only good, however, when reason guides it for the benefit of the majority, but that is not absolute good. When reason rises to the conception of universal order, when actions are submitted, by the exercise of a sympathy working necessarily and intuitively, to the idea of universal order, the good has been reached, the true good, good in itself, absolute good. But he does not follow his idea into the details of human duty, though he passes in review fatalism, mysticism, pantheism, scepticism, egotism, sentimentalism, and rationalism. In 1835 his health failed and he went to Italy, where he continued to translate the Scotch philosophers. On his return he became librarian to the university, and took the chair of recent philosophy at the Faculty of Letters. He died in Paris, 4th February, 1842. After his death were published *Nouveaux Mélanges Philosophiques* and *Cours d'Esthétique*. The former contributed nothing new to the system except a more emphatic statement of the distinction between psychology and physiology. The latter formulated his theory of beauty. The beautiful, by his analysis, is that which æsthetically pleases, without consideration of interest. Utility being defined as the satisfaction of human wants, the beautiful may be useless. Order and proportion he takes to be the components of beauty,—an order and proportion not leading to the useful, but giving pleasure without consideration of the end. Unity and variety are the conditions of beauty; it demands their coexistence, the former for the satisfaction of sensibility, the latter of intelligence. Jouffroy's claim to distinction rests upon his ability as an expositor of other men's ideas. He founded no system; he contributed nothing of importance to philosophical science; he initiated nothing which has survived him. But his enthusiasm for mental science, and his command over the language of popular exposition, made him a great, international

medium for the transfusion of ideas. He stood between Scotland and France and Germany and France; and, though his expositions are vitiated by loose reading of the philosophers he interpreted, he did serviceable, even memorable work.

JOURDAIN, Alfonse, count of Toulouse, son of Count Raymond IV. by his third wife, Elvire de Castile, was born in 1103, in the castle of Mont-Pèlerin, Tripoli. His father died when he was two years old, and he remained under the guardianship of the count of Cerdagne until he was five. He was then taken to Europe, and his brother gave him Rouergue; in his tenth year he succeeded to the government of Narbonne, Toulouse, and Provence, but Toulouse was taken from him by the duke of Aquitaine while he was still in his minority. After the duke's death the inhabitants of Toulouse revolted and recalled Jourdain; he returned in triumph in 1123. He, however, drew upon himself a sentence of excommunication by his treatment of the religious community of St. Gilles, which had previously thrown in its influence on the side of the duke of Aquitaine. He had next to fight for the sovereignty of Provence against Raymond Beranger III., and not till September, 1125, did the war end in an amicable agreement. Under it Jourdain became absolute master of the regions lying between the Pyrenees and the Alps, Auvergne and the sea. His ascendency was an unmixed good to the country, for during a period of fourteen years art and industry were successfully prosecuted. Louis VII., for some reason which has not appeared, besieged Toulouse in 1141, but without result. Next year Jourdain again incurred the displeasure of the church by siding with the rebels of Montpellier against their lord. A second time he was excommunicated. But his isolation from Rome did not suit his taste or policy; so in the autumn of 1144 he took the cross at the meeting of Vézelay called by Louis VII., and three years later he embarked for the East. He lingered on the way in Italy, and probably in Constantinople; but in 1148 he had arrived at Acre. Among his companions he had made enemies, and he was destined to take no share in the crusade he had joined. He was poisoned at Acre before hostilities commenced, either the wife of Louis or the mother of the king of Jerusalem suggesting the draught.

JOUVENET, Jean (1647–1717), born at Rouen in 1647, came of a family of painters, one of whom had had the honor of teaching Poussin. He early showed remarkable aptitude for his profession, and on arriving in Paris, attracted the attention of Le Brun, by whom he was employed at Versailles, and under whose auspices, in 1675, he became a member of the Royal Academy, of which he was elected professor in 1681, and one of the four perpetual rectors in 1707. The great mass of works that he executed, chiefly in Paris, many of which, including his celebrated Miraculous Draught of Fishes (engraved by Audran; also Landon, *Annales*, i. p. 42), are now in the Louvre, show his fertility in invention and execution, and also that he possessed in a high degree that general dignity of arrangement and style which distinguished the school of Le Brun. Jouvenet died on April 5, 1717, having been forced by paralysis during the last four years of his life to work with his left hand. See *Mém. Inéd. Acad. Roy. de P. et de Sc.*, 1854, and D'Argenville, *Vies des Peintres*.

JOVELLANOS, or Jove Llanos, Gaspar Melchor de (1744–1811), statesman and author, was born at Gijon in Asturias, Spain, January 5, 1744. Selecting law as his profession, he studied at Oviedo, Avila, and Alcala, and in 1767 became criminal judge at Seville. His integrity and ability were rewarded in 1778 by a judgeship in Madrid, and in 1780 by appointment to the council of military orders. In the capital Jovellanos took a good place in the literary and scientific societies; for the society of Friends of the Country he wrote in 1787 his most valuable work, *Informe sobre un proyecto de Ley Agraria*. Involved in the disgrace of his friend, the brilliant French adventurer Cabarrus, Jovellanos spent the years 1790 to 1797 in a sort of banishment at Gijon, engaged in literary work and in founding the Asturian institution for agricultural, industrial, social, and educational reform throughout his native province. This institution continued his darling project up to the latest hours of his life. Summoned again to public life in 1797, Jovellanos refused the post of ambassador to Russia, but accepted that of minister of grace and justice, under "the Prince of the Peace," whose attention had been directed to him by Cabarrus, then a favorite of Godoy. Displeased with Godoy's policy and conduct, Jovellanos combined with his colleague Saavedra to procure his dismissal. They were but temporarily successful; Godoy returned to power in 1798; Jovellanos was again sent to Gijon, but in 1801 was thrown into prison in Majorca. The revolution of 1808, and the advance of the French into Spain, set him once more at liberty. Joseph Bonaparte, on mounting the Spanish throne, made Jovellanos the most brilliant offers; but the latter sternly refusing them all, joined the patriotic party, became a member of the central junta, and contributed to reorganize the cortes. This accomplished, the junta at once fell under suspicion, and Jovellanos was involved in its fall. To expose the conduct of the cortes, and to defend the junta and himself were the last labors of his pen. In 1811 he was enthusiastically welcomed to Gijon; but the approach of the French drove him forth again. The vessel in which he sailed was compelled by stress of weather to put in at Vega in Asturias, where, on November 27, 1811, Jovellanos died.

The poetical works of Jovellanos comprise a tragedy *El Pelayo*, the comedy *El Delincuente Honrado*, satires, and miscellaneous pieces, including a translation of the first book of *Paradise Lost*. His prose works, especially those on political and legislative economy, constitute his real title to literary fame. In them depth of thought and clear-sighted sagacity are couched in a certain Ciceronian elegance and classical purity of style. Besides the *Ley agraria* he wrote *Elogios;* various political and other essays; and *Memorias Politicas*, 1801, suppressed in Spain, and translated into French, 1825. An edition of his complete works was published at Madrid, 1831–32, in 7 vols., and another at Barcelona, 1839.

See *Noticias historicas de Don G. M. de Jovellanos*, Palma, 1812, and *Memorias para la vida del Señor . . . Jovellanos*, by J. A. C. Bermudez, Madrid, 1814, both reviewed in the *Foreign Quarterly Review*, No. x.

JOVIANUS, Flavius Claudius, Roman emperor from June 27, 363, to February 17, 364, was the son of the brave general Varronianus, and was born at Singidunum in Mœsia about 332. As captain of the guard (*primus ordinis domesticorum*) he accompanied Julian in his Persian expedition; and on the day after that emperor's death, when the aged Sallust declined the purple, the voices of the army beyond the Tigris were united in Jovian's favor. It was perhaps the absence of any very invidious ability, no less than his father's reputation, that set Jovian on the throne. The new emperor's first care was to continue the retreat begun by Julian; and he had with difficulty reached the rapid and well-nigh unpassable Tigris, when overtures of peace were made by the Persian king Sapor II., who had not ceased to harass the Roman march. Jovianus was not in a position to command easy terms; the famished and exhausted state of his army compelled his assent to a humiliating treaty, which gave up to the Persians the provinces of Arzanene, Corduene, Mexoene, Rehimene, and Zabdicene, which had been conquered by Galerius in 297, and Nisibis and other cities. From this time the Greek and Christian influence dates its decline in the trans-Euphrates regions. Jovian was anxious to reach Constantinople in order to establish his power; but the news of the loyalty of the western legions gladdened him while still on the march through Asia Minor. After issuing a decree by which Christianity was restored as the state religion, though

paganism was recognized, the emperor assumed the consulship at Aneyra, on January 1, 364, with his infant son as colleague. Within two months, on February 17, 364, Jovianus was found dead in his bed at Dadastana, a small town of Galatia. A surfeit of mushrooms or the fumes of a charcoal fire have been assigned as the causes of death. The suspicion of foul play is unsupported by evidence. He was succeeded by Valentinian and Valens, after an interregnum of ten days.

Besides the ancient historians of the period, see Gibbon's *Decline and Fall*; Le Beau's *Bas-Empire*; Finlay's *Greece under the Romans*; and the Abbé de la Bléterie's *Histoire de Jovien*, Amsterdam, 1740. In Syriac literature Jovian (Iobinianos) became the hero of a Christian romance, published by George Hoffman (*Julianus der Abtrünnige*, 1880). Compare the account of this work by Nöldeke, *Z. D. M. G.*, vol. xxviii.

JOVINIANUS, or JOVIANUS, a Roman monk and reputed heretic who flourished during the latter half of the 4th century. All our knowledge of him is derived from a passionately hostile polemic of Jerome (*Adv. Jovinianum Libri II.*), written at Bethlehem, and without any personal acquaintance with the man assailed, in 393 A.D. According to this authority he in 388 was living at Rome the celibate life of an ascetic monk, possessed a good acquaintance with Scripture, and was the author of several minor works, but, undergoing an heretical change of view, afterwards became a self-indulgent Epicurean and unrefined sensualist. The doctrinal heresies which had provoked the wrath of Jerome were mainly these:—(1) he held that in point of merit, so far as their domestic state was concerned, virgins, widows, and married persons who had been baptized into Christ were on a precisely equal footing; (2) those who with full faith have been regenerated in baptism cannot be overthrown (or, according to another reading, tempted) of the devil; (3) to abstain from meats is not more praiseworthy than thankfully to enjoy them; (4) all who have preserved their baptismal grace shall receive the same reward in the kingdom of heaven. Jerome's bitter polemic was chiefly provoked by those views of Jovinian as to fasting and marriage, in which the entire Protestant world has declared itself substantially at one with the so-called heretic. He was, however, condemned by a Roman synod under Bishop Siricius in 390, and afterwards excommunicated by another at Milan under the presidency of Ambrose. The year of his death is unknown, but he is referred to as being no longer alive in Jerome's *Contra Vigilantium*, which was composed in 406.

JOVIUS, PAULUS, or PAOLO GIOVIO (1483–1552), an Italian historian and biographer, was born of an ancient and noble family at Como, April 19, 1483. His father died when he was a child, and Giovio owed his education to his brother Benedetto. After studying the humanities, he applied himself to medicine and philosophy at his brother's request. He was Pomponazzi's pupil at Padua; and afterwards he took a medical degree in the university of Pavia. But the attraction of literature proved irresistible for Giovio, and he was bent upon becoming the historian of his age. Some time, probably in or after 1516, he went to Rome, with a portion of his history already finished. This he presented to Leo X., who read the MS., and pronounced it superior in elegance to anything which had been produced since the decades of Livy. Giovio, encouraged by the success of his first step in authorship, took up his residence in Rome, and attached himself to the court of the cardinal Giulio de' Medici. The next pope, Adrian VI., gave him a canonry in his native town of Como, on the condition, it is said, that Giovio should mention him with honor in his history. This patronage from a pontiff who was averse to the current tone of Italian humanism, proves that Giovio at this period passed for a man of sound learning and sober manners. After Adrian's death, Clement VII. assigned him chambers in the Vatican, with maintenance for servants befitting a courtier of rank. In addition to other benefices, he finally, in 1528, bestowed on him the bishopric of Nocera. Giovio had now become in a special sense dependent on the Medici. He was employed by that family on several missions,—as when he accompanied Ippolito to Bologna on the occasion of Charles V.'s coronation, and Caterina to Marseilles before her marriage to the duke of Orleans. During the siege of Rome in 1527 he attended Clement in his flight from the Vatican. While crossing the bridge which connected the palace with the castle of S. Angelo, Giovio threw his mantle over the pope's shoulders in order to disguise his master.

In the sack he suffered a serious literary loss, if we may credit his own statement. The story runs that he deposited the MS. of his history, together with some silver, in a box at S. Maria Sopra Minerva for safety. This box was discovered by two Spaniards, one of whom secured the silver, while the other, named Herrera, knowing who Giovio was, preferred to hold the MSS. for ransom. Herrera was so careless, however, as to throw away the sheets he found in paper, reserving only that portion of the work which was transcribed on parchment. This he subsequently sold to Giovio in exchange for a benefice at Cordova, which Clement VII. conceded to the Spaniard. Six books of the history were lost in this transaction. Giovio contented himself with indicating their substance in a summary. Perhaps he was not unwilling that his work should resemble that of Livy, even in its imperfection. But doubt rests upon the whole of this story. Apostolo Zeno affirms that in the middle of the last century three of the missing books turned up among family papers in the possession of Count Giov. Batt. Giovio, who wrote a panegyric on his ancestor. It is therefore not improbable that Giovio possessed his history intact, but preferred to withhold those portions from publication which might have involved him in difficulties with living persons of importance. The omissions were afterwards made good by Curtio Marinello in the Italian edition, published at Venice in 1581. But whether Marinello was the author of these additions is not known.

After Clement's death Giovio found himself out of favor with the next pope, Paul III. The failure of his career is usually ascribed to the irregularity of the life he led in the literary society of Rome. We may also remember that Paul had special causes for animosity against the Medici, whose servant Giovio had been. Despairing of a cardinal's hat, Giovio retired to his estates at Como, where he spent the wealth he had acquired from donations and benefices in adorning his villa with curiosities, antiquities, and pictures. He died upon a visit to Florence in 1552.

Giovio's principal work was the *History of his own Times*, from the invasion of Charles VIII. to the year 1547. It was divided into two parts, containing altogether forty-five books. Of these, books v.–xi. of part i. were said by him to have been lost in the sack of Rome, while books xix.–xxiv. of part ii., which should have embraced the period from the death of Leo to the sack, were never written. Giovio supplied the want of the latter six books by his lives of Leo, Adrian, Alphonso I. of Ferrara, and several other personages of importance. But he alleged that the history of that period was too painful to be written in full. His first published work, printed in 1524 at Rome, was a treatise *De Piscibus Romanis*. After his retirement to Como he produced a valuable series of biographies, entitled *Elogia Virorum Illustrium*. They commemorate men distinguished for letters and arms, selected from all periods, and are said to have been written in illustration of portraits collected by him for the museum of his villa at Como. Besides these books, we may mention a biographical history of the Visconti, lords of Milan; an essay on mottoes and badges; a dissertation on the state of Turkey; a large collection of familiar epistles; together with descriptions of Britain, Muscovy, the Lake of Como, and Giovio's own villa. The titles of these miscellanies will be found in the bibliographical note appended to this article.

Giovio preferred Latin in the composition of his more important works. Though contemporary with Machiavelli, Guicciardini, and Varchi, he adhered to humanistic usages, and cared more for the Latinity than for the matter of his histories. His style is fluent

and sonorous, rather than pointed or grave. Partly owing to the rhetorical defects inherent in this choice of Latin, when Italian had gained the day, but more to his own untrustworthy and shallow character, Giovio takes a lower rank as historian than the bulk and prestige of his writings would seem to warrant. He professed himself a flatterer and a lampooner. The old story that he said he kept a golden and an iron pen, to use according as people paid him, condenses the truth in epigram. He had the faults of the elder humanists, in combination with that literary cynicism which reached its height in Aretino; and therefore his histories and biographical essays are not to be used as authorities, without corroboration. Yet Giovio's works, taken in their entirety and with proper reservation, have real value. To the student of Italy they yield a lively picture of the manners and the feeling of the times in which he lived, and in which he played no obscure part. They abound in vivid sketches, telling anecdotes, fugitive comments, which unite a certain charm of autobiographical romance with the worldly wisdom of an experienced courtier. A flavor of personality makes them not unpleasant reading. While we learn to despise and mistrust the man in Giovio, we appreciate the litterateur. It would not be too far-fetched to describe him as a sort of 16th century Horace Walpole.

Bibliography.—The sources of Giovio's biography are—his own works; Tiraboschi's *History of Italian Literature;* Litta's *Genealogy of Illustrious Italian Families;* and Giov. Batt. Giovio's *Uomini illustri della Diocesi Comasca,* Modena, 1784; Cicogna, in his *Delle Inscrizioni Veneziane Raccolta* (Venice, 1830), gives a list of Giovio's works, from which the following notices are extracted:—1. Works in Latin,—(1) *Pauli Jovii Historiarum sui temporis,* Florence, 1550–52, the same translated into Italian by L. Domenichi, and first published at Florence, 1551, afterwards at Venice; (2) *Leonis X., Hadriani VI., Pompeii Columnæ Card., Vitæ,* Florence, 1548, translated by Domenichi, Florence, 1549; (3) *Vitæ XII. Vicecomitum Mediolani principum,* Paris, 1549, translated by Domenichi, Venice, 1549; (4) *Vita Sfortiæ clariss. ducis,* Rome, 1549, translated by Domenichi, Florence, 1549; (5) *Vita Fr. Ferd. Davali,* Florence, 1549, translated by Domenichi, *ibid.,* 1551; (6) *Vita magni Consalvi, ibid.,* 1549, translated by Domenichi, *ibid.,*1550; (7) *Alfonsi Atestensi,* etc. *ibid.,* 1550, Italian translation by Giov. Batt. Gelli, Florence, 1553; (8) *Elogia virorum bellica virtute illustrium, ibid.,* 1551, translated by Domenichi, *ibid.,* 1554; (9) *Elogia clarorum virorum,* etc., Venice, 1546 (these are biographies of men of letters), translated by Hippolito Orio of Ferrara, Florence, 1552; (10) *Libellus de legatione Basilii Magni principis Moscoviæ,* Rome, 1525; (11) *Descriptio Larii Lacus,* Venice, 1559; (12) *Descriptio Britanniæ,* etc., Venice, 1548; (13) *De Romanis Piscibus,* Rome, 1524. 2. Works in Italian,—(1) *Dialogo delle Imprese militari et amorose,* Rome, 1555;—(2) *Lettere Volgari,* Venice, 1560. Some minor works and numerous reprints of those cited have been omitted from this list; and it should also be mentioned that some of the lives, with additional matter, are included in the *Vitæ Illustrium Virorum,* Basel, 1576. (J. A. S.)

JUANES, or JOANES, VICENTE (1523–1579), head of the Valencian school of painters, and often called "the Spanish Raphael," was born at Fuente de la Higuera in the province of Valencia in 1523. Of his biography practically no authentic facts have been preserved. He is said to have studied his art for some time in Rome, with which school his affinities are closest, but the greater part of his professional life was spent in the city of Valencia, where most of the extant examples of his work are now to be found. All relate to religious subjects, and are characterized by dignity of conception, accuracy of drawing, truth and beauty of color, and minuteness of finish. The best known are the Entombment, the Nativity, the Burial of a Monk, and the Martyrdom of St. Agnes. His style is also seen to full advantage in the series on the life of St. Stephen, originally painted for the church of San Esteban in Valencia, and now in the Museo at Madrid. He died at Bocairente (near Jativa) while engaged upon an altarpiece in the church there, on 21st December, 1579.

JUAN FERNANDEZ, a small island in the South Pacific in 34° S. lat., 400 miles west of Valparaiso. The Spaniards also designate it *Mas-a-Tierra,* "more to land," to distinguish it from a smaller island, *Mas-a-Fuera,* "more to sea," 9 miles farther west. The aspect of Juan Fernandez is beautiful and striking; only 13 miles in length by 4 in width, it consists of a series of precipitous rocks rudely piled into irregular blocks and pinnacles. The highest of these masses (about 3000 feet), a fine object from the anchorage, is called, from its massive form, *El Yunque,* the Anvil; it appears to be inaccessible. Any attempt to scale the higher peaks of the island is dangerous; the soil is very light and shallow, and the vegetation mostly a shrubbery under growth, and on any attempt to pull one's self up by the help of this, the whole is apt to give way, and climber and shrubs are precipitated together down the cliffs. The rocks are trap-tuffs, basalts, and green-stones, and the island seems to date back to the older trappean series. There is a doubtful story of light having been seen emanating from one of the higher peaks; but it seems likely that if Juan Fernandez was ever a subaerial volcanic cone, its fires have been long extinguished. Small indentations are found all round the island, but Cumberland Bay on the north side is the only good anchorage, and even there, from the great depth of water, there is some difficulty and risk.

A wide valley collecting streams from several of the ravines on the north side of the island opens into Cumberland Bay, and is partially enclosed and cultivated; and the settlement, consisting of some thirty or forty dilapidated Chilian huts, faces the anchorage. As seen from the bay the mountains seem covered with foliage to the sky-line, except where precipitous faces of rock—basalt and green-stone—form a beautiful contrast to the luxuriant somewhat pale vegetation so characteristic of an island in the warmer temperate zone.

The flora and fauna of Juan Fernandez are in most respects Chilian—the opportunities of immigration from any other direction being specially difficult, for nearly constant currents set from the southwest, a direction in which there is no land nearer than the ant aretic continent. There are few trees on the island, and these are chiefly in inaccessible situations, the timber near the shore having been almost entirely cut down for fire-wood. Most of the valuable indigenous trees have been exterminated; the sandal-wood, which the earlier navigators found one of the most valuable products of the island, is now confined to almost inaccessible places, while the other prominent indigenous forms, a native palm (*Ceroxylon australe*) and two tree-ferns, may be counted on the fingers as they raise their feathery heads over some overhanging crag or precipitous ravine. The steep paths up the hills are bordered by a thicket of flowering shrubs and herbs chiefly of South American origin. One of the most prominent of the latter (*Gunnera chilensis*) expands its gigantic rhubarb-like leaves to an enormous size, while the procumbent rhizomes creep along the ground, throwing up leaf-stalks 8 and 10 feet in height, and forming with the leaves, which frequently measure 15 feet across, a canopy under which one can ride easily on the small Chilian horses. There are twenty-four species of ferns on the island, and of these four are special to it; so great a prevalence of ferns gives quite a character to the island flora.

The fauna of Juan Fernandez is likewise fairly rich and very special. There are no indigenous land mammals on the island. Pigs, which have long since become wild and numerous, were left by the earlier navigators, and wild goats imported in the same fashion are now abundant, and their flesh is excellent. Sea-elephants and fur-seals were at one time plentiful upon Juan Fernandez, and are still found in some numbers at Mas-a-Fuera. There are, besides the *Accipitres* and the *Natatores,* four land birds on Juan Fernandez

(and four somewhat different on Mas-a-Fuera). The four Juan Fernandez birds are a thrush, a tyrant, and two humming-birds (*Eustephanus fernandensis* and *E. galerites*). The thrush and *Eustephanus fernandensis* are special to the island, and the latter has the great peculiarity of having the male of a bright cinnamon color while the female is green. Both sexes are green in *E. galerites*. Of the shrubs in the jungle bordering the ravine, there seems scarcely a plant of myrtle, or of a bignoniaceous plant with long dark bells associated with the myrtle, which is not inhabited by a pair of humming-birds, so that the whirring and buzzing of the brilliant flutterers over the flowers is singularly attractive.

Juan Fernandez was discovered by a Spanish pilot of that name (who was also the discoverer of the island of Mas-a-Fuera) in 1563. Fernandez obtained from the Spanish Government a grant of the islands, where he resided for some time, stocking them with goats and pigs. He soon, however, appears to have abandoned his possessions, which were afterwards for many years only visited occasionally by fishermen from the coasts of Chili and Peru, who found the sea round the island well stocked with fish. In 1616 Le Maire and Schouten called at Juan Fernandez for water and fresh provisions. Pigs and goats were then abundant on the island, and the valleys coming down to the anchorage were filled with herbage and the sea with excellent fish. Sandal-wood was plentiful, and near the anchorage there was a grove of wild quince trees. The fleet under the command of Admiral l'Ermite next visited the island. Three soldiers and three gunners remained behind when the fleet left; what became of these is altogether unknown. In the year 1668 the buccaneer Sharp anchored off Juan Fernandez, at first apparently on the south side of the island and afterwards in Cumberland Bay. At the time of his visit seals and sea-lions frequented the shores in large numbers, and pigs, the descendants of those originally imported by Fernandez, were so abundant that a hundred were salted down in addition to those killed for immediate use. At the end of 1687 five men voluntarily remained at Juan Fernandez from another buccaneer commanded by Captain Edward Davis. They remained on the island until October, 1690, when the English ship "Welfare," Captain John Story, took them off.

In February, 1700, Dampier called at Juan Fernandez, and whilst there Captain Straddling of the "Cinque Porte" galley quarrelled with his men, forty-two of whom deserted but were afterwards taken on board by Dampier; five seamen, however, remained on shore. In October, 1704, the "Cinque Porte" returned and found two of these men, the others having been apparently captured by the French. On this occasion Captain Straddling had a disagreement with his master, Alexander Selkirk, who insisted upon being put on shore rather than serve longer with Straddling. Selkirk's desire was complied with, and he was sent on shore with a few ordinary necessaries. Before the ship left he begged to be readmitted; but this was refused, with the curious result that, with little merit of his own, Selkirk has become a hero for all time, and "Robinson Crusoe's Island" the cynosure of all boys' eyes. It is extremely improbable that Alexander Selkirk ever actually placed his journal in the hands of Defoe, but his story excited some public interest, and in catering for the public amusement that prince of raconteurs was most likely to have adopted Selkirk's tale for combination with other material in one of his wonderful "realistic novels." Many of the incidents in the *Adventures of Robinson Crusoe* are evidently inconsistent with the narrative of Selkirk, and are undoubtedly taken from other sources; for example, the footprint on the sand, and the decidedly tropical description of "Robinson Crusoe's Island," would agree better with one of the outlying islands of the West Indies. Alexander Selkirk was relieved from what appears to have been a by no means unbearable exile, in 1709, by the ship "Duke," Captain Woodes Rogers, and in 1868 the officers of H.M.S. "Topaze" erected a tablet at a point on the hill road called "Selkirk's Lookout," just where in a gap in the trap rock a magnificent view may be had of the whole island, and of the sea north and south, over which the exile must have often and eagerly watched for an approaching sail. It bears the following inscription:—"In memory of Alexander Selkirk, mariner, a native of Largo, in the county of Fife, Scotland, who was on this island in complete solitude for four years and four months. He was landed from the 'Cinque Porte' galley, 96 tons, 16 guns, 1704 A.D., and was taken off in the 'Duke' privateer, 12th February, 1709. He died lieutenant of the 'Weymouth,' 1723 A.D., aged forty-seven years. This tablet is erected near Selkirk's Lookout by Commodore Powell and officers of H.M.S. 'Topaze,' 1868 A.D."

After Selkirk's relief, visits, especially from buccaneers, to the island of Juan Fernandez became more frequent. In June, 1741, Commodore Anson anchored in Cumberland Bay in the "Centurion." During Anson's stay the "Trial" visited Mas-a-Fuera, and found the anchorage more exposed than at Juan Fernandez. Anson found vegetables, of which the scurvy-struck crew of the "Centurion" stood greatly in need, much as formerly,—the cabbage palm, celery, water-cresses, and radishes being abundant. After having added to the resources of the island by sowing the stones of fruit trees and garden seeds, some of which did well, Anson continued his voyage in September. On Anson's return home it was proposed to form an English settlement on Juan Fernandez, but the Spaniards hearing that the matter had been mooted in England, gave orders to occupy the island, and it was garrisoned accordingly, in 1750. Carteret first observed this settlement in May, 1767, and on account of the hostility of the Spaniards preferred to put in at Mas-a-Fuera.

After the revolutionary wars Juan Fernandez passed into the possession of the Chilians, and has remained theirs ever since. Shortly after 1818 it was used as a state prison by the Chilian Government. In 1820 there appear to have been 300 convicts on the island, with 100 regular troops. In that year the island was swarming with wild horses, cattle, pigs, sheep, and goats, and vegetables and fruit were in abundance. In 1830 Juan Fernandez was visited by Captain King in H.M.S. "Adventure." There were then no convicts on the island. There was a small garrison of forty persons, and provisions were scarce. In 1833 Juan Fernandez was again used as a convict station by the Chilians. In 1835 the island appears to have been governed by a Mr. Sutcliffe, an Englishman in the Chilian service. He was present when an earthquake took place on the 20th February of that year, of which he gives a description.

In November, 1875, H.M.S. "Challenger," Captain F. T. Thomson, called at Juan Fernandez for two days, lying as usual in Cumberland Bay.

Shortly after 1835, Juan Fernandez was abandoned as a convict settlement, and since that time it has been leased by the Chilian Government, to such as cared to occupy it, for the supply of whalers and other passing ships, and for such remains of sea-lion hunting and fur-sealing as still exist. The speculation does not appear to be very profitable; and the island is likely to be by and by left so far as may be in the busier world of to-day to its pristine solitude. (C. W. T.)

JUAREZ, Benito Pablo (1806–1872), president of Mexico, was born near Ixtlan, in the state of Oajaca, Mexico, March 21, 1806, of full Indian blood. Early left in poverty by the death of his father, he received from a charitable friar a good general education, and afterwards the means of studying law. Beginning to practise in 1834, Juarez speedily rose to professional distinction, and in the stormy political life of his time and country took a prominent part as an exponent of liberal views. In 1832 he sat in the state legislature; in 1846 he was one of a legislative triumvirate for his native state and a deputy to the republican congress, and from 1847 to 1852 he was governor of Oajaca. Banished in 1853 by Santa Anna, he returned to Mexico in 1855 and joined Alvarez, who, after Santa Anna's defeat, made him minister of justice. Under Comonfort, who succeeded Alvarez in December, 1855, Juarez was made president of the supreme court of justice and minister of the interior; and when Comonfort was unconstitutionally replaced by Zuloaga, in 1858, the chief justice, in virtue of his office, claimed to be legal president of the republic. It was not, however, till the beginning of 1861 that he succeeded in finally defeating the unconstitutional party, and in being duly elected president by congress. His decree of July, 1861, suspending for two years all payments on public debts of every kind, led to the landing in Mexico of English, Spanish, and French troops. The first two powers were soon induced to withdraw their forces; but the French remained, declared war in 1862, placed Maximilian upon the throne as emperor, and drove Juarez and his adherents to the northern limits of the republic. Juarez maintained an obstinate resistance, which resulted in final success. In 1867

Maximilian was taken at Quaretero, and shot; and in August Juarez was once more elected president. His term of office was far from tranquil; discontented generals stirred up ceaseless revolts and insurrections; and, though he was re-elected in 1871, his popularity seemed to be on the wane. He died of apoplexy in the city of Mexico, July 18, 1872. In him Mexico lost a statesman of integrity, ability, and determination, whose good qualities are too apt to be overlooked in consequence of his connection with the unhappy fate of Maximilian.

JUBA I., successor to his father Hiempsal on the throne of Numidia, owes his importance much more to the distracted state of the Roman world during the struggle betwixt Cæsar and Pompey than to his intrinsic merit. He embraced Pompey's cause, moved by ancient hereditary friendship to that general, as well as by personal enmity to Cæsar, who had insulted him at Rome a few years before, and to Curio, Cæsar's general in Africa, who had openly proposed when tribune of the plebs in 50 B.C. that Numidia should be sold to colonists, and the king reduced to a private station. In 49 B.C. Juba marched against Curio, who was threatening Utica, and by a stratagem inflicted on the Cæsarean army a crushing defeat, in which Curio was slain. Juba's attention was momentarily distracted by a counter invasion of his territories by Bocchus and Sitius; but, finding that his lieutenant Saburra was able to defend his interests, he rejoined Scipio with a large body of troops. With Scipio he shared the defeat at Thapsus. Fleeing from the field with the Roman general Petreius, the king wandered about for some time as a fugitive, spurned even from the gates of his own city Zama, where he had prepared for a desperate siege. The fugitives at length resolved to die by mutual slaughter. Juba killed Petreius, and sought the aid of a slave in despatching himself (46 B.C.). Juba's character may be summed up in the word savage; he was brave, treacherous, insolent, and cruel.

JUBA II., king of Mauretania, was on the death of his father Juba I. in 46 B.C. carried to Rome, a mere infant, to grace Cæsar's triumph. He seems to have received a good education under the care of Octavianus (afterwards Augustus), whom he accompanied later in his campaign against Antony. In 29 B.C., after Antony's death, Octavianus gave the young African the hand of Cleopatra Selene, daughter of Antony and Cleopatra, and placed him on his paternal throne. In 25 B.C., however, he transferred him from Numidia to the kingdoms formerly held by Bocchus and Boguas, viz., Mauretania Tingitana and Mauretania Cæsariensis, to which was added a part of Gætulia. Juba fixed his royal residence at Jol, whose name he changed to Cæsarea, and which is now identified with the modern Cherchel, about 72 miles west of Algiers. He seems to have reigned in considerable prosperity, though in 6 A.D. the Gætulians rose in a revolt of sufficient importance to afford the surname Gætulicus to Cornelius Cossus, the Roman general whose aid the king called in to suppress it. According to Josephus (*Ant.* xvii. 13, 1 and 4; *B. J.*, ii. 7, 4), Juba married in second nuptials Glaphyra, daughter of Archelaus of Cappadocia, and widow of Alexander, son of Herod the Great, afterwards wife of Alexander's brother, the Archelaus of the New Testament. The date of Juba's death is by no means certain; from the evidence of coins and certain allusions in Strabo, scholars have been led to place it in 19 or 20 A.D.

Juba, to quote the words of Pliny, was more memorable for his writings than for his crown. He wrote many historical and geographical works, of which some seem to have been voluminous and of considerable value on account of the sources to which their author had access. Unfortunately they are known to us only from fragments imbedded in other writers. The list given by C. Müller in his *Fragmenta Historicorum Græcorum* (vol. iii., Paris, 1849), is as follows:—(1) Ῥωμαϊκὴ ἱστορία; (2) Ἀσσυριακά; (3) Λιβυκά; (4) *De Arabia sive De Expeditione Arabica;* (5) *Physiologa;* (6) *De Euphorbia herba;* (7) Περὶ ὄπου; (8) Περὶ γραφικῆς (Περὶ ζωγράφων); (9) Θεατρικὴ ἱστορία; (10) Ὁμοιότητες; (11) Περὶ φθορᾶς λέξεως; (12) Ἐπίγραμμα. Müller (*loc. cit.*) has collected at the head of Juba's fragments the scattered notices of the king from the writers of antiquity. See also Sevin in *Mém. de l'Acad. des Inscriptions*, vol. iv.

JUBBULPORE. See JABALPUR.

JUBILEE, or JUBILE, THE YEAR OF. In Ezek. xlvi. 16, 17, there is indication of a law according to which "the prince" is at liberty to alienate in perpetuity any portion of his inheritance to his sons; but if he give a gift of his inheritance to any other of his subjects, then the change of ownership holds good only till "the year of liberty" (שְׁנַת הַדְּרוֹר), after which the alienated property returns to its original possessor, the prince. This restriction upon the transfer of real property is applied to a greatly enlarged class of persons and cases in Lev. xxv. 8–55, which is by far the most important passage relating to this subject. It is again referred to in Lev. xxvii. 17–25, and the only other allusion to it in the Pentateuch occurs in Numb. xxxvi. 4. According to Lev. xxv. 8–12, at the completion of seven sabbaths of years, the trumpet of the jubilee (שׁוֹפַר תְּרוּעָה) is to be sounded "throughout the land," on the tenth day of the seventh month, *i.e.*, on the great day of atonement. The fiftieth year thus announced is to be "hallowed," *i.e.*, liberty (דרור) is to be proclaimed everywhere to every one, and the people are to return "every man unto his possession and unto his family." The year in other respects is to resemble the sabbatical year; there is to be no sowing, nor reaping that which grows of itself, nor gathering of grapes. Coming to fuller detail,—as regards real property (Lev. xxv. 13–34), the law is that if any Hebrew under pressure of necessity shall alienate his property he is to get for it a sum of money reckoned according to the number of harvests to be reaped between the date of alienation and the first jubilee year; should he or any relation desire to redeem the property before the jubilee, this can always be done by repaying the value of the harvests between the redemption and the jubilee. The fundamental principle is that "the land shall not be sold so as to be quite cut off, for it is mine, and ye are strangers and sojourners with me." The same rule applies to dwelling-houses of unwalled villages; the case is different, however, as regards dwelling-houses in walled cities. These may be redeemed within a year after transfer, but if not redeemed within that period they continue permanently in possession of the purchaser. An exception to this last rule is made for the houses of the Levites in the Levitical cities. As regards property in slaves (Lev. xxv. 35–55), the Hebrew whom necessity has compelled to sell himself into the service of his brother Hebrew is to be treated as a hired servant and a sojourner, and to be released absolutely at the jubilee; non-Hebrew bondmen on the other hand are to be bondmen forever. But the Hebrew who has sold himself to a stranger or sojourner is entitled to freedom at the year of jubilee, and further is at any time redeemable by any of his kindred,—the redemption price being regulated by the number of years to run between the redemption and the jubilee, according to the ordinary wage of hired servants. So much for the Levitical law; as regards its observance, the evidence of history is not voluminous, but Jer. xxxiv. 14 seems to show conclusively that in his time at least the law acknowledged by the prophets was that described in Deut. xv., according to which the rights of Hebrew slave-holders over their compatriots were invariably to cease seven years after they had been acquired. After the exile the law of Lev. xxv. was also certainly disregarded; the Talmudists and Rabbins are unanimous that although the jubilee years were "reckoned" they were not observed.

As regards the meaning of the name "jubilee" (הַיּוֹבֵל שְׁנַת, or simply יוֹבֵל, *ἐνιαυτὸς ἀφέσεως* or *ἄφεσις*, annus jubi-

læi or jubilæus), authorities are not agreed. According to Josephus (*Ant.*, iii. 12, 3), it means ἐλευθερία; but the use of the word יֹבֵל in Exod. xix. 13, Josh. vi. 5, makes it probable that the name is derived from the trumpet sound with which the jubilee was to be proclaimed; and it is not impossible that the old Jewish traditional view is right which states יֹבֵל to mean a ram—for which there is a probable confirmation in Phœnician—and then, by abbreviation for קֶרֶן יֹבֵל, a trumpet of ram's horn. See Dillmann on Exod. xix. 13. If the law of the jubilee is posterior to the time of Jeremiah and Ezekiel, and was not enforced after the exile, the practical difficulties of the institution, especially in its connection with the sabbatical year, call for no remark. Older theologians, by whom all the Pentateuchal laws were regarded as homogeneous parts of a single practical scheme, spent much ingenuity on the explanation of the year of jubilee. Thus Scaliger and many others sought to identify it with the seventh sabbatical year, and so to avoid a succession of two years in which agriculture was suspended. The most ingenious form of this attempt is the theory of Franke (*Nov. Syst. Chron. Fund*, 1778), revived by Klostermann (*Stud. u. Krit.*, 1880, p. 720 *sq.*), which compares the jubilee period with the Egyptian twenty-five year period, and connects it with the intercalation necessary to re-establish the correspondence of the lunar and solar years.

JUBILEE YEAR, in the Roman Catholic Church, is observed every twenty-fifth year, from Christmas to Christmas. During its continuance plenary indulgence is obtainable by all Catholics, on condition of their penitently confessing their sins and visiting certain churches a stated number of times, or doing an equivalent amount of meritorious work. The institution does not go farther back than to the time of Boniface VIII., whose bull is dated April 22, 1300. The circumstances in which it was promulgated are related by a contemporary authority, Jacobus Cajetanus, according to whose account ("Relatio de centesimo s. jubilæo anno" in the *Bibliotheca Patrum*) it had its origin in a wide-spread popular belief then prevalent, which had taken practical shape in an enormous influx of pilgrims to Rome from the 1st of January onwards. The advance upon the recently formulated doctrine of indulgence (see INDULGENCE) was indeed a natural one. Originally the churches of St. Peter and St. Paul in Rome were the only jubilee churches, but the privilege was afterwards extended to the Lateran church and that of Sta Maria Maggiore, and it is now shared also for the year immediately following that of the Roman jubilee by a number of specified provincial churches. At the request of the Roman people, Clement VI. appointed that the jubilee should recur every fifty years instead of every hundred years as had been originally contemplated in the constitution of Boniface; Urban VI. reduced the interval still further to 33 years (the supposed duration of the earthly life of Christ); and by Paul II. it was finally fixed at twenty-five years. According to the special ritual prepared by Alexander VI, in 1500, the pope on the Christmas eve with which the jubilee commences goes in solemn procession to a particular walled-up door ("Porta aurea") of St. Peter's and knocks three times, using at the same time the words of Ps. cxviii. 19 ("Aperite mihi portas justitiæ"). The doors are then opened and sprinkled with holy water, and the pope passes through. A similar ceremony is conducted by cardinals at the other jubilee churches of the city. At the close of the jubilee, the special doorway is again built up with appropriate solemnities. The last ordinary jubilee was observed in 1875. "Extraordinary" jubilees are sometimes appointed on special occasions.

JUBILEES, BOOK OF THE. See APOCALYPTIC LITERATURE, vol. ii. p. 153.

JUDÆA. See PALESTINE.

JUDAH (יְהוּדָה, Yehûda, *i.e.*, according to the etymology given in Gen xxix. 35, "praised"), the name of one of the twelve tribes and of their eponymus the fourth son of Jacob by Leah. Except in the history of Joseph, the Biblical interest attaching to Judah belongs not to the individual but to the tribe; for in Gen. xxxviii. an ethnographical allegory appears transparently enough under the surface of the record. According to the usual form of such statements in the Old Testament, Judah's marriage with the daughter of the Canaânite Shuah is to be referred to a union of the tribe with Canaanite elements. Er and Onan are extinct subdivisions of the mixed population, though a minor family of the former name appears as incorporated with Shelah, the third clan of this branch of the tribe (1 Chron. iv. 21). The details of the disappearance of these ancient stocks are obscure.[1] The stocks of Pharez and Zerah are represented as secondary. They are children of Judah and Tamar, but the former is their father in virtue of an extension of the levirate principle. As the author represents Tamar's conduct as justifiable under the circumstances, the narrative must have taken shape before the levirate law assumed the narrower form given in Deuteronomy.[2] An ingenious explanation of Tamar, Pharez, and Zerah is given by Lagarde, *Orientalia*, ii. (1880). He identifies Tamar (palm tree) with Phœnicia, and regards Zerah (אוֹרח=זרח, *indigena*) as the old Canaanite element of the union which had to yield precedence to the younger Hebrew invaders (Pharez). In any case the narrative of Gen. xxxviii., with all its obscurities, indicates two of the most notable features in the early history of Judah, its mixed character and its long separation from the rest of Israel (ver. 1.) The latter point receives further illustration in the book of Judges. Judah and Simeon seem to have broken off from Israel at Gilgal, and taken a separate course. In the song of Deborah the tribe is not named among the rest, and even in the time of David, Judah and Israel are still more conscious of their separation than of their original unity. Indeed the two soon fell apart again at the division of the kingdom, but after the time of David the idea of unity was never lost; and, while the prophets look for a restoration of the realm of the house of Jesse, Deut. xxxiii. 7 (the work of a poet of Ephraim) prays for victory to Judah against his enemies and his ultimate restoration to his people, the greater Israel of the north. The blessing of Jacob, on the other hand, views Judah in the light of the Davidic sovereignty as holding the hegemony over his brethren until the coming of the Messiah.[3] Our most detailed information as to the tribal history of Judah is derived from 1 Chron. ii. 1–iv. 23. It appears that the tribe absorbed a large element of non-Israelite origin, the Hezronites, or, as the Arabs would now say, the *ḥaḍar*, original nomads who had settled down in villages and towns. To these belonged not only the Jerahmeelites but the Calibbites in Hebron and the southern steppes. It appears to have been the incorporation of these elements that raised Judah to the eminent place which it maintained from the time of David. The details of this important piece of history have been analyzed by Wellhausen, *De gentibus et familiis Judæorum* (Göttingen, 1870).

JUDAS ISCARIOT (Ἰούδας Ἰσκαριώτης or Ἰσκαριώθ), the son of Simon Iscariot (John vi. 71, xiii. 26), and one of the twelve apostles; he is always enumerated last, with special mention of the fact that he was the betrayer of Jesus. If the now generally accepted explanation of his surname (אִישׁ קְרִיּוֹת, *i. e.*, "man of Kerioth," see Josh. xv. 25) be correct, he was the only original member of the apostolic band who was not a Galilæan. (For other suggested etymologies of the name see Winer's *Bibl. Realwörterb.*, *s. v.*) The

[1] Compare the Arabic صَحْل, *Ṣaḥl*, Bulah ed. vi. 147; *Mowaṭṭa*, Cairo ed., iii. 77

[2] Compare Hupfeld, *Ueber die heutige theosophische Theologie*, 1861.

[3] The oldest interpretation of Shiloh, as if it were pointed שֶׁלָּה for (אשר לו) is perhaps the best, especially if with Wellhausen (*Gesch.*, p. 375) we delete the following ולו. The sense then is, "till he comes to whom the people's obedience is due." Another explanation is given by Lagarde (*Onom.*, ii. 95), who takes the word as equivalent to שְׁאִילָה, "he whom Judah prays for." At all events the context demands a Messianic interpretation.

circumstances which led to his admission into the apostolic circle are not stated; according to the Fourth Gospel (vi. 64), his treachery had been foreseen by Jesus from the very first, but this is not suggested by the synoptists. The motives by which he was actuated in rendering to the Jewish authorities the petty and base service of enabling them to arrest his Master without tumult have been analyzed by scholars with very various degrees of subtlety and insight. According to some his sole object was to place Jesus in a position in which He should be compelled to make what had seemed to His followers the too tardy display of His Messianic power: according to others (and their view seems the best supported by the narrative of the Gospels) he was simply an avaricious and dishonest man, who felt that his opportunities for petty peculation—as keeper of the common purse, John xii. 6, xiii. 29—were rapidly disappearing. As regards the effects of his subsequent remorse and the use to which his ill-gotten gains were put, the strikingly apparent discrepancies between the narratives of Matt. xxvii. 3–10 and Acts i. 18, 19 have continually attracted the attention of Biblical scholars ever since Papias, in his fourth book, of which a fragment has been preserved, discussed the subject; the probability is that they simply represent divergent traditions, one of which has possibly been colored by the history of Ahithophel. In ecclesiastical legend and in sacred art Judas Iscariot has taken a prominent place, being generally treated as the very incarnation of treachery, ingratitude, and impiety. The Middle Ages, after their fashion, have supplied the lacunæ in what they deemed his too meagre biography. According to the common form of their story, he belonged to the tribe of Reuben;[1] before he was born his mother Cyborea had a dream that he was destined to murder his father, commit incest with his mother, and sell his God. The attempts made by her and her husband to avert this curse simply led to its accomplishment. At his birth he was enclosed in a chest and flung into the sea; picked up on a foreign shore, he was educated at the court until an act of murder committed in a moment of passion compelled his flight. Coming to Judæa, he entered the service of Pontius Pilate as page, and during this period committed the first two of the crimes which had been expressly foretold. Learning the secret of his birth, he, full of remorse, seeks the prophet who, he has heard, has power on earth to forgive sins. He is accepted as a disciple and promoted to a position of trust, where avarice, the only vice in which he has hitherto been unpracticed, gradually takes possession of his soul, and leads to the complete fulfilment of his evil destiny. This Judas legend, as given by Jacobus a Voragine, obtained no small popularity; and it is to be found in various shapes in every important literature of Europe. For the history of its genesis and its diffusion the reader may consult D'Ancona, *La leggenda di Vergogna e la leggenda di Giuda*, Bologna, 1869, and papers by W. Creizenach in Paul and Braune's *Beitr. zur Gesch. der deutschen Sprache und Literatur*. vol. ii., Halle, 1875, and Victor Diederich in *Russiche Revue*, St. Petersburg, 1880. Cholevius, in his *Geschichte der deutschen Poesie nach ihren antiken Elementen* (Leipsic, 1854), pointed out the connection of the legend with the Œdipus story. The popular hatred of Judas has found strange symbolical expression in various parts of Christendom. In Corfu, for instance, the people at a given signal on Easter eve throw vast quantities of crockery from their windows and roofs into the streets, and thus execute an imaginary stoning of Judas (see Kirkwall, *Ionian Islands*, vol. ii. p. 47). At one time (according to Mustoxidi, *Delle cose corciresi*) the tradition prevailed that the traitor's house and country villa existed in the island, and that his descendants were to be found among the local Jews. Details in regard to some Judas legends and superstitions are given in *Notes and Queries*, 2d series, v., vi., and vii.; 3d ser., vii.; 5th ser., vi.

[1] Other forms make him a Danite, and consider the passage in Genesis (xlix. 17) a prophecy of the traitor.

JUDAS MACCABÆUS. See ISRAEL and MACCABEES.

JUDAS TREE, the *Cercis Siliquastrum* of botanists, belongs to the section *Cæsalpineæ* of the natural family *Leguminosæ*. It is a native of the south of France, Spain, Portugal, Italy, Greece, and Asia Minor, and forms a handsome low tree with a flat spreading head. In spring it is covered with a profusion of purplish pink flowers, which appear before the leaves. The flowers have an agreeable acid taste, and are eaten mixed with salad or made into fritters. The tree was one frequently figured by the older herbalists. One woodcut by Castor Durante is a copy of Lobel's cut, with the addition of the figure of Judas suspended from one of the branches, illustrating the popular tradition regarding this tree. A second species, *C. canadensis*, is common in North America from Canada to Virginia, and differs from the European species in its smaller size and pointed leaves. The flowers are also used in salads and for making pickles, while the branches are used to dye wool a nankeen color.

JUDE, The writer of the epistle of St. Jude (Ἰούδας) calls himself (ver. 1) "the brother of James." In primitive Christian times, among the Judæo-Christians to whom this epistle, from the nature of its contents, must have been addressed, there was but one James who could be thus spoken of without any further description, viz., James "the Lord's brother" (see JAMES). The writer of this epistle, then, claims to be the Judas named among the brethren of the Lord in Matt. xiii. 55, Mark vi. 3. He seems himself to declare by implication that he was not an apostle (ver. 17), and with this agrees the statement (John vii. 5) that at a time not long before the crucifixion the brethren of Jesus did not believe on him. And it is some confirmation of this position that the writer of the epistle of St. James in like manner does not claim to be an apostle. The brethren of the Lord are spoken of in Acts i. 14 as distinct from the apostolic body, and are placed last in the enumeration, as though latest included among the believers; and that their feeling towards Jesus should have been changed since His death and resurrection has been thought to be sufficiently explained by the assertion of St. Paul (1 Cor. xv. 7) that the Lord had been "seen of James" on one special occasion after he had risen from the dead. We conclude therefore that the writer of the epistle was a different person from Jude the apostle, who appears also to have had the names of Lebbæus and Thaddæus (comp. Matt. x. 3, Mark iii. 18, with Luke vi. 16, Acts i. 13).

When we consider the brevity of St. Jude's epistle we can hardly wonder that it did not receive more recognition from the early Christian writers than it has met with. Clemens Alexandrinus (165–220) quotes from this epistle or alludes to its language more than once, as does Tertullian (200), making express mention that the book of Enoch is quoted in it.[2] Origen (186–253) gives several notices of it, and in the Latin translation of some portions of his works, of which the original has been lost, Jude is called an apostle. Nevertheless Eusebius classes the epistle amongst the *ἀντιλεγόμενα*, and its omission from the Syriac version shows us that in one branch of the Christian church it was either not known, or not received for canonical, when that version was made. Jerome in the 4th century gives a reason for its non-acceptance, which perhaps operated with many of the early Christians. He says (*Catalog. Ser. Eccl.*, 4), "Because in it Jude derives a testimony from the book of Enoch, which is apocryphal, it is rejected by most." Yet the canon of Muratori, the date of which is judged to be about 170 A.D., includes the epistle of St. Jude among

[2] The book of Enoch (see vol. ii. p. 153) is cited in Jude 14, and allusions to it occur in 4, 6, 13. Another apocalyptic work, the Assumption of Moses, is the source of Jude 9.

the canonical books, though Justin Martyr (140), Theophilus of Antioch (180), and Irenæus (135–200) make no mention of it. It was early included among the acknowledged Christian writings, and was placed without question among the canonical books by the council of Laodicea.[1]

The persons to whom the epistle was addressed must have been for the most part Judæo-Christians. This is the reason why the writer styles himself "brother of James," and the same is apparent from all the illustrations contained in the letter. The deliverance from Egypt, the fallen angels, the cities of the plain, the legend of Michael's contention with Satan, the references to Cain, Balaam, and Korah, as well as to the prophecy ascribed to Enoch, are all found in so brief a space, and are so touched upon in a manner that could be edifying to none save those who were familiar, not only with Old Testament Scripture, but also with Jewish traditions, that we cannot but conclude that we have here the work of a Jew writing for Jews, although the epistle is included among those called "catholic."

From the notices of the descendants of Jude, the brother of the Lord, preserved by Eusebius (*H. E.*, iii. 19, 20) from Hegesippus, we should conclude that they were resident in Palestine. It seems natural therefore to suppose that the epistle was written in Palestine, and, it may be, for the Jewish converts in some district of that country. But of this we can have no certainty. If, as seems to be intimated by Hegesippus, Jude was dead in the time of Domitian, we perhaps shall not be far wrong in assigning the composition of the epistle to about 80 A.D. All arguments for an earlier date, based on the assumption that in a letter of this character the writer would not have failed to mention the destruction of Jerusalem as an illustration, had that event already taken place, must be disregarded. For the brevity of the letter is such as to deprive this reasoning of all force, while the very recentness of the overthrow of Jerusalem would prevent its destruction from entering as yet into such history as might be used for pointing a moral.

The epistle of St. Jude appears to have been written after the second epistle of St. Peter. Of those corrupt teachers about whom St. Peter spoke in the future tense, "there shall be false teachers among you," St. Jude speaks in the past, "certain men are crept in unawares;" and the like difference is observable throughout the respective letters wherever verbs occur to which it is possible to attach a definite notion of time. But, beside this, St. Peter's letter represents all the corruption which he sees likely to break forth among the Christian community as the outcome of false teaching. Destructive heresies are abroad, and through them many shall be induced to follow lascivious doings, and the way of truth shall be evil spoken of. With a promise of liberty which sounds like a perverse employment of some of St. Paul's language they will lead their followers astray. But in St. Jude's picture the colors seem much darker, and all allusions to teaching, and to the idea that, by lessons such as we know from other sources the Gnostics did give, these men were being beguiled into evil courses through what appeared to be the gate of greater knowledge, have disappeared. The sinners against whom this epistle is directed were avowed libertines and practical unbelievers; they mocked at all sacred things; they were sensual, and had not the Spirit. But stronger than any other reason for believing in the later date of the present epistle is the direct quotation which is made in it from the 2d epistle of St. Peter. In verses 17–18 St. Jude writes, "But ye, beloved, remember ye the words which have been spoken before by the apostles of our Lord Jesus Christ, how that they said to you, In the last time there shall be mockers (ἐμπαῖκται) walking after their own ungodly lusts." The whole of what is here given as apostolic teaching corresponds very closely indeed with the words of 2 Peter iii. 2, while the word ἐμπαῖκται is one that is found nowhere else in the New Testament until it is here quoted by St. Jude.

Attempts have been made to prove that St. Jude's epistle originally appeared in Aramaic, from which the Greek that we have is a translation. But there seems no sufficient evidence for such a conclusion. No doubt a Jew when writing Greek would not unfrequently give expression to his thoughts in a form more or less moulded after his mother tongue, but there are far more points in the epistle which are satisfactory Greek of the date of the New Testament than are the instances which, even after much ingenuity, can be shown to be renderings of Aramaic.

Judæ*, 1821; Stier, *Der Brief Judæ*, 1850; Wiesinger (in Olshausen's *Bibelwerk*), 1854; Hoffmann, *Die Briefe Petri, Judä, und Jacobi*, 1875; Reuss, *Les Épîtres Catholiques*, 1878.

(J. R. L.)

JUDGE, an officer appointed by the sovereign power in a state to administer the law. The duties of the judicial office, whether in a civil or a criminal matter, are to hear the statements on both sides in open court, to arrive at a conclusion as to the truth of the facts submitted to him, or when a jury is engaged, to direct the jury to find such a conclusion, to apply to the facts so found the appropriate rules of law, and to certify by his judgment the relief to which the parties are entitled or the obligations or penalties which they have incurred. With the judgment the office of the judge is at an end, but the judgment sets in motion the executive forces of the state, whose duty it is to carry it into execution. Such is the type of a judicial officer recognized by mature systems of law, but it is not to be accepted as the universal type, and the following qualifying circumstances should be noticed. 1. In primitive systems of law the judicial is not separated from the legislative and other governing functions. 2. Although the judge is assumed to take the law from the legislative authority, yet, as the existing law never at any time contains provision for all cases, the judge may be obliged to invent or create principles applicable to the case. This is called by Bentham and the English jurists judge-made and judiciary law. 3. The separation of the function of judge and jury, and the exclusive charge of questions of law given to the judge, are more particularly characteristic of the English judicial system. During a considerable period in the history of Roman law an entirely different distribution of parts was observed. The adjudication of a case was divided between the *magistratus* and the *judex*, neither of whom corresponds to the English judge. The former was a public officer charged with the execution of the law; the latter was an arbitrator whom the magistrates commissioned to hear and report upon a particular case. The following are points more specially characteristic of the English system and its kindred judicial systems. 1. Judges are absolutely protected from action for anything that they may do in the discharge of their judicial duties. This is true in the fullest sense of judges of the supreme courts. "It is a principle of English law that no action will lie against a judge of one of the superior courts for a judicial act, though it be alleged to have been done maliciously and corruptly." Other judicial officers are also protected, though not to the same extent, against actions. 2. The highest class of judges are irremovable except by what is in effect a special Act of Parliament, viz., a resolution passed by both Houses and assented to by the sovereign. The inferior judges and magistrates are removable for misconduct by the Lord Chancellor. 3. The judiciary in England is not a separate

[1] Many modern critics, following Luther, have questioned the genuineness of the epistle. The libertines against whom it is directed display close affinity to the Carpocratians of the 2d century, of whose heresy Clemens Alexandrinus makes it a prophecy. Mayerhoff, Schenkel, and Mangold suppose that it was written against that heresy not long before the middle of the 2d century. It is also argued that the Muratorian canon seems to regard the epistle as pseudonymous in the same sense as the Wisdom of Solomon.

profession. The judges are chosen from the class of advocates, and almost entirely according to their eminence at the bar. 4. Judges are in England appointed for the most part by the crown. In a few cases municipal corporations may appoint their own judicial officer, and the coroner is elected by the freeholders of the county.

In the United States judges of the supreme courts, as well as ambassadors and other public functionaries, are nominated and appointed by the President with the consent of the Senate, and hold their offices during good behavior. In the separate States the practice varies, but the tendency is in favor of electing the judges and limiting their tenure of office. In the revised constitution of New York of 1846, the principle was established that all public officers, inclusive of the judges, should be chosen by popular election. "The constitutional provision for making judges elective for short periods by universal suffrage is contagious, and every new constitutional reform or establishment tends that way" (Kent's *Commentaries*, i. 295, where a summary of the practice will be found).

JUDGES, The Book of, as we now read it, constitutes a sequel to the book of Joshua, covering the period of history between the death of the son of Nun and the birth of Samuel. But it is well known that the present adjustment of the older historical books of the Old Testament to form a continuous record of events from the creation to the Babylonian exile is due to an editor, or rather to successive redactors, who pieced together and reduced to a certain unity older memoirs of very different dates; and closer examination shows that the continuity of many parts of the narrative is more apparent than real. This is very clearly the case in the book of Judges.

We observe in the first place that the book has two commencements, each of which connects it directly with the book of Joshua (chap. i. 1; ii. 6). But in i. 1 the connection is merely apparent. The events related in chap. i. are there said to have taken place after the death of Joshua, but in reality the chapter covers the same ground with the book of Joshua, giving a brief account of the conquest of Canaan, which in some particulars repeats the statements of the previous book, while in others it is quite independent. It is impossible to regard the warlike expeditions described in this chapter as supplementary campaigns undertaken after Joshua's death; they are plainly represented as the first efforts of the Israelites to gain a firm footing in the centre of the land (at Hebron, Debir, Bethel), in the very cities which Joshua in the book that bears his name is related to have subdued (Josh. x. 39). And this is confirmed by the circumstance that in Judges ii. 1 the "angel of Jehovah," who, according to Exod. xiv. 24, xxiii, 20, xxxii. 34, xxxiii. 2, 7 *sq.*, must be viewed as having his local manifestation at the headquarters of the host of Israel, is still found at Gilgal and not at Shiloh (Josh., xviii. 1). Here then we have an account of the first settlement of Israel west of the Jordan which is parallel to the book of Joshua, but makes no mention of Joshua himself, and places the tribe of Judah in the front. The author of the chapter cannot have had Joshua or his history in his eye at all, and the passage, Josh. xv. 13–19, which corresponds to Judg. i. 10–15, 20, is either derived from our chapter or from an earlier source common to both. It follows from these considerations that the words "Now after the days of Joshua" in Judg. i. 1 are from the hand of the editor, who desired to make the whole book of Judges, including chap. i. read continuously with that which now precedes it in the canon of the earlier prophets.

There are other signs of more than one pen having been engaged on Judges i. Compare, for example, ver. 8 with ver. 21, and see for the details, which are too complicated to be discussed here, Graf, *Der Stamm Simeon*, 1866; Wellhausen-Bleek, *Einleitung*, p. 182; Wellhausen, *Geschichte*, i. 366; Meyer, "Die Eroberung Palästina's" in Stade's *Zeitschrift*, 1881, Hft. i. The chapter was written after Israel had become strong enough to make the Canaanite cities tributary (ver. 28), that is, in the time of the kingship. Meyer, following hints by Wellhausen, brings arguments to show that the original author is the Jahwist of the Pentateuch, of whose work there is but little trace among the sources of Joshua, though it cannot have closed without speaking of the conquest.

The second and main section of our book (chap. ii. 6–xvi.) stands on quite another footing. The opening verses ii. 6–9 repeat the closing words of Joshua's history (Josh. xxiv. 28–31), and so link what follows to the book of Joshua as strictly as the first words of Ezra connect that book with the last verses of Chronicles. According to Josh. xxiv. the people "served Jehovah" during the lifetime of the great conqueror and his contemporaries. In Judg. ii. this statement is repeated, and the writer proceeds to explain that subsequent generations fell away from the faith, and served the gods of the nations among which they dwelt. The worship of other gods is represented, not as something which went on side by side with Jehovah worship (compare x. 6), but as a revolt against Jehovah, periodically repeated and regularly chastised by foreign invasion. The history, therefore, falls into recurring cycles, each of which begins with religious corruption, followed by chastisement, which continues till Jehovah in answer to the groans of His oppressed people raises up a judge to deliver Israel and recall them to the true faith. On the death of the judge, if not sooner, the corruption spreads anew and the same vicissitudes follow. This religious explanation of the course of the history, formally expounded at the outset and repeated in more or less detail from chapter to chapter (most fully in chap. x.), determines the form of the whole narrative, which is grouped round six principal judges, Othniel, Ehud, Deborah, Gideon, Jephthah, and Samson. The intervals between the great judges are filled up by the history of Gideon's son Abimelech and of six minor heroes—Shamgar (following Ehud), Tola and Jair (following Abimelech), Ibzan, Elon, and Abdon (between Jephthah and Samson). The minor judges are not represented as having any immediate religious importance. The cycles of revolt, chastisement, and deliverence are six, not twelve.

To the unity of religious pragmatism in the main stock of the book of Judges corresponds a unity of chronological scheme. The judges, in spite of the fact that most of them had clearly no more than a local influence, are all represented as successive rulers, and the history is dated by the years of each judgeship and those of the intervening periods of oppression. Here, however, a difficulty arises. The fourth year of Solomon is, according to 1 Kings vi. 1, the 480th from the exodus. These 480 years are 12 generations of 40 years each. The larger numbers which make up this total are also mainly reckoned by forties. Moses, Othniel, Ehud, Deborah, Gideon, and the Philistine oppression, in which, according to Judg. xv. 20, Samson's judgeship was but an incident, make up together 7×40 years. Again, David has 40 years, and Samuel (who arose to close the Philistine interregnum twenty years after the death of Eli, and continued in office till he was quite old) cannot have ruled much less than a normal generation. Finally, Joshua, who died at the age of 110, ruled 30 years, if in point of age he was a man of the same standing with Caleb (Josh. xiv. 10). Add to these 30 years 6 for Jephthah and 4 for Solomon and we get 10×40. There remain but 80 years for the elders who outlived Joshua, the interregna or times of oppression previous to the Philistine period, the minor judges, and Saul. But the interregna alone are 71 years, and the minor judges 70, or with Abimelech 73 or 74. It is plain that there is no room for both in the chronological scheme, and the two series correspond so nearly that they must be held to be alternative items in the reckoning, leaving a slightly different length for Saul's brief reign. But as a matter

of fact the minor judges are not so placed in the narrative as to coincide with the periods of oppression. Thus the apparent consecutiveness of the narrative breaks down. The minor judges really lie outside of the chronological scheme of the history as well as of the system of religious cycles: and we infer that even the main stock of the book of Judges is not all constructed by one hand or on a uniform plan.[1]

The religious interpretation of the history corresponds with the prophetic teaching of the 8th century B.C. The use of Baal as a title peculiar to false deities as opposed to Jehovah hardly fits an earlier date than the time of Hosea, and the hostile attitude taken up towards the *ashera* (sacred tree or pole) was not shared by the religious leaders of the period of Jehu. Critics have spoken of chaps. ii. and x. as Deuteronomic, and no doubt the last hand that touched all the earlier historical books and reduced them to unity may be so named; but the main ideas are not necessarily so late, and are rather akin to the non-Levitical Elohist, the author of Josh. xxiv. In particular the worship of the high places is not condemned, nor is it excused as is done in 1 Kings iii. 2.

But the sources of the narrative are obviously much older than the theological exposition of its lessons. The composer of the book has generally transcribed them with little change, so that in reading the story of each great deliverance vouchsafed to Israel we feel ourselves in living contact with the earliest strain of Hebrew patriotism and religion. In this respect the book of Judges is one of the most valuable and interesting in the Old Testament. The song of Deborah and the history of Abimelech carry us back to the beginnings of national life in Israel, when Judah lived outside the main current of the history—the tribe is not even named by Deborah—and when Israelite and Canaanite populations existed side by side and struggled together for supremacy. In these chapters Israel is still in some sense a nation foreign to Canaan, and Jehovah Himself has His seat not on the mountains of Israel, but beyond the fields of Edom on the southern heights of Sinai. The importance of such documents for the scientific historian lies not so much in the events they record as in the unconscious witness they bear to the state of things in which the narrator or poet lived. From this point of view all parts of the book are by no means of equal value, and in some instances, particularly in the histories of Deborah and Gideon, critical analysis appears to show that two narratives of different age have been fused together, the older story giving more prominence to ordinary human motives and combinations, while the later version is colored by religious reflection, and shows the characteristic tendency of the Old Testament to retell the fortunes of Israel in a form that lays ever increasing weight on the work of Jehovah for his people. The history of the minor judges is plainly not related from such lively and detailed reminiscence as gives charm to the longer episodes of the book; and some of the names, as Nöldeke (*op. cit.*) and others have shown, are those of personified families or communities rather than of individuals. This indeed is a characteristic feature of the earlier Hebrew history, which older expositors failed to recognize, but which modern science can no longer ignore.

The third and last part of the book embraces chaps. xvii.–xxi., and consists of two narratives independent of one another and of the main stock of the book, with which they are not brought into any chronological connection. The first narrative, that of Micah and the Danites, belongs to the most primitive strata of the Old Testament history, and is of the highest interest both as a record of the state of religion and for the accurate picture it gives of the way in which one tribe passed from the condition of an invading band into settled possession of land and city. The history of the Levites and the Benjamites is of quite another character, and presupposes a degree of unity of feeling and action among the tribes of Israel which it is not easy to reconcile with the rest of the book. In its present form this episode appears to be not very ancient; it resembles the book of Ruth in giving a good deal of curious archæological detail (the feast at Shiloh) in a form which suggests that the usages referred to were already obsolete when the narrative was composed.

[1] The minor details of the chronology appear not to be derived throughout from tradition, but to be got by subdividing the round number 40. See Wellhausen, *op. cit.*, and Nöldeke, *Untersuchungen*, p. 173 *sq.*

Literature.—On questions of introduction the latest and best investigations are those of Wellhausen in Bleek's *Einleitung*, 4th ed., Berlin, 1878, and in his *Geschichte*, chap. vii. For the historical questions compare also Ewald's *Geschichte*, vol. ii. The most useful modern commentary is that of Studer, Bern, 1835. Later works are those of Bertheau, Leipsic, 1845; Keil, Leipsic, 1863, English translation, 1865; Cassel, in Lange's *Bibelwerk*, Bielefeld, 1865; in the *Speaker's Commentary*; and in Reuss's Bible. On the song of Deborah see Ewald, *Dichter*, i. 1, p. 173; Böttcher, *Alttliche Bühnendichtungen*, Leipsic, 1850; Kemink, *De Carm. Deb.*, Utrecht, 1840; Meier, *Deboralied*, Tübingen, 1859.

(W. R. S.)

JUDGMENT is the last stage in an action, being the definitive order or sentence of the court or judge, enforceable by the appropriate mode of "execution" appointed by law. In English law the writ of execution remains in force only for one year unless renewed, but a writ of execution may be obtained at any time within six years of the judgment, and after six years the application may be made to the court by any person entitled to execution, and execution may issue accordingly. Judgments by courts of an alien jurisdiction are not immediately enforceable as judgments in England, but they constitute a cause of action, and may be sued upon. They are in fact conclusive as between the parties, although objections going to deny the jurisdiction of the court, or showing that the defendant had not been summoned and had never really been before it, would be a good defence. It has lately been held no defence to an action in a foreign judgment that it disclosed on the face of it a manifest misapprehension by the foreign court of a rule of English law.

JUDICATURE, JUDICATURE ACTS. The Judicature Acts are an important series of English statutes having for their object to simplify the system of Judicature in its higher branches. They are the following:—36 & 37 Vict. c. 66; 37 & 38 Vict. c. 83; 38 & 39 Vict. c. 77; 39 & 40 Vict. c. 59 (the Appellate Jurisdiction Act); 40 & 41 Vict. c. 9.

The movement which ended in the Judicature Acts has been promoted by all the recent holders of the office of Lord Chancellor and by most of the leading judges, but it required a long time to bring it to a successful issue, on account of the difficulty always experienced in creating a sufficient amount of public interest in legal reform to overcome the obstacles to legislation. The principal Judicature Act is framed on the basis of a report by a commission which was appointed in 1867. It was carried in the chancellorship of Lord Selborne, but his predecessor Lord Hatherley had in 1870 introduced a measure of the same character. The objects of the Act are threefold—first, to reduce the historically independent courts of common law and equity to one supreme court of judicature, consisting of two branches, a High Court of Justice and a Court of Appeal; secondly, to establish for all divisions of the court a uniform system of pleading and procedure; and, thirdly, to provide for the enforcement of the same rule of law in those cases where chancery and common law had hitherto recognized different rules. The Act does not fuse common law and equity in the sense in which that phrase has generally been employed. The chancery division still remains distinct from the common law division, having a certain range of legal questions under its exclusive control, and possessing to a certain extent a peculiar machinery of its

own for carrying its decrees into execution. But all actions may now be brought in the High Court of Justice, and, subject to such special assignments of business as that alluded to, may be tried in any division thereof; and all divisions must recognize the same principles. Further, the difficulties occasioned by mere technicalities of procedure have been to a great extent removed by a system of pleading, the inspiring principle of which is that each party should state his case in the simplest possible manner. It is in respect of the last point that the operation of the Judicature Act has been least satisfactory, and it is certain that a further simplification of pleading, possibly based on the practice of the Scotch courts, will follow very soon.[1]

The appellate part of the judicature has after some hesitation been finally settled thus. The House of Lords remains the last court of appeal, as before the first Judicature Act. That act abolished the appellate jurisdiction of the Lords so far as the new court of judicature was concerned, leaving it still the appeals from Scotland and Ireland. A temporary Act allowed appeals to be brought from the new court, and the Act 39 & 40 Vict. c. 59 made provisions for the permanent hearing of appeals from all courts to the Lords. The judicial functions of the House of Lords have been virtually transferred to an appeal committee, consisting of the Lord Chancellor and other peers who have held high judicial office, and certain lords of appeal in ordinary created by the Act. No appeal is to be heard unless three of such persons shall be present, and the lords of appeal may sit for the despatch of judicial business during a prorogation of parliament, and even by order of the queen during a dissolution. The lords of appeal in ordinary are an entirely new creation. They hold office on the same conditions as other judges; they take rank as barons for life; but they are entitled to a writ of summons to attend and vote in the House only so long as they hold office, and their dignity does not descend to their heirs. Two are appointed in the first instance, but an arrangement is provided for by which the four head judges of the privy council may ultimately be the four lords of appeal in ordinary. When two of the privy council judges die or resign, a third lord of appeal may be appointed, and a fourth when the remaining two judges of the privy council cease to hold office. The judicial committee of the House of Lords and the judicial committee of the privy council will then be the same, and the two jurisdictions will be fused. The Court of Appeal, created by the Judicature Act of 1873, with intention of making it a final court, is now subject to an appeal to the House of Lords. It now consists of six judges, and sits in two divisions, which, roughly speaking, take respectively the chancery and common law business of the divisional courts, but the lords justices of appeal sit in either division according to convenience. This part of the rearrangement of the judicature may be pronounced entirely successful. A strong and stable court of appeal has been created, instead of the fluctuating tribunal of former times. The same is true generally of the redistribution of judicial strength effected by the Acts, which has led to a marked improvement in the despatch of business.

The Irish Judicature Act (40 & 41 Vict. c. 57) follows the same lines as the English Acts. The pre-existing courts are consolidated into a supreme court of judicature, consisting of a High Court of Justice and a Court of Appeal. The Judicature Acts do not affect Scotch judicature, but the Appellate Jurisdiction Act includes the Court of Session among the courts from which an appeal lies to the House of Lords under the new conditions. (E. R.)

JUDITH, THE BOOK OF, one of the books of the Old Testament APOCRYPHA (*q.v.*), takes its name from the heroine Judith (Ἰουδίθ, Ἰουδήθ, *i.e.*, יְהוּדִית, "Jewess"), to whom the last nine of its sixteen chapters relate. In the Septuagint and Vulgate it immediately precedes Esther, and along with Tobit comes after Nehemiah; in the English Apocrypha it is placed between Tobit and the apocryphal additions to Esther. The argument of the book is briefly as follows. In the twelfth year of his reign Nebuchadnezzar, who is described as king of Assyria, having his capital in Nineveh, makes war against Arphaxad (*i.e.*, the district Arrhapachitis), king of Media, and overcomes him in his seventeenth year. He then despatches his chief general Holofernes to take vengeance on the nations of the west who had withheld their assistance. This expedition has already succeeded in its main objects when Holofernes proceeds to attack Judæa. The children of Israel, who are described as having newly returned from captivity, are apprehensive of a desecration of their sanctuary, and resolve on resistance to the uttermost. The inhabitants of Bethulia (Betylûa) and Betomesthan in particular (neither place can be identified), directed by Joachim the high priest, guard the mountain passes near Dothaim, and place themselves under God's protection. Holofernes now inquires of the chiefs who are with him about the Israelites, and is answered by Achior the leader of the Ammonites, who enters upon a long historical narrative showing the Israelites to be invincible except when they have offended God. For this Achior is punished by being handed over to the Israelites, who lead him to the governor of Bethulia. Next day the siege begins, and after forty days the famished inhabitants urge the governor Ozias to surrender, which he consents to do unless relieved in five days. Judith, a beautiful and pious widow of the tribe of Simeon, now appears on the scene with a plan of deliverance. Wearing her rich attire, and accompanied by her maid, who carries a bag of provisions, she goes over to the hostile camp, where she is at once conducted to the general, whose suspicions are disarmed by the tales she invents. After four days Holofernes, smitten with her charms, at the close of a sumptuous entertainment invites her to remain within his tent over night. No sooner is he overcome with sleep than Judith, seizing his sword, strikes off his head and gives it to her maid; both now leave the camp (as they had previously been accustomed to do, ostensibly for prayer) and return to Bethulia, where the trophy is displayed amid great rejoicings and thanksgivings. Achior now publicly professes Judaism, and at the instance of Judith the Israelites make a sudden onslaught on the enemy, who at once give way, leaving immense spoil in the hands of the victors. Judith now sings a song of praise, and all go up to Jerusalem to worship with sacrifice and rejoicing. The book concludes with a brief notice of the closing years of the heroine, who returned to her native place and lived to the age of one hundred and five years.

Formerly the majority of interpreters were inclined to assign a strictly historical character to the foregoing narrative, although its historical, chronological, and even geographical difficulties were not overlooked; but this view has to a large extent been superseded by that of most recent critics, who, following Buddæus, regard it as a romance written with a patriotic and moral purpose by some imperfectly informed Jew of the Maccabæan period who wished to raise the zeal of his compatriots to the fighting point on behalf of their religion and worship against an overbearing enemy. Volkmar stands alone in treating it as a veiled account of the campaigns of Trajan and his generals against the Parthians and Jews.

According to Origen the book was unknown to the Jews, and did not exist in Hebrew. The extant Greek text, however, which exists in three divergent recensions, shows unmistakable traces of a Hebrew original, even apart from certain expressions which can only be

[1] Pleading, it should be stated, to prevent a possible confusion, means the written statements of complaint and defence made by the parties before the case comes to trial.

explained as ignorant mistranslations. But that original must have differed considerably from the Chaldee text which lay before Jerome, and was used by him for his new Latin version.

The first express reference to Judith occurs in Clement of Rome (1 *Ad Cor.*, cap. 55); it is cited as Scripture by Clement of Alexandria, Tertullian, Ambrose, and Augustine, and was recognized as canonical by the council of Carthage, and by Innocent I. of Rome.

See Schürer, *NTliche Zeitgesch.*, and De Wette-Schrader, *Einleitung;* in both works full bibliographies are given. The most important commentary is that of Fritzsche in the *Exegetisches Handbuch* (1853).

JUDSON, Adoniram (1788–1850), was born at Malden, Massachusetts, August 9, 1788. During his education at Andover Theological seminary he formed the resolution to become a missionary, and in 1812 he was ordained a missionary to Burmah under the auspices of the Congregational Board of Foreign Missions. Having after his arrival in India adopted Baptist views, he was appointed to labor in Burmah by the American Baptist Missionary Union in 1814. His translations of the Bible into Burmese appeared in 1835, and his *Burmese and English Dictionary* in 1852. He died April 12, 1850. Both in his literary and his missionary labors he was greatly assisted by the three ladies whom he successively married, of whom as well as of Judson biographies have been published.

JUGURTHA. After the final conquest of Carthage by the Romans in 146 B.C., the larger part of the north of Africa was practically under Roman control. The so-called province, indeed, of Africa, as then constituted, was but a small strip of territory, comprising the possessions retained by Carthage during the few years previous to her downfall. It coincided with the northeastern portion of Tunis. Around it, to the west, south, and east, was the region to which the Romans gave the name of Numidia, the country of the "Nomads," which stretched westwards to Mauretania, the river Malucha (Malúwi), which flows into the gulf of Melillah, being here roughly its boundary, and eastwards to the Great Syrtis, thus bordering on Cyrene and Egypt. We may say that Numidia corresponds with what is now Algiers, the south of Tunis, and Tripoli, including in addition a region of indefinite extent to the south. Over this extensive territory, parts of which were rich and populous, Masinissa had ruled for many years, and had rendered Rome substantial aid in her war with Carthage. On his death in 149 B.C. his sovereign power was divided under the direction of Scipio Africanus the younger, the conqueror of Carthage, between his three sons Micipsa, Gulussa, and Mastanabal. The actual government, however, was chiefly in the hands of an illegitimate son of Mastanabal, Jugurtha. The Numidian princes were by no means mere barbarous chiefs. Micipsa, though too weak to be a king, is said to have been imbued with a considerable tincture of Greek philosophy, and Jugurtha's father too was a man of some literary culture. Jugurtha himself had many of the qualities which command success. He was strong and active; he had a handsome face and keen intelligence; he was a skilful rider, and was a thorough adept in all warlike exercises. In fact, he was in many respects a very worthy grandson of Masinissa, and he inherited much of his political ability and adroitness. Micipsa was naturally rather afraid of him, and knowing his military tastes, he sent him to Spain in command of a Numidian force, to serve under Scipio, who was then engaged in the war with Numantia. Jugurtha soon won Scipio's good opinion, and he became a favorite with the Roman nobles serving in the camp, some of whom put into his head the idea of making himself the sole king of Numidia, hinting that at Rome anything could be done for money. There was truth in the hint, as subsequent events proved.

In 118 B.C. Micipsa died. He had thought it politic to adopt Jugurtha, and to provide by his will that he should be associated with his own two sons, Adherbal and Hiempsal, in the government of Numidia. Scipio had written to Micipsa a strong letter of recommendation in favor of Jugurtha; and to Scipio, accordingly, Micipsa entrusted the execution of his will. His testamentary arrangements thus had the Roman guarantee, but they utterly failed. The princes soon quarrelled; and Jugurtha, who was thoroughly unscrupulous, claimed the entire kingdom. His cousin Hiempsal he contrived to have assassinated; and Adherbal he quickly drove out of Numidia by force of arms, compelling him to take refuge in the Roman province of Africa. He had next the audacity to send envoys to Rome to defend his usurpation. Hiempsal, they were to say, had been murdered by his subjects for his cruelty, and Adherbal, who was now at Rome to get redress, had been himself the aggressor. The senate decided that Numidia was to be divided between the two princes, and the division, which was arranged under the superintendence of Roman commissioners, gave the western, the richest and most populous half of the country, to Jugurtha, while the sands and deserts of the eastern half were left to Adherbal. Jugurtha's envoys appear to have found several of the Roman nobles and senators accessible to judicious bribery. So far, however, was he from being satisfied with having secured the best of the bargain that he at once began to molest Adherbal's dominions and to provoke him to a war of self-defence. He so completely defeated him, somewhere near, it would seem, the modern Philippeville, that Adherbal sought safety in Cirta (Constantina), the chief town of Numidia, and a very strong fortress. Here he was besieged by Jugurtha, who, notwithstanding the interposition of a Roman embassy headed by Marcus Scaurus, a leading Roman senator, ultimately forced the place to capitulate, and then treacherously massacred all the inhabitants, his cousin Adherbal among them, and a number of Italian merchants who had settled in the town. There was great wrath at Rome and throughout all Italy; and the senate, a majority of which still clung to Jugurtha in spite of the proof they had just had of his atrocious treachery and cruelty, were persuaded in the same year, 111 B.C., on the motion of the tribune Caius Memmius, to allow a declaration of war against the Numidians. An army was despatched to Africa under the command of the newly elected consul, Calpurnius Bestia, and several of the Numidian towns voluntarily surrendered, while Bocchus, the king of Mauretania, and Jugurtha's father-in-law, offered the Romans his alliance. Jugurtha was alarmed, but, having plenty of money at his command out of the accumulated treasures of his grandfather Masinissa, he again acted on his experience of Roman venality, and he was successful in arranging for himself with the Roman general a peace which left him in undisturbed possession of the whole of Numidia. When the facts were known at Rome, the tribune Memmius insisted that Jugurtha should appear in person and be questioned as to the precise nature of the negotiations. Jugurtha indeed appeared under a safe conduct, but he had partisans who took care that his mouth should be closed. The treaty, however, was set aside, and war was again declared, Spurius Albinus, the new consul, having the command. The Roman army in Africa was thoroughly demoralized and quite unfit to take the field. An unsuccessful attempt was made on a fortified town, Suthul, in which the royal treasures were deposited. Worse followed: the army was surprised by the enemy in a night attack, and the camp was taken and plundered. Jugurtha was master of the situation, and every Roman was driven out of Numidia.

By this time the feeling at Rome and in Italy against the corruption and incapacity of the nobles had become so strong that prosecutions on a wholesale scale

struck down a number of the senators, and Bestia and Albinus were sentenced to exile. The Numidian war was now entrusted to Quintus Metellus, an aristocrat indeed in sentiment, but at the same time an able soldier and a stern disciplinarian. With him was associated the famous Caius Marius, who had risen from the rank of a centurion. The army was soon in a condition to face the enemy, and from the year 109 B.C. to the close of the war in 106 the contest was carried on with credit to the Roman arms. Jugurtha was defeated in an action on the river Muthal, after an obstinate resistance and a display of much military skill. Once again he even succeeded in surprising the Roman camp and forcing Metellus into winter quarters. There were fresh negotiations, but Metellus insisted on the surrender of the king's person, and this Jugurtha refused. Numidia on the whole seemed disposed to assert its independence, and Rome had before her an indefinite prospect of a long and troublesome guerilla war. The country was a particularly trying one for a regular army, and a victory seemed to lead to no substantial result. Nothing could be really accomplished unless Jugurtha himself could be secured; and to this end negotiations, reflecting little credit on the Romans, were set on foot with Bocchus, who for a time, as his interest seemed to dictate, played fast and loose with both parties. The war dragged on till in 106 B.C. Marius was called on by the vote of the Roman people to supersede Metellus. Marius found that he had a difficult work, and his army was once seriously imperilled on the borders of Mauretania, whither he had led them to overawe Bocchus, who had just made a friendly treaty with Jugurtha. Shortly afterwards this cunning and treacherous prince again offered his friendship to the Romans, and it was through his perfidy and not by Roman skill or valor that the war with Jugurtha was ended. In the final negotiations Lucius Sulla, who was Marius's quæstor and commanded the cavalry, had the honor, such as it was, of winning over to the Roman side the king of Mauretania, and prevailing on him to sacrifice Jugurtha. The Numidian fell into an ambush through his father-in-law's treachery, and was conveyed a prisoner to Rome. Two years afterwards, in 104 B.C., he figured with his two sons in Marius's triumph, and in the subterranean prison beneath the Capitol, "the bath of ice," as he called it, he was either strangled or starved to death. The war had been an inglorious one for Rome, and its end, with all its attendant circumstances, was deplorably disgraceful.

Jugurtha, though doubtless for a time regarded by his African and Numidian countrymen as their deliverer from the yoke of Rome, mainly owes his historical importance to the very full and minute account of him which we have from the hand of Sallust, himself afterwards governor of Numidia. The Jugurthine war too happened to coincide with a period of considerable political interest at Rome. The symptoms of revolution were beginning to make themselves visible. The weakness and corruption of the government of the senate was forcing itself on the notice of all men, and popular opinion was becoming too strong to be disregarded. One general after another had been superseded and disgraced, and Marius, a man of the humblest origin, had been summoned by the public voice to put an end to a war in which the incapacity and disloyalty of consuls and senators had been grievously exposed. The names of both Marius and Sulla became famous for the first time in a struggle with a Numidian chief. The time was clearly at hand when the old system of Rome's government could sustain itself no longer.

The best modern account of Jugurtha and the Jugurthine war is to be found in Mommsen, *Hist. of Rome*, book iv. chap. v. (W. J. B.)

JUJUBE. Under this name the fruits of at least two species of *Zizyphus* are usually described, namely, *Z. vulgaris* of Lamark and *Z. Jujuba* of the same author. The species of *Zizyphus* are for the most part small trees or shrubs, armed with sharp, straight, or hooked spines, having alternate leaves and fruits, which are in most of the species edible, and have an agreeable acid taste; this is especially the case with those of the two species mentioned above.

Z. vulgaris is a tree about 20 feet high, extensively cultivated in many parts of southern Europe, Asia, Spain, the south of France, and Italy, also in western Asia, China, and Japan. In India it extends from the Punjab to the western frontier, ascending in the Punjab Himalaya to a height of 6500 feet, and is found both in the wild and cultivated state. The plant is grown almost exclusively for the sake of its fruit, which both in size and shape resembles a moderate sized plum; at first the fruits are green, but as they ripen they become of a reddish-brown color on the outside and yellow within. They ripen in September, when they are gathered and preserved by storing in a dry place: after a time the pulp becomes much softer and sweeter than when fresh. Jujube fruits when carefully dried will keep for a long time, and retain their agreeable refreshing acid flavor, on account of which they are much valued in the countries of the Mediterranean region as a winter dessert fruit; and, besides, they are nutritive and demulcent. At one time a decoction was prepared from them and recommended in pectoral complaints. A kind of thick paste, known as jujube paste, was also made of a composition of gum arabic and sugar dissolved in a decoction of jujube fruit evaporated to the proper consistency. The fruits of the *Zizyphus* do not enter into the composition of the lozenges now known as jujubes.

The second species of *Zizyphus* referred to above, viz., *Z. Jujuba*, is a tree averaging from 30 to 50 feet high, found both wild and cultivated in many parts of the tropics, as in China, Australia, the Malay archipelago, Ceylon, throughout India, and in tropical Africa. Many varieties of this tree are known to and cultivated by the Chinese, who distinguish them by the shape and size of their fruits, which are produced in abundance, and are not only much valued as dessert fruit in China, but are also occasionally exported to England.

As seen in commerce jujube fruits are about the size of a small filbert, having a reddish-brown, shining, somewhat wrinkled exterior, and a yellow or gingerbread-colored pulp enclosing a hard elongated stone.

JUKES, Joseph Beete (1811–1869), geologist, was born near Birmingham, October 10, 1811. Educated first at Wolverhampton grammar-school and afterwards at King Edward's School, Birmingham, he passed in 1830 to St. John's College, Cambridge, where he graduated in 1836. At Cambridge he began the study of geology under Sedgwick, and in 1839, after three years of study, lecturing and writing, he was appointed geological surveyor of Newfoundland. He returned to England at the end of 1840, and in April, 1842, sailed as naturalist on board H.M.S. "Fly," despatched to survey Torres Strait, New Guinea, and the east coast of Australia. Jukes landed in England again in June, 1846, and in August received an appointment to the geological survey of Great Britain. The district to which he was sent was North Wales. In 1850 he accepted the post of local director of the geological survey of Ireland. The exhausting nature of his work slowly but surely wore out even his robust constitution, and on July 29, 1869, he died. Immediately on leaving college, Jukes became a member of the London Geological Society, and in 1852 he was admitted to the Dublin Geological Society, of which he was president in 1853 and 1854. He was also a Fellow of the Royal Society. For many years he lectured as professor of geology, first at the Royal Dublin Society's Museum of Irish Industry, and afterwards at the Royal College of Science in Dublin.

In addition to the reports of his various appointments, Jukes wrote very many papers and memoirs, to be found

in the London and Dublin geological journals and other periodicals. While in Ireland he edited, and in great measure wrote, forty-two memoirs explanatory of the maps of the south, east, and west of Ireland, and prepared a geological map of Ireland on a scale of 8 miles to an inch. He was also the author of *Excursions in and about Newfoundland*, 2 vols., 1842; *Narrative of the Surveying Voyage of H.M S. "Fly,"* 2 vols., 1847; *A Sketch of the Physical Structure of Australia*, 1848; *Popular Physical Geology*, 1853; *On the Geology of Australia*, 1853; *Student's Manual of Geology*, 1857 (later editions, 1862, 1872); the article GEOLOGY, in the 8th edition of the *Encyclopædia Britannica*, 1858; and *School Manual of Geology*, 1863. See *Letters, etc., of J. Beete Jukes, edited with connecting memorial notes by his sister* (C. A. Browne), 1871, to which is added a chronological list of Jukes's writings.

JULIAN (331–363), commonly called Julian the Apostate, was Roman emperor for about a year and eight months (361–363). His full name was Flavius Claudius Julianus. He was born at Constantinople in 331, being the son of Julius Constantius and his wife Basilina, and nephew of Constantine the Great. He was thus a member of the dynasty under whose auspices Christianity became the established religion of Rome.

Julian lost his mother not many months after he was born. He was only six when his imperial uncle Constantine died; and one of his earliest memories must have been the fearful massacre of his father and kinsfolk, in the interest and more or less at the instigation of the sons of Constantine. Only Julian and his elder brother Gallus were spared, as they were too young to excite the fear or justify the cruelty of the murderers. From this period till his twenty-fifth year Julian passed his life in the closest retirement, jealously watched by the reigning emperor, often under immediate fear of death. He was carefully educated, however, under the supervision of the family eunuch Mardonius, and of Eusebius, bishop of Nicomedia, at Constantinople itself and at various places in Ionia and Bithynia, and afterwards for six years at Macellum, a remote and lonely castle in Cappadocia. He was trained to the profession of the Christian religion; but he became early attracted to the old faith, or rather to the idealized amalgam of paganism and philosophy which was current among his teachers, the rhetoricians. Cut off from all sympathy with the reigning belief by the terrible fate of his family, and with no prospect of a public career, he turned with all the eagerness of an enthusiastic temperament to the literary and philosophic studies of the time. The old Hellenic world had an irresistible attraction for him. Love for its culture was in Julian's mind intimately associated with loyalty to its religion.

In the meantime the course of events had left as sole autocrat of the Roman empire his cousin Constantius, who felt himself unequal to the enormous task, and called Julian's brother Gallus to a share of power. The same turn of affairs brought a great improvement in the condition of Julian, who was permitted to pursue his studies at Nicomedia. Here he made the acquaintance of some of the most eminent rhetoricians of the time, and here it was that he became confirmed in his secret devotion to the pagan faith. But the downfall of Gallus (354) yet again exposed Julian to the greatest danger. By his rash and headstrong conduct Gallus had incurred the enmity of Constantius and the eunuchs, his confidential ministers, and was put to death. Julian fell under a like suspicion, and narrowly escaped the same fate. For some months he was confined at Milan, till at the intercession of the empress Eusebia, who always had a kindness for him, he was permitted to retire to Athens (355). The few months he spent here were probably the happiest of his life. Living at the ancient hearth of Grecian culture, and amid the companionship of congenial friends, he found his dearest ambition realized in the enthusiastic study of literature and philosophy.

But a member of the Roman imperial house could not thus be allowed to escape the public responsibilities connected with his birth. The emperor Constantius and he were now the sole surviving male members of the family of Constantine; and, as the emperor again felt himself oppressed by the cares of government, there was no alternative but to call Julian to his assistance. At the instance of the empress he was summoned to Milan; and there from Constantius, who had been chiefly concerned in the murder of his family, he received the hand of Helena, sister of the emperor, as also the title of Cæsar and the government of Gaul. It was with extreme reluctance that Julian entered on his new dignities. Accustomed to a life of quiet study and retirement, he felt timid and awkward in the world of ceremony, suspicion, and intrigue to which he was now introduced. He knew well the danger to which he was exposed from the dark temper of the emperor and the arts of the eunuchs, who were all-powerful at the court.

A task of extreme difficulty also awaited him beyond the Alps. During recent troubles the Alemanni and other German tribes had crossed the Rhine; they had burned Cologne, Treves, Strasburg, and many other flourishing cities, and extended their ravages far into the interior of Gaul. The internal government of the province had also fallen into great confusion. In spite of his inexperience, and by virtue of his native energy and ability, Julian quickly brought affairs into order. He completely overthrew the Alemanni in the great battle of Strasburg (357). The Frankish tribes which had settled on the western bank of the lower Rhine were reduced to submission. Five times in all he crossed the river to overawe the restless tribes beyond. In Gaul he rebuilt the cities which had been laid waste, re-established the administration on a just and secure footing, and as far as possible lightened the taxes, which weighed so heavily on the poor provincials. Paris was the usual residence of Julian during his government of Gaul, and his name has become inseparably associated with the early history of the city.

The position and reputation of Julian were now established. He was general of a victorious army enthusiastically attached to him, and governor of a province which he had saved from ruin; but he had also become an object of fear and jealousy at the imperial court. It was accordingly resolved to weaken his power. A threatened invasion of the Persians was made an excuse for withdrawing some of the best legions from the Gallic army. Julian recognized the covert purpose of this, yet proceeded to fulfil the commands of the emperor. A sudden movement of the legions themselves decided otherwise. At Paris, on the night of the parting banquet, they forced their way into Julian's tent, and, proclaiming him emperor, offered him the alternative either of accepting the lofty title or of instant death. Julian accepted the empire, and sent an embassy with a deferential message to Constantius. The message being contemptuously disregarded, both sides prepared for a decisive struggle. After a march of unexampled rapidity through the Black Forest and down the Danube, Julian reached Sirmium, and was on the way to Constantinople, when he received news of the death of Constantius at Mompsocrene in Cilicia (361). Without further trouble Julian found himself everywhere acknowledged the sole ruler of the Roman empire.

Julian had already made a public avowal of paganism, of which he had been a secret adherent from the age of twenty. It was no ordinary profession, but the expression of a strong and even enthusiastic conviction; the restoration of the pagan worship was to be the great aim and controlling principle of his government. His reign was too short to show what precise form the pagan revival might ultimately have taken, how far his feelings might have become embittered by his conflict with the Christian faith, whether persecution, violence, and civil war might not have taken the place of the moral suasion which was the method he originally affected. He issued an edict of universal toleration; but in many respects he used his imperial

influence unfairly to advance the work of restoration. In order to deprive the Christians of the advantages of culture, and discredit them as an ignorant sect, he forbade them to teach rhetoric. The symbols of paganism and of the imperial dignity were so artfully interwoven on the standards of the legions that they could not pay the usual homage to the emperor without seeming to offer worship to the gods; and, when the soldiers came forward to receive the customary donative, they were required to throw a handful of incense on the altar. Without directly excluding Christians from the high offices of state, he held that the worshippers of the gods ought to have the preference. In short, though there was no direct persecution, he exerted much more than a moral pressure to restore the power and prestige of the old faith.

Having spent the winter of 361–2 at Constantinople, Julian proceeded to Antioch to prepare for his great expedition against Persia. His stay there was a curious episode in his life. Strange to say, it is doubtful whether his pagan convictions or his ascetic life, after the fashion of an antique philosopher, gave most offence to the so-called Christians of the dissolute city. They soon grew heartily tired of each other, and Julian took up his winter quarters at Tarsus, from which in early spring he marched against Persia. At the head of a powerful and well-appointed army he advanced through Mesopotamia and Assyria as far as Ctesiphon, near which he crossed the Tigris, in face of a Persian army, which he defeated. Misled by the treacherous advice of a Persian nobleman, he desisted from the siege of that great city, and set out to seek the main army of the enemy under King Sapor. After a long and useless march into the interior he was forced to retreat, when he found himself enveloped and harassed by the whole Persian army, in a waterless and desolate country, and at the hottest season of the year. The Romans repulsed the enemy in many an obstinate battle. In one of these, however, on the 26th of June, 363, Julian, who was ever in the front, was mortally wounded. The same night he died in his tent. In the most authentic historian of his reign, Ammianus Marcellinus, we find a noble speech, which, like Socrates in the prison, he is said to have addressed to his afflicted officers. Jovianus was chosen emperor by the army, which was extricated from its perilous situation only by a very disadvantageous treaty.

From Julian's unique position as the last champion of a dying polytheism, his character has ever excited interest and been the subject of debate. Authors such as Gregory of Nazianzus have heaped the fiercest anathemas upon him; but a just and sympathetic criticism, like Neander's, has found many noble qualities in his character and ample excuse for his leanings to a philosophic paganism. In his childhood he had seen his nearest kinsmen massacred by the heads of the new Christian state; till the age of twenty-five he held his life on sufferance, and passed it in obscurity under the most rigid and suspicious surveillance. The only sympathetic friends he met were among the heathen rhetoricians and philosophers; and he found a suitable outlet for his restless and inquiring mind only in the studies of ancient Greece. In this way he was attracted to the old paganism; but it was a paganism idealized by the philosophy of the time, and still further purified by the moral influence of the Christianity which it rejected.

In other respects Julian was no unworthy successor of the Antonines. Though brought up in a studious and pedantic solitude, he was no sooner called to the government of Gaul than he displayed all the energy, the hardihood, and the practical sagacity of an old Roman. In temperance, self-control, and zeal for the public good, as he understood it, he was unsurpassed. To these Roman qualities he added the culture, literary instincts, and speculative curiosity of a Greek. One of the most remarkable features of his public life was the perfect ease and mastery with which he associated the cares of war and statesmanship with the assiduous cultivation of literature and philosophy. Yet even his devotion to culture was not free from pedantry and dilettantism. His contemporaries observed in him a want of naturalness. He had not the moral health or the composed and reticent manhood of a Roman, or the un-self-conscious spontaneity of a Greek. He could never be at rest; he never could hold his tongue; in the rapid torrent of his conversation he was apt to run himself out of breath; his manner was jerky and spasmodic. He showed quite a deferential regard for the sophists and rhetoricians of the time, and advanced them to high offices of state; there was real cause for fear that he would introduce the government of pedants in the Roman empire. Last of all, his love for the old philosophy was sadly disfigured by his devotion to the old superstitions, and in this respect he little pleased the taste of a judge like Gibbon. He was greatly given to divination; he was noted for the number of his sacrificial victims. Wits applied to him the joke that had been passed on Marcus Aurelius: "The white cattle to Marcus Cæsar, greeting. If you conquer, there is an end of us."

Julian wrote several works, including—(1) *Letters*, eighty-three of which are preserved in the edition of Heyler, Mainz, 1828 (most of these are addressed to men of letters); (2) *Orations*, nine in number; (3) Καίσαρες ἢ Συμπόσιον, a satirical composition, in which the dead Cæsars appear at a banquet prepared in the heavens, and have to endure the caustic wit of old Silenus; (4) Ἀντιοχικὸς ἢ Μισοπώγων, a *jeu d'esprit* on the inhabitants of Antioch, in which also his own person and mode of life are jocularly handled. The most important of his works, the Κατὰ Χριστιανῶν, has been lost, except the fragments preserved in the refutation by Cyril, latest edition by Neumann, 1881. The best edition of his entire works used to be that of Spanheim, Leipsic, 1696; the most recent is that of Hertlein in the Teubner series, Leipsic, vol. i., in 1875.

Of the primary sources for Julian's life and character the most important are his own works; the trustworthy and impartial historian of the period, Ammianus Marcellinus, v. 8–xxv.; the letters and orations of Julian's much-esteemed friend Libanius; and the orations of his severest critic, Gregory, of Nazianzus. The impression which Julian's career produced on the Christians of the East is reflected in two Syriac romances published by J. G. E. Hoffmann (*Julianos der Abtrünnige*, Leyden, 1880). Compare Nöldeke, in *Z. D. M. G.*, 1874, vol. xxviii., p. 263 *sq.*, 666 *sq.* Modern authorities are—Gibbon's *Decline and Fall;* Neander, *Der Kaiser Julian und sein Zeitalter*, Leipsic, 1813, English translation by G. V. Cox; D. F. Strauss, *Der Romantiker auf dem Throne der Cäsaren oder Julian der Abtrünnige* (*Gesam. Schriften*, vol. i., Bonn., 1876); Semisch, *Julian der Abtrünnige;* Rode, *Geschichte der Reaction K. Julians gegen die christliche Kirche;* H. Adrien Naville, *Julien l'Apostat*, Paris, 1877; and the Hulsean essay for 1876, by G. H. Rendall. (T. K.)

JÜLICH (Fr., *Juliers*), the chief town of a circle in the government district of Aachen, Prussia, and capital of the former duchy of Jülich, situated on the right bank of the Roer, about 16 miles northeast of Aachen (Aix-la-Chapelle). It contains three churches, a progymnasium, and a military school, and has manufactures of leather, paper, and wood. The population in 1905 was 6,009.

Jülich (formerly also Gülch, Guliche) is the Juliacum of the *Antonini Itinerarium;* some have attributed its origin to Julius Cæsar. From the 9th century it appears several times in history, generally as the scene of siege. From 1794 till 1815 it was in the hands of the French. Till 1860, when its works were demolished, Jülich ranked as a fortress of the second class.

JULIEN, Noel (1797–1873), afterwards called Stanislas-Aignan Julien, was born at Orleans April 13, 1797. His father, who was a mechanic, being desirous of improving the position of his son, destined the young Stanislas-Aignan for the priesthood, and in preparation for that calling sent him to the seminary in his native town. Here his extraordinary talent for the acquisition of languages first displayed itself, and with his knowledge increased his repugnance to the profession marked out for him. His favorite study at this time was Greek literature, and so recognized did his scholarship become that, when he went to Paris in 1821, he received the ap-

pointment of assistant professor of Greek at the Collége de France. In the same year he published a translation of the Ἑλένης ἁρπαγή of Coluthus, of which work he subsequently brought out a new edition, with a Latin version and notes. In later years he was in the habit of saying that it was as the author of this work that he would be best known by posterity,—another instance of the common inability of authors to judge correctly of the relative merits of their works. At this period his attention was drawn to the lectures being delivered by Abel Rémusat on the Chinese language, and being attracted to the study he placed himself under the tuition of that professor. In this new pursuit his progress was as marked and as rapid as formerly in Greek. From the first he, as if by intuition, thoroughly mastered the genius of the language; and the complexity of the characters and the peculiarities of construction, which to others have always presented serious difficulties, at once yielded to his ability and diligence. In 1823 he published a translation in Latin of a part of the works of Mencius, one of the nine classical books of the Chinese, and, though this volume appeared within two years of his having taken up the study of the language, it justified its publication by its success. A year later he produced a translation of the modern Greek odes of Kalvos under the title of *La Lyre patriotique de la Grèce*. But such works were not profitable in a commercial sense, and, being without any patrimony, Julien was glad to accept the assistance of Sir William Drummond and others, until in 1827 he was appointed sub-librarian to the French Institute. In 1831 he was elected a member of L'Académie des Inscriptions et Belles-Lettres de l'Institut de France in the place of Saint-Martin, and in the following year he succeeded Rémusat as professor of Chinese at the Collége de France. For some years his studies had been directed towards the dramatic and lighter literature of the Chinese, and in rapid succession he now brought out translations of the *Hoei-lan-ki*, or "L'histoire du cercle de craie," a drama in which occurs a curiously analogous scene to the judgment of Solomon; the *Pih shay tsing ki; Blanche et Bleue, ou les deux couleuvres fées;* and the *Tchao-chi kou eul*, upon which Voltaire subsequently founded his *Orphelin de la Chine*. With the versatility which belonged to his genius, he next turned, apparently without difficulty, to the very different style common to Taouist writings, and translated in 1835, for the Oriental Translation Fund, *Le Livre des Récompenses et des Peines* of Laou-tsze. About this time the cultivation of silk-worms was beginning to attract attention in France, and by order of the minister of agriculture Julien compiled, in 1837, a *Résumé des principaux traités Chinois sur la culture des mûriers, et l'éducation des vers-à-soie*, which was speedily translated into English, German, Italian, and Russian.

Nothing was more characteristic of his method of studying Chinese than his habit of collecting every peculiarity of idiom and expression which he met with in his reading; and, in order that others might reap the benefit of his experiences, he published in 1841 a work entitled *Discussions grammaticales sur certaines règles de position qui, en Chinois, jouent la même rôle que les inflexions dans les autres langues*, which he followed in 1842 by *Exercises pratiques d'analyse, de syntaxe, et de lexigraphie Chinoise*. Meanwhile in 1839 he had been appointed joint keeper of the Bibliothèque Royal, with the especial superintendence of the Chinese books, and shortly afterwards he was made Administrateur du Collége de France.

The facility with which he had learned Chinese, and the success which his proficiency commanded, naturally inclined other less gifted scholars to resent the impatience with which he regarded the mistakes into which they fell in their translations from this most difficult language, and at different times bitter controversies arose between Julien and his fellow Sinologues on the one subject which they had in common. How envenomed were the disputes which thus arose may be gathered from the following title of a work published in 1842 by Julien, *Simple exposé d'un fait honorable odieusement dénaturé dans un libelle récent de M. Pauthier, suivi de la réfutation de sa dernière réponse, du résumé analytique de plus de 600 fautes qu'il n'a pas su justifier, et de l'examen de certains passages à l'aide desquels il a prétendu prouver que des Égyptiens ont porté en Chine l'invention de l'écriture 2353 ans avant J. C.* In the same year appeared from his busy pen a translation of the *Tao te King*, the celebrated work in which Laou-tsze attempted to explain his idea of the relation existing between the universe and something which he called *Taou*, and on which the religion of Taouism is based. From Taouism to Buddhism was a natural transition, and about this time Julien turned his attention to the Buddhist literature of China, and more especially to the travels of Buddhist pilgrims to India. In order that he might better understand the references to Indian institutions, and the transcriptions in Chinese of Sanskrit words and proper names, he began the study of Sanskrit, and in 1853 brought out his *Voyages des Pèlerins Bouddhistes*, the value of which work is much enhanced by the fruits of this new instance of his extraordinary mental enterprise. The same remark applies to the work which he published six years later entitled *Les Avadânas, contes et apologues Indiens inconnus jusqu'à ce jour, suivis de poésies et de nouvelles Chinoises*. For the benefit of future students he disclosed his system of deciphering Sanskrit words occurring in Chinese books in his *Méthode pour déchiffrer et transcrire les noms Sanscrits qui se rencontrent dans les livres Chinois* (1861). This work, which contains much of interest and importance, falls short of the value which its author was accustomed to attach to it. It had escaped his observation that, since the translations of Sanskrit works into Chinese were undertaken in different parts of the empire, the same Sanskrit words were of necessity differently represented in Chinese characters in accordance with the dialectical variations. No hard and fast rule can therefore possibly be laid down for the decipherment of Chinese transcriptions of Sanskrit words, and the effect of this impossibility was felt though not recognized by Julien, who in order to make good his rule was occasionally obliged to suppose that wrong characters had by mistake been introduced into the texts. His Indian studies led to a controversy with M. Reinaud, which was certainly not free from the gall of bitterness. Among the many subjects to which he turned his attention were the native industries of China, and his work on the *Histoire et fabrication de la porcelaine Chinoise* is still, and is likely to remain, a standard work on the subject. In another volume he also published an account of the *Industries anciennes et modernes de l'empire Chinois* (1869), translated from native authorities. In the intervals of more serious undertakings he translated the *San tseu King*, or "Le Livre des trois mots;" *Thsien tseu wen*, or "Le Livre de mille mots;" "Les deux cousines;" "Nouvelles Chinoises;" the *Ping chan ling yen*, "Les deux jeunes filles lettrées;" and the "Dialoghi Cinesi," *Ji-teh'ang k'eou-t'eou-koa*. The last work of importance which proceeded from his pen was his *Syntaxe nouvelle de la langue Chinoise* (1869). In these volumes he gives the results of his study of the language, and has collected in them a vast array of facts and of idiomatic expressions. A more scientific arrangement and treatment of his subject would have added much to the value of this work, which, however, contains a mine of material which amply repays exploration. One great secret by which Julien acquired his grasp of the Chinese language was, as we have said, his methodical collection of phrases and idiomatic expressions. Whenever in the course of his reading he met with a new phrase or expression,

he entered it on a card, which took its place in regular order in a long series of boxes. At his death, which took place on the 20th February, 1873, he left, it is said, 250,000 of such cards, about the fate of which, however, little seems to be known. In politics Julien was imperialist, and in 1863 he was made a commander of the legion of honor in recognition of the services he had rendered to literature during the empire.

(R. K. D.)

JULIERS. See JÜLICH.

JULIUS I., pope from 337 to 352, was a native of Rome, and was chosen as successor of Marcus after the Roman see had been vacant four months. He is chiefly known by the part which he took in the Arian controversy. After the Eusebians had, at a synod held in Antioch in 341, renewed their deposition of Athanasius, they resolved to send delegates to Constans, emperor of the West, and also to Julius, setting forth the grounds on which they had proceeded. The latter, after expressing an opinion favorable to Athanasius, adroitly invited both parties to lay the case before a synod to be presided over by himself. This proposal, however, the Eastern bishops declined to accept. On his second banishment from Alexandria, Athanasius came to Rome, and was recognized as a regular bishop by the synod held in 342. It was through the influence of Julius that, at a later date, the council of Sardica in Illyria was held, which was attended only by seventy-six Eastern bishops, who speedily withdrew to Philippopolis and deposed Julius, along with Athanasius and others. The three hundred Western bishops who remained confirmed the previous decisions of the Roman synod; and by its 3d, 4th and 5th decrees relating to the rights of revision claimed by Julius the council of Sardica perceptibly helped forward the pretensions of the papacy. Julius on his death in April, 352, was succeeded by Tiberius.

JULIUS II., pope from 1503 to 1513, was born at Savona in 1443. He was the son of a brother of Sixtus IV., his original name being Giuliano della Rovere. By his uncle, who took him under his special charge, he was educated among the Franciscans, and latterly sent to a convent in La Pérouse with the special purpose of obtaining a knowledge of the sciences. He does not appear, however, to have joined the order of St. Francis, but to have remained one of the secular clergy until his elevation in 1471 to be bishop of Carpentras, shortly after his uncle succeeded to the papal chair. In the same year he was promoted to be cardinal, taking the same title as that formerly held by his uncle, St. Peter ad Vincula. With his uncle he obtained very great influence, and in addition to the archbishopric of Avignon he held no fewer than eight bishoprics. In the capacity of papal legate he was sent in 1480 to France, where he remained four years, and acquitted himself with such ability that he soon acquired a paramount influence in the college of cardinals, an influence which rather increased than diminished during the pontificate of Innocent VIII. A rivalry had, however, gradually grown up between him and Roderigo Borgia, and on the death of Innocent in 1492 Borgia by means of a secret agreement with Ascanio Sforza succeeded in being elected over Della Rovere by a large majority, under the name of Alexander VI. Della Rovere at once determined to take refuge at Ostia, and in a few months afterwards went to Paris, where he incited Charles VIII. to undertake the conquest of Naples. Accompanying the young king on his campaign, he entered Rome along with him, and endeavored to instigate the convocation of a council to inquire into the conduct of the pope with a view to his deposition, but Alexander, having gained a friend in Charles's minister Briçonnet, by the offer of a cardinal's hat, succeeded in counterworking the machinations of his enemy. On the death of Alexander in 1503 Della Rovere supported the candidature of Cardinal Piccolomini of Milan, who was consecrated under the name of Pius III., but was then suffering from an incurable malady, of which he died in little more than a month afterwards. Della Rovere then succeeded by dexterous diplomacy in winning the support of Cæsar Borgia, and was elected to the papal dignity by the unanimous vote of the cardinals. From the beginning Julius II. set himself with a courage and determination rarely equalled to rid himself of the various powers under which his temporal authority was almost overwhelmed. By a series of complicated stratagems he first succeeded in rendering it impossible for Borgia to remain in the papal states. He then used his influence to reconcile the two powerful houses of Orsini and Colonna, and, by decrees made in their interest, he also attached to himself the remainder of the nobility. Being thus secure in Rome and the surrounding country, he next set himself to oust the Venetians from Faenza, Rimini, and the other towns and fortresses of Italy which they occupied at the death of Alexander VI. Finding it impossible to succeed with the doge by remonstrance, he in 1504 brought about a union of the conflicting interests of France and Germany, and sacrificed temporarily to some extent the independence of Italy in order to conclude with them an offensive and defensive alliance against Venice. The combination was, however, at first little more than nominal, and was not immediately effective in compelling the Venetians to deliver up more than a few unimportant places in the Romagna; but by a brilliant campaign Julius in 1506 succeeded in freeing Perugia and Bologna from their despots, and raised himself to such a height of influence as to render his friendship of prime importance both to the king of France and the emperor. Events also in other respects so favored his plans that in 1508 he was able to conclude with Louis XII., the emperor Maximilian, and Ferdinand of Aragon the famous league of Cambrai against the Venetian republic. In the spring of the following year the republic was placed under an interdict. The results of the league soon outstripped the primary intention of Julius. By the single battle of Agnadello the dominion of Venice in Italy was practically lost; but, as neither the king of France nor the emperor was satisfied with merely effecting the purposes of the pope, the latter found it necessary to enter into a combination with the Venetians to defend himself from those who immediately before had been his allies against them. The Venetians on making humble submission were absolved in the beginning of 1510, and shortly afterwards France was placed under the papal ban. Attempts to bring about a rupture between France and England proved unsuccessful, on the other hand, at a synod convened by Louis at Tours in September, 1510, the French bishops withdrew from the papal obedience, and resolved, with Maximilian's co-operation, to seek the deposition of Julius. In November, 1511, a council actually met for this object at Pisa. Julius hereupon entered into the Holy League with Ferdinand of Aragon and the Venetians against France, in which both Henry VIII. and the emperor ultimately joined. He also convened a general council (that afterwards known as the Fifth Lateran) to be held at Rome, in 1512, which, according to an oath taken on his election, he had bound himself to summon, but which had been delayed, he affirmed, on account of the occupation of Italy by his enemies. In 1512 the French were driven across the Alps, but it was at the cost of the occupation of Italy by the other powers, and Julius, though he had securely established the papal authority in the states immediately around Rome, was practically as far as ever from realizing his dream of an independent Italian kingdom when he died of fever, in February, 1513.

The abilities and ambition of Julius were regal and military rather than in any sense ecclesiastical. He was more concerned for his own personal fame as a member of the family of Della Rovere than for the advancement of the influence and authority of the

church. His dauntless spirit, his mastery of political stratagem, and his moral indifference in the choice of means rendered him the most prominent political figure of his time. While, however, his political and warlike achievements would alone entitle him to rank amongst the most remarkable of the occupants of the papal chair, his chief title to honor is to be found in his patronage of art and literature. He did much to improve and beautify the city; in 1506 he laid the foundation stone of St. Peter's; and he was the friend and patron of Bramante, Raphael, and Michelangelo. He was succeeded by Leo X.

See Dumesnil, *Histoire de Jules II.*, Paris, 1873; Broseh, *Papst Julius II.*, Gotha, 1878.

JULIUS III., Pope from 1550 to 1555, was born at Rome in 1487. He was of good family, his original name being Gian Maria del Monte. After attaining the dignity of archbishop of Siponto, he was in 1536 created cardinal by Paul III., by whom he was employed on several important legations; he was one of the presidents of the council of Trent during its session at Bologna, in April, 1547. In 1550 he was unanimously chosen successor of Paul III. He consented, at the request of the emperor Charles V., to the reopening of the council of Trent (in 1551), and he also entered into a league with him against the duke of Parma and Henry II. of France; but soon afterwards he deemed it advisable to make terms with his enemies, and in 1552 he again suspended the meetings of the council. From this time pope Julius seems to have lost interest both in political and ecclesiastical affairs; formerly he had acquired a reputation for impetuous energy as well as austerity, but he now exchanged these qualities for a love of luxurious ease, comporting himself at the entertainments given by him in his palace in a manner fitted to shock preconceived ideas of ecclesiastical propriety. He also aroused much scandal by creating as his first cardinal a youth of sixteen years of age, one of his pages, on account of the courage he had displayed when bitten by a monkey. The adornment of his palace and the laying out of his grounds occupied a large share of his attention, and have done more to make him remembered than his strictly pontifical procedure. Julius was a friend of the Jesuits, to whom he granted a fresh confirmation in 1550. He was succeeded by Marcellus II.

JULY, the seventh month in our present calendar, consists of thirty-one days. It was originally the fifth month of the year, and as such was called by the Romans *Quinctilis*. The later name of Julius was given in honor of Julius Cæsar (who was born in the month), and came into use in the year of his death. Our Anglo-Saxon ancestors called July *Mæd-mônâð*, "mead month," from the meadows being then in their bloom; and *äftera Liða*, "the latter mild month," in contradistinction to June, which they named "the former mild month." The principal days now observed and noted in this month are the following:—July 3d, Dog Days begin; July 15th, St. Swithin; and July 25th, St. James.

JUMET, or Jumetz, a town and commune of Belgium, in the arrondissement of Charleroi and the province of Hainault, is situated about 4 miles northeast of Charleroi. Its manufactures include glass-bottles, knives, nails, and hats; and there are extensive coal-mines in the neighborhood. The population of the commune in 1900 was 25,937.

JUMIÈGES, or Jumiéges, a village of France, in the department of Seine Inférieure and arrondissement of Rouen, about 16 miles southwest of Rouen, in one of the peninsulas formed by the winding of the Seine. The population was less than 2000 in 1901; but the place is famous for the imposing ruins of the abbey of Jumièges (Latinized as *Gemeticum*, *Gemedium Gimegiæ*, *Jumedica*, etc.), one of the great establishments of the Benedictine order. The principal remains are those of the Church of the Virgin, which had a central tower, the magnitude of which may be judged by one of the sustaining arches still extant. Among the minor relics are the stone which once covered the grave of Agnes Sorel, and two recumbent statues of the 13th century, popularly know as the *Énervés*, and explained by a baseless legend which makes them represent two sons of Clovis II., who were punished for revolt against their father by having the tendons of their arms and legs cut through, and being set adrift in a boat on the Seine.

The foundation of the abbey of Jumièges is generally assigned to St. Philbert, 664 A.D., whose name is still to be read on gold and silver coins obtained from the site. It was to Jumièges that abbot Sturm of Fulda was relegated (760–62), and thither it was that Charlemagne sent Thassilo, the captive duke of Bavaria, and his son Theodo. The 9th century was a period of pillage and disaster for the abbey, but the 11th and 12th centuries saw it raised to new splendor and greatness. One of its monks, Robert Champart, became, under Edward the Confessor, bishop of London and archbishop of Canterbury. Returning to die in his abbey (1052), he brought with him an Anglo-Saxon missal and pontifical, which are still preserved in the public library of Rouen. For further details see Mabillon, *Acta Sanct. ord. S. Benedicti*, tom. ii.; W. Calcul (a monk of Jumièges), *Hist. Norm.*, *apud* Duchesne; Deshayes, *Hist. de l'abbaye royale de Jumièges*, Rouen, 1829; Langlois, *Essai sur les Énervés de Jumièges*, Rouen, 1838; Cochet, *La Seine Inférieure*, Paris, 1864.

JUMILLA, a town of Spain, in the province of Murcia, is situated 37 miles northwest of Murcia, at the foot of a hill whose summit is crowned by a citadel. The streets are regular, clean, and well-paved, and there are three squares. Jumilla possesses two parish churches of some architectural merit, the church of Santiago in the Corinthian style being adorned with paintings of Rubens and other artists of fame, and with some beautiful frescoes. There is also a Franciscan convent and a hospital. The town is chiefly dependent on agriculture, but has corn and oil mills, brick-kilns, and manufactories of salt, coarse cloth, soap, and fire-arms. The population in 1901 was 16,100.

JUMNA, or Jamuná, one of the large rivers of northern India, rises in the Himálayas in Garhwál state, about 5 miles north of Jamnotri hot springs, in 31° 3′ N. lat. and 78° 30′ E. long. The stream first flows south for 7 miles, then southwest for 32 miles, and afterwards due south for 26 miles, receiving several small tributaries in its course. It afterwards turns sharply to the west for 14 miles, when it is joined by the large river Tons from the north. The Jumna here emerges from the Himálayas into the valley of the Dún, and flows in a southwesterly direction for 22 miles, dividing the Kiarda Dún on the west from the Dehra Dún on the east. It then, in the 95th mile of its course, forces its way through the Siwálik hills, and debouches upon the plains of India at Faizábád in Saháranpur district. By this time a large river, it gives off, near Faizábád, both the eastern and western Jumna canals. From Faizábád the river flows for 65 miles in a south-southwest direction, receiving the Maskarra stream from the east. Near Bidhauli, in Muzaffarnagar district, it turns due south for 80 miles to Delhi city; thence southeast for 27 miles to near Dankaur, receiving the waters of the Katha-nadí and Hindan river on the east, and of the Sabi-nadí on the east. From Dankaur it resumes its southerly course for 100 miles to Mahában near Muttra, where it turns eastwards for nearly 200 miles, passing the towns of Agra, Firozábád, and Etáwah, receiving on its left bank the Karwan-nadí, and on its right the Utanghan. From Etáwah it flows 140 miles southeast to Hamírpur, being joined by the Sengon on its north bank, and on the south by the great river Chambal from the west, and by the Sind. From Hamírpur, the Jumna flows nearly due east, until it enters Allahábád district and passes Allahábád city, 3 miles below which it falls into the Ganges in 25° 25′ N. lat. and 81° 55′ E. long. In this last part of its course it receives the waters of the Betwa and the Ken.

The Jumna, after issuing from the hills, has a longer course through the Northwestern Provinces than the Ganges, but it is not so large nor so important a river; and above Agra in the hot weather it dwindles to a small stream. This is no doubt partly caused by the eastern and western Jumna canals,—of which the former was excavated in 1823–30, and in its course of 130 miles irrigated, in 1875–76, 195,846 acres of the districts of Saháranpur, Muzaffarnagar, and Meerut, in the Northwestern Provinces; while the latter, consisting of the reopened channels of two canals dating from about 1350 and 1628 respectively, extends for 405 miles through the districts of Ambála, Karnúl, Delhi, and Rohtak in the Punjab, irrigating (1872–73) 351,820 acres.

The trade on the Jumna is not now very considerable; in its upper portion timber, and in the lower stone, grain, and cotton are the chief articles of commerce, carried in the clumsy barges which navigate its stream. Its waters are clear and blue, while those of the Ganges are yellow and muddy; the difference between the streams can be discerned for some distance below the point at which they unite. Its banks are high and rugged, often attaining the proportions of cliffs, and the ravines which run into it are deeper and larger than those of the Ganges. It traverses the extreme edge of the alluvial plain of Hindustán, and in the latter part of its course it almost touches the Bundelkhand offshoots of the Vindhyá range of mountains. Its passage is therefore more tortuous, and the scenery along its banks is more varied and pleasing, than is the case with the Ganges.

The Jumna at its source near Jamnotri is 10,849 feet above the sea-level; at Kotnur, 16 miles lower, it is only 5036 feet; so that, between these two places, it falls at the rate of 314 feet in a mile. At its junction with the Tons it is 1686 feet above the sea; at its junction with the Asan, 1470 feet; and at the point where it issues from the Siwálik hills into the plains, it is 1276 feet. The catchment area of the river is 118,000 square miles; its flood discharge at Allahábád is estimated at 1,333,000 cubic feet per second. The Jumna is crossed by railway bridges at Delhi, Agra, and Allahábád, while bridges of boats are stationed at Etáwah, Kalpi, Hamírpur, Muttra, Chillatára, and many other places.

JUNÁGARH, a native state in Káthiáwár, in the province of Guzerat, Bombay presidency, India, is situated between 20° 48′ and 21° 40′ N. lat., and between 69° 55′ and 71° 35′ E. long. The state, which comprises an estimated area of 3800 square miles, consists of a level plain, with the exception of the Gírnar group of hills, sacred to Jainism, the highest peak of which rises to about 3500 feet above sea-level. The coast-line is well supplied with fair-weather harbors, of which the chief are Verawál, Nawabandar, and Sutrapora. The ruined but famous temple of Somnáth is situated in the state. The estimated population in 1872 was 380,921, residing in eight hundred and ninety villages. The principal agricultural products are cotton (largely exported to Bombay for re-export), wheat, pulses and millets, oilseeds, and sugar-cane. The manufactures are oil and coarse cotton cloth. The estimated revenue is £200,000. Junágarh town, the fortified capital of the state, situated in 21° 31′ N. lat., 70° 36′ 30″ E. long., has an estimated population of 20,025.

Prior to 1746 Junágarh was a Rájput state ruled by chiefs of the Churásumá tribe, but in that year it was conquered by Sultán Muhammad Begára of Ahmadábád. In Akbar's reign it became a dependency of the court of Delhi, under the immediate authority of the Mughal viceroy of Guzerat. About 1735, when the representative of the Mughals had lost his authority in Guzerat, Sher Khán Bábi, a soldier of fortune under the viceroy, expelled the Mughal governor and established his own rule. Sher Khán's son, Salábat Khán, appointed his heir chief of Junágarh, assigning to his younger sons the lands of Bántwá. Though himself tributary to the gáekwár of Baroda and the British Government, the nawáb of Junágarh receives yearly contributions, called *zortalabi*, from a large number of the petty chiefs in Káthiáwár. This levy, which is collected and paid to the nawáb by British officers of the Káthiáwár agency, is a relic of the days of Mahometan supremacy. Junágarh ranks as a first-class state among the many chiefships of Káthiáwár, and its ruler first entered into engagements with the British in 1807.

JUNE, the sixth month in our present calendar, consists of thirty days. Ovid, in his *Fasti* (vi. 25), makes Juno assert that the name was expressly given in her honor:—

> "Ne tamen ignores vulgique errore traharis,
> Junius a nostro nomine nomen habet."

In another part of the *Fasti* (vi. 87) he gives the derivation *a junioribus*, as May had been derived from *Majores*. Others connect the term with the gentle name Junius, or with the consulate of Junius Brutus. Probably, however, it has an agricultural reference, and originally denoted the month in which crops grow to ripeness. In the old Latin calendar June was the fourth month, and in the so-called year of Romulus it is said to have had thirty days; but at the time of the Julian reform of the calendar its days were only twenty-nine. To these Cæsar added the thirtieth, which it still retains. The Anglo-Saxons had several names for the month of June. They called it "the dry month," "midsummer month," and, in contradistinction to July, "the earlier mild month." The summer solstice occurs in June. The principal days now observed in this month are the following:—June 11th, St. Barnabas; June 24th, Midsummer Day (Nativity of St. John the Baptist); and June 29th, St. Peter.

JUNG, Johann Heinrich (1740–1817), best known by his assumed name of Heinrich Stilling, charcoal-burner, tailor, village schoolmaster, oculist, professor of political science, and mystic, was born in the village of Grund in the duchy of Nassau on the 12th September, 1740. His father, Wilhelm Jung, schoolmaster and tailor, was the son of Eberhard Jung, charcoal-burner, and his mother was Dortchen or Dorothy Moritz, daughter of a poor clergyman. In the best of his books Stilling gives a charming description of the patriarchal simplicity of his home, and draws the portrait of his grandfather especially with a loving and skilful hand. Stilling became, by his father's desire, schoolmaster and tailor, but "to be always sitting at the needle and making clothes for people was highly repugnant to me," and "to be everlastingly instructing boys and girls in A B C" was equally wearisome. Severe home discipline made Stilling glad to accept an appointment as schoolmaster in a neighboring village, where, however, he taught not with pleasure but from a sense of duty. He afterwards became tutor in the family of a merchant, and in 1768 went with "half a French dollar," as he himself tells us, to study medicine at the university of Strasburg. What he wanted in money he possessed in confidence in Divine aid; and in after life he was wont to refute sceptical adversaries by recounting the many occasions on which his prayers were answered by providential messengers, for so he regarded them, who in the most unexpected way provided him with the money necessary not only for his studies but for his very existence. At Strasburg he met Goethe, who showed him much kindness, and introduced him to Herder. The acquaintance with Goethe ripened into friendship; and it was by his influence that Stilling's first and best work, *The Account of his Youth*, was in 1777 given to the world. In 1772 he settled at Elberfeld as physician and oculist, and soon became celebrated for operations in cases of cataract. Surgery, however, was not much more to his taste than tailoring or teaching; and in 1778 he was glad to accept the appointment of lecturer on "agriculture, technology, commerce, and the veterinary art" (?) in the newly established academy at Kaiserslautern. In 1784 the academy was transferred to Heidelberg and united with the university. In 1786,

on the occasion of the anniversary of the fourth centenary of Heidelberg university, Stilling created immense enthusiasm by delivering his speech, the last of the day, in German. The other professors had used Latin. In 1787 Stilling was appointed professor of economical, financial, and statistical science in the university of Marburg. In 1803 he resigned his professorship and returned to Heidelberg, where he remained with no official appointment until 1806. In that year he received a pension from the grand-duke Charles Frederick, of Baden, and removed to Carlsruhe, where he remained until his death on the 2d April, 1817. He was married three times, and left a numerous family. Of his engagement to his first wife he tells a most amusing story in his autobiography. Of his works this autobiography *Heinrich Stillings Leben*, from which he came to be known as Stilling, is the only one now of any interest, and, with the supplement by his son-in-law Dr. Schwarz, is the chief authority for his life. A believer in dreams and apparitions, he was superstitious rather than mystical. His piety was fervent, but not austere; and his chief delight was in seeing others happy. Modest and affable, he endeared himself to all who came in contact with him. He hated nothing except sects, which, he says, are due merely to pride under the mask of piety. He numbered among his many friends Goethe and Kant and Lavater, the first of whom pays him high tribute in the second part of *Aus Meinem Leben*.

A complete edition of his numerous works, in 14 vols. 8vo., was published at Stuttgart in 1835–38. There are English translations by Sam. Jackson of the *Leben*, London, 1835, and of the *Theorie der Geisterkunde*, London, 1834, and New York, 1851; and of *Theobald, or the Fanatic*, a religious romance, by the Rev. Sam. Schaeffer, Philadelphia, 1846.

JUNIPER. The junipers, of which there are about twenty-five species, are evergreen bushy shrubs or low columnar trees, with a more or less aromatic odor, inhabiting the whole of the cold and temperate northern hemisphere, but attaining their maximum development in the temperate zone in North America and Europe. The leaves are usually articulated at the base, spreading, sharp-pointed, and needle-like in form, destitute of oil-glands, and arranged in alternating whorls of three; but in some the leaves are minute and scale-like, closely adhering to the branches, the apex only free, and furnished with an oil-gland on the back. Sometimes the same plant produces both kinds of leaves on different branches, or the young plants produce acicular leaves, while those of the older plants are squamiform. The male and female flowers are usually produced on separate plants; the occurrence of both on the same plant is rare. The male flowers are developed at the ends of short lateral branches, are rounded or oblong in form, and consist of several antheriferous scales in two or three rows, each scale bearing three or six almost spherical pollen-sacks on its under side. The female flower is a small bud-like cone situated at the apex of a small branch, and consists of two or three whorls of two or three scales. The scales of the upper or middle series each produce one lateral ovule. The mature cone is fleshy, with the succulent scales fused together and forming the fruit-like structure known to the older botanists as the galbulus, or berry of the juniper. The berries are red or purple in color, varying in size from that of a pea to a nut. They differ considerably from the cones of other members of the order *Coniferæ*, to which the junipers belong. The seeds are usually three in number, sometimes fewer (1), rarely more (8), and have the surface near the middle or base marked with large glands containing oil. The genus occurs in a fossil state, four species having been described from rocks of Tertiary age.

Bentham and Hooker divide the genus into three sections, viz., *Sabina*, *Oxycedrus*, and *Caryocedrus*. *Juniperus Sabina* is the savin, an irregularly spreading much-branched shrub with scale-like glandular leaves, and emitting a disagreeable odor when bruised. The flesh and dried tops of savin are official in the British and United States pharmacopœias. The plant is poisonous, acting as a powerful local and general stimulant, diaphoretic, emmenagogue and anthelmintic; it is employed both internally and externally. *Juniperus bermudiana*, a tree about 40 or 50 feet in height, yields a fragrant red wood, which was used for the manufacture of "cedar" pencils. The tree is now very scarce in Bermuda, and the "red cedar," *Juniperus virginiana*, of North America is employed instead for pencils and cigar boxes. The red cedar is abundant in some parts of the United States, and in Virginia is a tree 50 feet in height. It is very widely distributed from the great lakes to Florida and round the Gulf of Mexico, and extends as far west as the Rocky Mountains. The wood is applied to many uses in the United States. The fine red fragrant heartwood takes a high polish, and is much used in cabinet work and inlaying, but the small size of the planks prevents its more extended use. The tops of the young branches are officinal in the United States Pharmacopœia. The galls produced at the ends of the branches have also been used in medicine, and the wood yields cedar-camphor and oil of cedar wood. The *Juniperus thurifera* is the incense juniper of Spain and Portugal, and *J. phœnicea* (*J. lycia*) from the Mediterranean district is stated by Loudon to be burned as incense,

Juniperus communis, the common juniper, and several other species, belong to the section *Oxycedrus*. The common juniper is a very widely distributed plant, occurring in the whole of northern Europe, central and northern Asia to Kamchatka, and North America. It grows at considerable elevations in southern Europe, in the Alps, Apennines, Pyrenees, and Sierra Nevada (4000 to 9000 feet). It also grows in Asia Minor, Persia, and at great elevations on the Himalayas. In former times the juniper seems to have been a very well-known plant, the name occurring almost unaltered in many languages. The dialectical names, chiefly in European languages, have been collected by Prince L. L. Bonaparte, and published in *The Academy* (July 17, 1880, No. 428, p. 45). The common juniper is officinal in the British pharmacopœia and in that of the United States, yielding the oil of juniper, a powerful diuretic, distilled from the unripe fruits. The wood is very aromatic, and is used for ornamental purposes. In Lapland the bark is made into ropes. The fruits are used for flavoring gin (a name derived from *juniper*, through the French *genièvre*); and in some parts of France a kind of beer called *Genévrette* was made from them by the peasants. *Juniperus Oxycedrus*, from the Mediterranean district and Madeira, yields cedar oil, which is officinal in most of the European pharmacopœias, but not in that of Britain.

The third section, *Caryocedrus*, consists of a single species, *Juniperus drupacea* of Asia Minor. The fruits are large and edible; they are known in the East by the name *Habhel*.

JUNIUS. This is the signature of an unknown writer who, after exciting and baffling the curiosity of three or four generations of critics, has been allowed to take rank amongst English classics under a pseudonym. The first of the published letters with this signature was dated January 21, 1769; the last, January 21, 1772. The entire series appeared in the *Public Advertiser*, a popular newspaper edited by Woodfall, to whom a number of private letters were also addressed by the same writer. These are included in the collected and complete editions, as well as a number of letters attributed on varying grounds, more or less satisfactory, to Junius.

The first of the letters was a sweeping attack on the Government for the time being. Its spirit may be judged from the concluding sentence: "They (posterity) will not believe it possible that their ancestors could have survived or recovered from so desperate a condition while a duke of Grafton was prime minister,

a Lord North chancellor of the exchequer, a Weymouth and a Hillsborough secretaries of state, a Granby commander-in-chief, and a Mansfield chief criminal judge of the kingdom." He does not condescend to particulars, and the letter might have passed unnoticed if Sir William Draper,[1] a man of considerable note, had not undertaken the defence of Lord Granby in answer to it. A bitter controversy ensued, which rapidly degenerated into an exchange of personalities, much to the disadvantage of Sir William. Then came letters to the duke of Grafton, the prime minister, directed more against his private character and conduct than his policy, the main charge against his Grace being his abandonment of Wilkes, whom Junius treats throughout the letters as the champion of the constitution, to be supported against the ministry and the crown. He takes Blackstone, the author of the *Commentaries*, severely to task for justifying the expulsion of Wilkes, whose cause he also espouses in an altercation with Horne Tooke; and he omits no opportunity of denouncing Luttrell, the elect of Middlesex. The address to the king, the most celebrated of Junius's compositions, after recapitulating the familiar charges of personal pique and favoritism, calls upon his Majesty to summon his whole council without consulting his minister: "Lay aside the wretched formality of a king, and speak to your subjects with the spirit of a man and in the language of a gentleman. Tell them you have been fatally deceived." Many of the letters turn on topics which have no longer the slightest interest. A long letter is addressed to Lord Mansfield for bailing a man named Eyre. In another, equally elaborate, this learned lord is accused of tampering with the common law by an admixture of the civil law, which is now regarded as his highest praise; Junius treats it as an attempt to undermine the liberties of England. He relies little on argument or proof. His force is in his style. He commonly assumes his victim to be what he wishes him to be thought, and produces the desired effect by irony, sarcasm, or polished invective. One of his happiest figures of speech is in the letter on the affair of the Falkland Islands: "Private credit is wealth; public honor is security; the feather that adorns the royal bird supports his flight; strip him of his plumage, and you fix him to the earth." Although an admirer of Lord Chatham, Junius agreed with Mr. Grenville as to the right of England to tax the colonies; and, although an uncompromising supporter of popular rights, he was an advocate or apologist for rotten boroughs.

The sensation Junius created in the political world may be inferred from the manner in which the leading orators and statesmen of the day spoke of him. "How comes this Junius," exclaimed Burke, addressing the Speaker, "to have broke through the cobwebs of the law, and to range uncontrolled, unpunished, through the land? The myrmidons of the court have been long, and are still, pursuing him in vain. They will not spend their time upon me or you. No, sir, they disdain such vermin when the mighty boar of the forest who has broke through all their toils is before them. But what will all their efforts avail? No sooner has he wounded one than he lays down another dead at his feet. For my part, when I read his attack upon the king, I own my blood ran cold." . . . . "Nor has he dreaded the terrors of your brow, but he has attacked even you—he has—and I believe you have no reason to triumph in the encounter. In short, after carrying away our royal eagle in his pounces and dashing him against a rock, he has laid you prostrate. King, lords, and commons are but the sport of his fury. Were he a member of this House, what might not be expected from his knowledge, his firmness, and integrity? He would be easily known by his contempt of all danger, by his pointed penetration and activity." Lord North spoke in the same strain: "Why should we wonder that the great boar of the wood, this mighty Junius, has broke through the toils and foiled the hunters? Though there may be at present no spear that will reach him, yet he may be some time or other caught."

What added signally to his influence was the general belief of his contemporaries that he was a man of rank and position, familiar with what was passing behind the scenes in high places; and this belief arose not simply from the intimate knowledge he showed of things and persons about the court and the principal departments of the state, but from the lofty and independent tone that was habitual and seemed natural to him,—as when he tells Sir William Draper, "I should have hoped that even my name might carry some authority with it if I had not seen how very little weight or consideration a printed paper receives even from the respectable signature of Sir William Draper;" or when in private letters to the publisher, after waiving all right to the profits of the publication, he says: "As for myself, be assured that I am far above all pecuniary views." . . . "You, I think, sir, may be satisfied that my rank and fortune place me above a common bribe."

In the preface to the second volume of Bohn's edition of 1855, no less than thirty-seven persons are enumerated to whom the authorship has been attributed. Contemporary opinion strongly inclined to Burke, whose power of assuming or disguising style is proved by his *Vindication of Natural Society;* and, as his biographer Prior pointedly remarks, "Contemporary opinion, as formed from a variety of minor circumstances which do not come within the knowledge of future inquirers, is perhaps, on such occasions, the truest." Dr. Johnson, who had entered the lists against Junius, told Boswell: "I should have believed Burke to be Junius, because I know no man but Burke who is capable of writing these letters; but Burke spontaneously denied it to me." Burke told Reynolds that he knew Junius, and uniformly spoke of him as he would hardly have spoken of himself. A very strong case was made out for Lord George Sackville, on whom, after Burke's denial, Sir William Draper's suspicions permanently fixed. Fox used to say that, although he would not take Singlespeech Hamilton against the field, he would back him against any single horse. Boyd is another candidate who did not lack supporters. A plausible claim was advanced for the American General Lee, backed by three experts who pretended to detect him by the handwriting. A famous expert, Imbert, gave a written certificate on the same ground in favor of Horne Tooke; and another, Netherclift, declared that there was more of the Junius character in the handwriting of Mrs. Dayrolles (the alleged amanuensis of Lord Chesterfield) than in any other specimen submitted to him as a possible performance by the great unknown. Other experts declared confidently for other claimants. But the identity remained an open question, and case after case was pronounced not proven, till the appearance of Mr. Taylor's *Junius Identified* in 1816, when Sir Philip Francis immediately became the favorite, and during the next half century the problem was pretty generally considered at an end.

Prior to the publication, Mr. Taylor called on Sir Philip to intimate what was intended, and came away with the impression that he was rather pleased than displeased with the intimation. In fact, he had been already playing Junius, and he continued playing the part till his death in 1818. "His first gift," writes his second wife, whom he married in 1814, two years before *Junius Identified*, "was an edition of Junius, which he bade me take to my room and not let it be seen or speak upon the subject; and his posthumous present, which his son found in his bureau, was *Junius Identified*, sealed up and directed to me." The real Junius might have bequeathed a much more conclusive legacy. He writes to Woodfall, December 17, 1771: "When the book is finished, let me have a sett (*sic*) bound in vellum, gilt, and lettered 'Junius I. II.' as handsomely as you can. The edges gilt, let the sheets

[1] He (1721–87) was educated at Eton and Cambridge, entered the army, served in the East, married Miss Delancey of New York, was lieutenant-governor of Minorca in 1779.—Am. Ed.

be well dried before binding. I must also have two setts in blue paper covers. This is all the fee I shall ever require of you." These were duly sent, and it would have been something to the purpose had Francis bequeathed one of them to his wife. Neither of them has turned up. The surviving son (by the first wife) likewise claimed the authorship for the father as a source of pride to the family, so that no evidence in their possession would have been kept back.

Pitt told Lord Aberdeen (the fourth earl) that he knew who Junius was, and that it was not Francis. On its being objected that the Franciscan theory had not been started till after Pitt's death, Lord Aberdeen replied "*that's stuff*," and proceeded to relate that he himself had once dined in company with Francis when proofs of his being Junius were adduced before him, that he had listened with evident pleasure, and at last exclaimed in a stilted theatrical manner, "God! if men force laurels on my head, I'll wear them." His immediate contemporaries remained unconvinced. Sir Fortunatus Dwarris states broadly that no one who knew, heard, or read Francis thought him capable of producing Junius. Lord Broughton confirmed this. Tierney said: "I know no better reason for believing the fellow to be Junius than that he was always confoundedly proud of something, and no one could ever guess what it could be."

Lord Stanhope, however, would admit no shadow of doubt upon the point, and Lord Macaulay declared that all reasoning from circumstantial evidence was at an end unless Francis were admitted to be Junius. Both these eminent authorities agree in resting their case on similarity of handwriting, on the internal evidence of style, and on five points which are summarily stated by Lord Macaulay in his essay on Warren Hastings. As regards similarity of handwriting, there is one plain test on which experts are agreed, namely, that "it is impossible for a man, in order to disguise his writing, to write better than he does habitually;" and the best penmanship of Junius is incomparably superior in fineness, delicacy, and grace to the best of Francis, who wrote a large, coarse, clerk-like hand. As regards style, the specimens culled from Francis's speeches and writings prove no more than that he, an assiduous imitator of Junius, succeeded occasionally in catching the mannerism, without any one of the distinctive merits, of his model. Lord Macaulay, not denying the inferiority, endeavors to weaken the argument drawn from it by remarking that it may be urged with at least equal force against every claimant that has ever been mentioned, with the single exception of Burke. "And what conclusion," he asks, "after all, can be drawn from mere inferiority? Every writer must produce his best work; and the interval between his best and his second best work may be very wide indeed." This undeniable truth might have been urged with equal force by any pretender to a disputed authorship,—for example, by Theophilus Swift, the dean's cousin, when he claimed the authorship of the *Tale of a Tub*. Surely the strongest argument in favor of any given candidate is that (tested by his known writings) he alone was equal to the authorship, and the strongest argument against any given candidate that (tested in the same manner) he was unequal to it. Francis put forth his full powers in his controversy with Hastings, and his friend D'Oyly writes to him in 1778 that the public who had followed the controversy allowed both to be good writers; "but, in their opinion, he (Hastings) takes the lead so decidedly as to admit of no comparison."

The five points (which have been logically resolved into three) remained untouched till the publication of the memoirs of Sir Philip Francis by Parkes and Merivale in 1867. This book entirely changed the aspect of the controversy by showing that Francis's position, opinions, interests, manner of life, and tone during the Junian period were the reverse of what those of Junius might be supposed to have been. During the whole of that period he was first clerk in the war office under Lord Barrington. Born in Dublin, October 22, 1740, he was in his thirtieth year when the famous letters commenced. He was the son of Dr. Francis, the translator of Horace, but had married under his station, and was associating principally with his wife's relatives and connections. The habits of his set may be collected from his letters, *e. g.*: "January 4, 1769: I am just returned from spending a riotous fortnight at Bath. Gravier and two others filled a post-coach, which was dragged with no small velocity by four horses. We travelled like gentlemen, and lived like rakes." February 12, 1771: "Tilman dined with me yesterday, and swallowed a moiety of two bottles of claret." . . . "We lead a jolly kind of life. This night to a concert, on Thusday to a ridotto, on Saturday the opera, and on Tuesday following a grand private ball at the London Tavern." July 26, 1771: "To-morrow Godfrey, Tilman, another gent, and I set out upon a tour through Derbyshire, and propose to reach Manchester." They did not return till August 13, the day on which Junius's reply to Horne Tooke appeared. On June 25, 1771, in the very thick of the Junian correspondence, Francis writes to a friend abroad: "For the next three years I am likely enough to remain in my present state of uninteresting indolence."

There is no trace at this time of any connection with the newspapers, nor of any earnest or sustained literary occupation. The only political personage we find him in communication with was Calcraft, to whom he occasionally supplied scraps of official news. By a startling coincidence, all the persons who had been kind or useful to him in promoting his advancement, including Wood (to whom he owed his clerkship), his chief (Lord Barrington), and Calcraft, were bitterly assailed by Junius. The predilections of the pair, the substance and the shadow, are as hard to reconcile as their antipathies. Junius had a high respect for Wilkes's judgment, and avows a liking for both the cause and the man. On November 8, 1771, he writes to Woodfall: "Show the dedication and preface of the letters to Mr. Wilkes, and if he has any material objection, let me know." Francis, in his private correspondence, uniformly expresses the most unmitigated contempt for Wilkes. He writes like one of the general public about Junius. Thus on June 12, 1770, to his brother-in-law: "Junius is not known, and that circumstance is perhaps as curious as any of his writings. I have always suspected Burke; but, whoever he is, it is impossible he can ever discover himself." Sir William Draper, Junius's first victim, was an old friend of the Francis family, and in a letter dated Bath, January 28, 1769, Dr. Francis writes to Philip: "Give my love to Mr. Calcraft. Tell him to expect a very spirited and exceedingly honorable defence of L. G—y (Granby) against the virulent Junius, by our friend Sir W. D—r. I truly honor him for it." Again, February 11, 1769: "Poor Sir William! I am glad he is gone to Clifton, where he may eat his own heart in peace. When he repeated to me some passages of his letter, I bid him prepare his best philosophy for an answer. But who is this devil Junius, or rather legion of devils? Is it not B—rke's pen dipped in the gall of Sa—lle's heart? Poor Sir William!"

One of Lord Macaulay's five points is that Junius was "bound by some strong tie" to the first Lord Holland, the friend of Dr. Francis and the early patron of Philip. Now in a fragment of autobiography (included in the memoirs) it is stated that, long before the Junius letters, Dr. Francis considered himself grossly ill used by Lord Holland, and "was stung with the idea of having been so long the dupe of a scoundrel." "In this," adds the son, "I concurred with him heartily." Another point, and a most important one, is that Francis bitterly resented the appointment (over his head) of Mr. Chamier to the place of deputy secretary-at-war, and that to the re-

sentment thus aroused was owing the downright ferocity, the brutal abuse (as Mr. Merivale calls it), with which Lord Barrington was assailed by Junius under the signature of Veteran. Laying out of the account the fact that Lord Barrington had been the object of Junius's unrelenting attacks for more than two years before the appointment of Chamier, it is sufficient to refer to Francis's letter of January 24, 1772, to Major Baggs, in which he says: "You will have heard that Mr. D'Oyly has resigned his employment (of deputy). He did it while I was at Bath. Immediately upon my return, My Lord Barrington was so good as to make me the offer with many obliging and friendly expressions. I had, however, solid reasons for declining the offer, and Mr. Anthony Chamier is appointed." He was obviously looking out for an Indian appointment, and left the war office in the March following, relying on Lord Barrington's aid in procuring one. After relating in the autobiography how he accidentally heard that Cholwell, one of the intended commissioners for India, had declined the appointment, he proceeds: "It was the king's birthday, and Barrington was gone to court. I saw him the next morning; and, as soon as I had explained my views, he wrote the handsomest and strongest imaginable letter in my favor to Lord North. Other interests contributed, but I owe my success to Lord Barrington." After his arrival in India, Francis was in the habit of writing long and confidential letters to Lord Barrington, who, in 1777, writes to express his gratification at the good understanding between Francis and Clavering. "I love you both so much that I cannot wish you to continue long in a situation so painful though so creditable to you." One of the first visits Francis paid on his return was to Lord Barrington at his country house. "It is the imputed folly," urge the opponents of the Franciscan theory, "not merely the imputed baseness of Francis that startles us. He is represented systematically writing against every friend, benefactor, and patron in succession, without a rational motive or an intelligible cause."

As if the embarrassments of his position were not enough, he must have gone out of his way to multiply them. The terms on which Junius stood with Sir William Draper are well known. In a letter dated February 14,1770, he describes Sir John Burgoyne as "sitting down for the remainder of his life infamous and contented." On December 11, 1787, when Francis was attacked in the House of Commons for having allowed himself to be included in the list of managers for the impeachment of Warren Hastings, his personal enemy, he rose and stated that the two persons whom he had consulted as the best judges of points of honor were Sir William Draper and Sir John Burgoyne. Draper was dead, but Burgoyne rose and handsomely responded to the appeal, which, if Francis was Junius, has been justly stigmatized as one of the strongest examples of gratuitous folly and brazen impudence on record.

That Earl Temple wrote or inspired Junius is a theory which has been maintained in two able essays, and it derives plausibility from Pitt's assertion that he knew who Junius was, as well as from the language of the Grenville family, which all points to Stowe as the seat of the mystery. The Right Hon. T. Grenville told the first duke of Buckingham, who thought he had discovered the secret, that it was no news to him, but for family reasons the secret must be kept. He also stated to other members of the family, subsequently to the publication of *Junius Identified*, that Junius was not either of the persons to whom the letters had been popularly ascribed. Lord Grenville told Lord Sidmouth that he (Lord G.) knew who Junius was. Lady Grenville told Sir Henry Holland and Dr. James Ferguson that she had heard Lord Grenville state that he knew who Junius was, and that it was not Francis. The handwriting of Countess Temple (supposed to have acted as the amanuensis of her lord) comes far the nearest to the Junian hand of any that have been produced as similar to it, especially as regards powers of penmanship; but evidence is altogether wanting that Earl Temple, or any one about him, possessed the required literary qualifications and capacity. The authorship of the letters, therefore, remains a mystery, and *Stat Nominis Umbra* is still the befitting motto for the title-page.

See John Wade, *Junius, including Letters by the same writer under other signatures, etc.*, 2 vols., 1850; Parkes and Merivale, *Memoirs of Sir Philip Francis, K.C.B., with Correspondence and Journals*, 2 vols., 1867; John Taylor, *Junius Identified*, 1816; A. Hayward, *More about Junius*, 1868; Charles Chabot, *The Handwriting of Junius Professionally Investigated*, with preface and collateral evidence by the Hon. E. Twisleton, 1871. (A. H.)

JUNIUS, Franciscus (1545–1602), in French François du Jon, Huguenot divine and writer, was born of good family at Bourges, in France, May 1, 1545. He was a precocious child, and had studied law for two years under Donellus, when a place in the retinue of the French ambassador to Constantinople was procured for him in his fifteenth year. Before he reached Lyons, where he was to join the ambassador, the latter had departed; but Junius, scarcely disappointed, found ample consolation in the better opportunities for study to be found at Lyons. A religious tumult warned the young Huguenot back to Bourges, where the judicious piety of his father not only won him from certain atheistic principles that he had imbibed at Lyons, but also inspired him with the desire of entering the church. To that end he went to study at Geneva, where he was reduced to the direst straits of poverty by the failure of remittances from home, owing to civil war in France. His pride or independence allowed him to accept only the barest sustenance from a humble friend who had himself been a protégé of Junius's family at Bourges, and his health was permanently injured by the weakness to which he was reduced. The long-expected remittance from home was closely followed by the news of the brutal murder of his father at Issoudun; and Junius resolved to remain at Geneva, where his reputation for learning now enabled him to find support by teaching. In 1565, however, he was appointed minister of the Walloon congregation at Antwerp. His foreign birth excluded him from the privileges of the native Reformed pastors, and exposed him to the persecutions of Margaret of Parma, governess of the Netherlands. Several times he barely escaped arrest, and finally, after spending six months in preaching at Limburg, he was forced to retire to Heidelberg in 1567. There he was welcomed by the elector Frederick, and temporarily settled in charge of a church at Schönau; but in 1568 his patron sent him as chaplain with the prince of Orange in his unfortunate expedition to the Netherlands. Junius escaped as soon as he could from that post, and returning to his church remained there till 1573. From 1573 till 1578 he was at Heidelberg, assisting Tremellius in his Latin version of the Old Testament, which appeared at Frankfort in 1579; and after two and a half years distributed between Neustadt and Otterburg he was appointed to the chair of divinity at Heidelberg. Thence in a short time he was taken to France by the duke of Bouillon, and after an interview with Henry IV. was sent again to Germany on a mission. As he was returning to France, he was named professor of theology at Leyden. In that office, which he filled with success and popularity, he died October 13, 1602. Junius was a learned and pious man, and in that age of illiberal theologians was distinguished for his liberality. He was several times married; "quatuor uxores," he naively expresses himself in his autobiography, "duxi *hactenus*."

He was a voluminous writer on theological subjects, and translated and composed many exegetical works. He is best known from his own edition of the Latin Old Testament, slightly altered from the former joint edition, and

with a version of the New Testament added (Geneva, 1590; Hanover, 1624). The *Opera Theologica Francisci Junii Biturigis* were published at Geneva, 2 vols., 1613, to which is prefixed his autobiography, written about 1592. The last had been published at Leyden, 1595, and is reprinted in the *Miscellanea Groningana*, vol. i., along with a list of the author's other writings.

JUNIUS, Franciscus (1589–1677), son of the foregoing, was born at Heidelberg in 1589. Brought up at Leyden, his attention was diverted from military to theological studies by the peace of 1609 between Spain and the Netherlands. In 1620 he went to England, where he became librarian to the earl of Arundel, and remained thirty years. He devoted himself to the study of Anglo-Saxon, and afterwards of the cognate old Teutonic languages,—a branch of study in which he has high claims to honor, not only from his own valuable labors in a hitherto almost completely neglected field, but also from having directed the scholarly attention of others to it. In 1650 Junius returned to Holland, where he continued to study as zealously as ever. For two years he lived in Friesland in order to study the peculiar old dialect. In 1675 he returned to England; in 1677 he went to live at Windsor with his nephew, Isaac Vossius, in whose house he died, November 19, 1677.

The uneventful life of Junius was eminently the life of a student; fourteen hours a day were spent at his desk; and the results are seen in his books and in the rich collection of ancient MSS., edited and annotated by him, which he bequeathed to the university of Oxford. Junius published *De Pictura Veterum*, 1637 (in English by the author, 1638; enlarged and improved edition, edited by Grævius, who prefixed a life of Junius, and with a catalogue of architects, painters, etc., and their works, Rotterdam, 1694); *Observationes in Willerami Abbatis Francicam Paraphrasin Cantici Canticorum*, Amst., 1655; *Annotationes in Harmoniam Latino-Francicam quatuor Evangelistarum, Latine a Tatiano confectam*, Amst., 1655; *Cædmonis Paraphrasis Poetica Geneseos*, Amst., 1655; *Quatuor D. N. J. C. Evangeliorum Versiones Perantiquæ Duæ, Gothica scilicet et Anglo-Saxonica*, Dort, 2 vols., 1665 (The Gothic version in this book Junius transcribed from the Silver Codex of Ulfilas; the Anglo-Saxon version is from an edition by Thomas Marshall, whose notes to both versions are given, and a Gothic glossary by Junius); *Etymologicum Anglicanum*, edited by Edmund Lye, and preceded by a life of Junius and Hickes's Anglo-Saxon grammar, Oxford, 1743. Grævius gives a list of the MSS. presented by Junius to Oxford; the most important are a version of the *Ormulum*, the version of Cædmon, and 9 volumes containing *Glossarium V. Linguarum Septentrionalium*.

JUNO, one of the chief goddesses of the Roman state, was identified through the influence of Greek religion with the Hellenic goddess Hera. It is exceedingly unlikely that this identification is grounded on any real connection between the two, as is the case with Zeus and Jupiter (see Jupiter); it was suggested solely by some superficial points of resemblance. There was a certain analogy in the relation which they respectively bore to the chief god; but it is probable that the marriage of Jupiter and Juno is not a native but a borrowed idea. In Latin and in modern literature the character of Juno is wholly that of the Greek Hera (see Hera). The opinion is general that Juno is not an Aryan goddess, but adopted from a non-Aryan race; if so, she must be Etruscan. One of the chief cults of Juno in Rome was that of Juno Regina on the Aventine. She had been brought thither by Camillus when Rome conquered the Etruscan city of Veii and adopted its patron goddess Juno. The Etruscan name is apparently Uni (see Deecke, *Das Templum von Piacenza*). Another great seat of the worship of Juno was Lanuvium. When that city was conquered, the cultus of Juno Sospita was carried to Rome and established on the Palatine hill. Had Juno been an Aryan goddess, we should certainly find a strong naturalistic element in her; but in fact her sphere is almost entirely limited to human life and action. She must, therefore, have been adopted from some civilized race, where the moral side of the divine conception had been developed, and the naturalistic element which originally belongs to all deities had lost prominence. At Veii, Lanuvium, and other places Juno was the protecting goddess of the state and of society, and in a similar way she had been worshipped at Rome from the earliest times under the epithets Curiatia and Populona.

The great cultus of Juno at Rome was on the Capitol, where Tarquin had established her beside Jupiter to share with him the sovereignty of the state. Though she has nothing to correspond to the naturalistic side of Jupiter, she is readily associated with him in his moral character. She is the patroness and guardian of women, as he is of men. She watches over women from their birth onward. As Virginensis she protects maidenhood; as Pronuba, Juga or Jugalis, Domiduca, Unxia, Cinxia, she ushers them through all the rites of marriage; as Matrona she presides over their wedded life; as Lucina she helps them in childbirth. The Kalends were sacred to Juno, as the Ides belong to Jupiter; and thus the two divide the month and the year between them. Geese were her favorite birds, and those which were kept in the Capitoline temple gave the garrison timely warning of the Gallic attack. The chief feast of Juno was the Matronalia, on the Kalends of March. Only maidens and wives of stainless character could participate in the procession which was made to the temple of Lucina on the Esquiline hill. On this, the first day of the year, the women received presents from their husbands and relatives, and gave presents to their slaves. The name Junones was also applied to the attendant spirits who belong to each woman, just as each man has his own genius. A woman swears by her Juno, a lover by the Juno of his mistress; hence the sarcasm of Juvenal, "per Junonem domini jurante ministro." When Rome began to coin money in order to compete with the currency of the Greek states on the south coast, the mint was the temple of Juno Moneta; but this was probably due to Greek influence. The coinage was modelled on that of the cities of Magna Græcia, which it was designed to supplant; and these cities had their religious centre in the temple of Hera Lacinia (see Curtius, "Religious Character of Greek Coins," *Numism. Chron.*, 1870, p. 102).

JUNOT, Andoche (1771–1813), Duc d'Abrantès, was born at Bussy-le-Grand, 23d October, 1771. He went to school at Chatillon, and was known among his comrades as a blustering but lovable creature, with a pugnacious disposition. He came under the special notice of Napoleon during the siege of Toulon, while serving as his secretary. It is related that as he was taking down a despatch, a shell bursting hard by and covering the paper with sand, he exclaimed "Bien! nous n'avions pas de sable pour secher l'encre! en voici!" He accompanied Napoleon to Italy in the capacity of aide-de-camp, and distinguished himself so much at the battle of Millesimo that he was selected to carry back the captured colors to Paris. Returning to Italy, he went through the campaign with honor, but was badly wounded in the head at Lonato. From the effects of the wound he never completely recovered, and many rash incidents in his career may be directly traced to it. During the expedition to Egypt he acted as general of brigade, and went through fourteen brilliant hours of fighting at Nazareth, putting 10,000 Turks to flight with 300 troopers. His devotion to Napoleon involved him in a duel with General Lanusse, in which he was again wounded. He had to be left in Egypt to recover, and in crossing to France was captured by English cruisers. On his return to France he was made commandant of Paris, and afterwards promoted general of division. He next served at Arras in command of the grenadiers of the army destined for the invasion of England, and made some alterations in the equipment of the troops which received the praise of the emperor. It was, however, a bitter mortification that he was not appointed a marshal of France when he received the

cross of the legion of honor. He was sent to Lisbon instead, his entry into which city was something like a royal progress, though his vanity was disappointed by the mission. He was so restless and dissatisfied in the Portuguese capital that he set out, without leave, for the army of Napoleon, and at Austerlitz behaved with conspicuous courage and zeal. But he soon offended the emperor by his manner and his demands, and was sent to Parma to put down an insurrection and to be out of the way. In 1806 he was recalled and became governor of Paris. His extravagance and prodigality shocked the Government, and some rumors of an intrigue with Joséphine made it desirable again to send him away. He was, therefore, appointed to lead an invading force into Portugal. For the first time Junot had a great task to perform, and only his own resources to fall back upon for its achievement. Early in November, 1807, he set out from Salamanca, crossed the mountains of Beira, rallied his broken forces at Abrantès, and, with 1500 men, dashed upon Lisbon. The whole movement only took a month; he was then invested with the governorship. Administration was his weak point, and in a short time, instead of consolidating the results of his victory, he had squandered them by a course of conduct like that of an Eastern monarch. After Wellesley encountered him at Vimiera he was obliged to withdraw from Portugal with all his forces. Napoleon disapproved, but sent him back to Spain, where, acting under Massena, he was once more seriously wounded. His last campaign was made in Russia, and he got more than a just share of the discredit which attached to it. Napoleon next appointed him to govern Illyria. On the 29th July, 1813, he threw himself from a window at Montbard, in a fit of insanity.

JUNOT, Laure Permon (1784–1838), Duchesse d'Abrantès, was born at Montpellier, 6th November, 1784. Her father was an army contractor, who allowed his wife to take his daughters to Paris in order that they might make good matches. They were lively, witty young ladies, and soon attracted to their hotel a mixed society of officers. Madame Junot declared that Napoleon wished to marry her mother; but there is no evidence for the truth of the story. But he gave Laure Permon 100,000 francs when she married Junot, and after the birth of her first child a house in the Champs-Elysées, with 100,000 francs to furnish it. Her husband had extravagant tastes; but she was extravagant to recklessness, contracting debts as rapidly as tradesmen would allow her to run them up. In 1805 she went with her husband to Lisbon, and, as she took it on her to represent "female France," her train was more expensive than that of a queen. After she returned to Paris, she renewed her extravagance, and, opening her drawing-room to the older families as well as to the new men of the empire, she fell under suspicion. With Junot she went through the Spanish campaign, and contrived to give pleasant balls and to hold drawing-rooms all along the route. After her husband's death she was forbidden to return to Paris, but she ignored Napoleon's order, returned, opened her house again, and attracted to it all the celebrities of the day. Her poverty compelled her to retire to L'Abbaye- aux-Bois when the empire ended; but she devoted herself to literature with much zeal. She made social recollections from her own life her chief subject; her style was free and flowing; and her articles, memoirs, and romances were widely read. She died at Paris, 7th June, 1838.

JUPITER was the chief god of the Roman state. The great and constantly growing influence exerted from a very early period on Rome by the superior civilization of Greece not only caused a modification of the Roman god after the analogy of Zeus, the supreme deity of the Greeks, but led the Latin writers to identify the one with the other, and to attribute to Jupiter myths which were purely Greek and never belonged to actual Roman religion. The Jupiter of actual worship was a Roman god; the Jupiter of Latin literature was more than half Greek. From the Latin this composite deity has passed into modern literature, and under the name of Jupiter is understood a god whose character is half Roman half Greek; while the legends, family history, and posterity attributed to him are wholly Greek. The identification was facilitated by the community of character which really belonged to Jupiter and Zeus as the Roman and Greek developments of the original Aryan conception of God; whereas the analogy between the non-Aryan Juno of Rome and the Aryan Hera of Greece was very slight. As we have in the two gods one original form differently developed by Roman and Greek genius, it is impossible to treat the one without frequent reference to the other; but it is equally necessary to treat them separately. The highest religious conceptions of each race are summed up in the characters of Jupiter and Zeus, and an account of them must be in reality an outline of the growth of religious thought among Romans and Greeks.

Every influence which affected the growth of the Roman state affected also the religion; and along with the development of Rome out of many elements we have a development of the state god Jupiter out of the original Aryan deity. The state, beginning with a mixture of Latin and Sabine population, soon acquired also Etruscan colonists, who were for a time the ruling element in the state; and, although the dynasty was expelled, yet the Etruscan civilization exerted an immense influence on Roman religion. Jupiter, the Vedic *dyaus pitar*, invoked by the Greeks as Ζεῦ πάτερ, was the god both of Latins and Sabines. He was identified with the Etruscan Tina, and acquired something of his character. But another influence was felt at an early period. Greek civilization, spreading from Cumæ, revolutionized Etruscan art and modified Etruscan thought. The influence was strongly exerted in Rome also. Under such various influences grew the Roman religion, and it was completed as a national institution when Tarquin, the same king that received into Rome the prophetic books of the Cumæan Sibyl, enthroned Jupiter Optimus Maximus on the Capitoline hill as the guardian and protector of the fully formed Roman state. Many separate cults of Jupiter, originating from different sections of the mixed state, still continued, but were quite overshadowed by the great worship. Several of these worships puzzled the antiquarians of later Rome, and it became a question how far their objects were identical with or distinct from Jupiter. The ceremonial of these ancient cults, of Vejovis the Asylum-god on the Capitol, of Jupiter Stator on the Palatine, of Dius Fidius or Semo Sancus on the Aventine, of Consus the god of good counsel who ruled in the lower world in the Circus, and of many others, would throw much light on the beginnings of the Roman state; but our information on the subject is very scanty. This being the case, we cannot assign to each influence its exact share in developing the Roman conception, though certain elements may be distinguished as more primitive than others. It is also impossible to distinguish accurately the different cults of Jupiter.

The original naturalistic element, the Græco-Italian god whose power is embodied in the phenomena and the cyclic changes of the heavens, never disappeared. Jupiter or Diespiter is under various epithets, Lucetius, Pluvius, etc., the god of clear and clouded sky, of light and darkness, of thunder and rain. By the proper ceremonies he can be drawn down in lightning to the earth, as Elicius and Indiges, to supply it with rain and springs. Every place which he strikes with the lightning is marked as his own, and is surrounded with a wall to keep off the profane from holy ground. As Averruncus and Depulsor, Jupiter protects men from the effects of the portents that he himself sends from heaven. Through such portents he also reveals his will to men, and proper interpretation of them will enable men to walk securely before heaven. There

can be little doubt that this character as revealer of fate is almost wholly Etruscan, as all the rules of interpretation came from that people. A stone, the symbol of the thunderbolt, was the old symbol of the god, and never became wholly obsolete; hence the phrase *per Jovem lapidem jurare*. Among trees the oak, among birds the woodpecker, were originally sacred to him; but afterwards the eagle and other symbols were, under Greek influence, associated with Jupiter Capitolinus. The identity of many of these attributes with those of the Greek Zeus is obvious. Equally striking is the double character of god both among the dead and among the living which originally belonged to both gods, and was from different causes lost sight of in both cases. In Rome Etruscan influence changed the old views about the nature of the future world; and only some ceremonies, understood by neither priests nor people, preserved the original idea. In nothing was Etruscan influence more conspicuous at Rome than in the gloomy views of the future world that it introduced. The priest of Jupiter, *flamen Dialis*, might not touch a corpse; if his wife, the *flaminica*, died he lost his office. His life was complicated by a multitude of prohibitions: he must not touch a dog or a she-goat, nor see an army, nor take off his pointed cap, nor leave the city for a night, and so on. Violation of any rule, even by accident, entailed impurity on himself and on the whole state, and in some cases made him forfeit his office.

A moral side in the Roman conception of God is apparent at a very early period, and probably was never wholly wanting. Jupiter is the fatherly ruler of mankind: he protects all the higher elements of human society, guards the sanctity of oaths, the rights of strangers and suppliants, the unity of the state, and the intercourse with other peoples. When a foreign state had injured Rome, it was forbidden to begin war without a formal declaration by the fetiales or heralds, the ministers of Jupiter. Headed by the *pater patratus populi Romani*, they appealed to Jupiter to witness that they had been wronged, and denounced ruin on the wrong-doers. Having thus through his representative on earth solemnly warned the guilty, the god as Victor led his people to conquest. When the army returned, their entry was a religious ceremonial in honor of Jupiter. The general, as representative of Jove, was borne on a gilded chariot drawn by four white horses through the Porta Triumphalis to the temple on the Capitol, where he offered a solemn sacrifice to the god, and laid on his knees the victor's laurels. In the ceremony the victorious general was invested with the purple toga, the tunica palmata, the sceptre and crown of gold, which belong to a god, not to a man; while the four-horse chariot itself is the symbol of apotheosis. So the *spolia opima* were dedicated by the general who won them to Jupiter Feretrius in the Capitol. Also to Jupiter, as supreme god of the state, the consuls sacrificed when they assumed office, and the young men when they put on the toga virilis. The Ides of the month were always sacred to Jupiter.

The chief festivals celebrated in honor of Jupiter were the Ludi Romani and the Ludi Magni, the Ludi Capitolini instituted in honor of the deliverance of Rome from the Gauls, and the Ludi Plebeii instituted to commemorate the reconciliation between the two orders in the state. In all of them there was included a feast of the magistrates and senators in the Capitol, to which the three deities, Jupiter, Juno, and Minerva, were invited, and places were left for them. Outside of Rome the chief cultus of Jupiter was that on the Alban mount, where Jupiter Latiaris had been the god who guarded the league of the thirty Latin cities. When Rome destroyed, or rather absorbed, this league, she kept up the worship that had hallowed it. The Feriæ Latinæ were celebrated every year by the consuls on a day appointed by themselves before they went forth to war. Accompanied by representatives of the Latin cities, they offered a sacrifice of white oxen to Jupiter. Other festivals of Jupiter show his old character as patron of agriculture, especially the different feasts called Vinalia; in this character Liber, who was once only a form of Jupiter, had almost entirely supplanted him. The word *liber*, originally an epithet of the chief god, gradually acquired distinct personality, and became the name of a god who was assimilated to the Greek Dionysus.

The Romans had in themselves none of the anthropomorphic Greek spirit: while Greek gods were concrete personal beings, Roman gods were almost pure abstractions. The personal element was not wholly wanting, for the gods were conceived as distinguished by sex, and as possessing names which must be concealed lest enemies should know and use them. But to the Roman the gods were little more than spiritual principles of earthly things; each man had his *genius*, the wood had its Silvanus. There was no mythology, —no marriages and births of gods, no family relationships. But when Greek influence became powerful, and the Italian deities Saturnus and Ops had been identified with Cronos and Rhea, Jupiter like Zeus was called their son, and the Greek tales about the conduct of Zeus to his parents were applied to the Latin god. On the Capitol Jupiter was enthroned between Juno on the left and Minerva on the right. The two goddesses now became his wife and his daughter. In like manner the Roman poets attributed to Jupiter all the legends about Zeus, and invented new tales and new amours on Italian soil after the analogy of the Greek. The artistic rendering of the conception of Jupiter is wholly borrowed from the Greek, and can be dealt with only in treating of the Greek deity. The first temple on the Capitol was built after the Etruscan model; but when it was destroyed in 83 B.C., it was rebuilt in Greek style. (W. M. RA.)

JURA. This range may be roughly described as the block of mountains rising between the Rhine and the Rhone, and forming the frontier between France and Switzerland. The gorges by which these two rivers force their way to the plains cut off the Jura from the Swabian and Franconian ranges to the north and those of Dauphiné to the south. But in very early days, before these gorges had been carved out, there were no openings in the Jura at all, and even now its three chief rivers—the Doubs, the Loue, and the Ain—flow down the western slope, which is both much longer and but half as steep as the eastern. Some geographers extend the name Jura to the Swabian and Franconian ranges between the Danube and the Neckar and the Main; but, though these are similar in point of composition and direction to the range to the south, it is most convenient to limit the name to the mountain ridges lying between France and Switzerland, and this narrower sense will be adopted here.

The Jura has been aptly described as a huge plateau about 156 miles long and 38 miles broad, hewn into an oblong shape, and raised by internal forces to an average height of from 1950 to 2600 feet above the surrounding plains. The shock by which it was raised, and the vibration caused by the elevation of the great chain of the Alps, produced many transverse gorges or "cluses," while on the plateaus between these subaerial agencies have exercised their ordinary influence.

Geologically, the sedimentary rocks of the Jura belong to the Mesozoic age, and were deposited in a sea of variable depth, traces of which survive in the vast salt mines from which Salins and Lons-le-Saunier derive their names. The special name of these fossiliferous strata is Oolitic: they are also called Jurassic, from the fact that the Jura is entirely made up of such layers. They include sands, sandstones, marls, clays, and limestones; and the water that deposited these strata must have been highly charged with carbonate of lime, since calcareous rocks abound in the Jura. The action on these rocks of the carbonic acid gas discharged by all animals has been to transform them into bicarbonate of lime, a very soluble body, and hence the work

of erosion has been much facilitated. The countless blocks of gneiss, granite, and other crystalline formations which are found in such numbers on the slopes of the Jura, and go by the name of "erratic blocks" (of which the best known instance—the Pierre à Bot—is 40 feet in diameter, and rests on the side of a hill 900 feet above the Lake of Neuchâtel), have been transported thither from the Alps by ancient glaciers, which have left their mark on the Jura range itself in the shape of striations and moraines.

The general direction of the chain is from northeast to southwest, but a careful study reveals the fact that there were in reality two main lines of upheaval, viz., north to south and east to west, the former best seen in the southern part of the range, and the latter in the northern; and it was by the union of these two forces that the lines northeast to southwest (seen in the greater part of the chain), and northwest to southeast (seen in the Villebois range at the southwest extremity of the chain), were produced. This is best realized if we take Besançon as a centre; to the north the ridges run east and west; to the south, north and south, while to the east the direction is northeast to southwest.

Before considering the topography of the interior of the Jura, it may be convenient to take a brief survey of its outer slopes.

1. The *northern face* dominates on one side the famous "Trouée" (or Trench) of Belfort, one of the great geographical centres of Europe, whence routes run north down the Rhine to the North Sea, southeast to the Danube basin and Black Sea, and southwest into France and so to the Mediterranean basin. It is now so strongly fortified that it becomes a question of great strategical importance to prevent its being turned by means of the great central plateau of the Jura, which, as we shall see, is a network of roads and railways. On the other side it overhangs the "Trouée" of the Black Forest towns on the Rhine (Rheinfelden, Säckingen, Laufenburg, and Waldshut) through which the central plain of Switzerland is easily gained. On this north slope two openings offer routes into the interior of the chain,—the valley of the Doubs belonging to France, and the valley of the Birs belonging to Switzerland. Belfort is the military, Mülhausen the industrial, and Basel the commercial centre of this slope.

2. The *eastern and western faces* offer many striking parallels. The plains through which flow the Aar and the Saône have each been the bed of an ancient lake, traces of which remain in the lakes of Neuchâtel, Bienne, and Morat. The west face runs mainly north and south like its great river, and for a similar reason the east face runs northeast to southwest. Again, both slopes are pierced by many transverse gorges or "cluses" (due to fracture and not to erosion), by which access is gained to the great central plateau of Pontarlier, though these are seen more plainly on the east face than on the west; thus the gorges at the exit from which Lons le Saunier, Poligny, Arbois, and Salins are built balance those of the Suze, of the Val de Ruz, of the Val de Travers, and of the Val d'Orbe, though on the east face there is but one city which commands all these important routes—Neuchâtel. This town is thus marked out by nature as a great military and industrial centre, just as Besançon on the west, which has besides to defend the route from Belfort down to Doubs. These easy means of communicating with the Free County of Burgundy or Franche Comté accounts for the fact that the dialect of Neuchâtel is Burgundian, and that it was held generally by Burgundian nobles, though most of the country near it was in the hands of the house of Savoy until gradually annexed by Bern. The *Chasseron* (5286 feet, is the central point of the eastern face, commanding the two great railways which join Neuchâtel and Pontarlier. It is in a certain sense parallel to the valley of the Loue on the west face, which flows into the Doubs a little to the south of Dôle; the only important town of the central portion of the Saône basin. South of the Val d'Orbe the east face becomes a rocky wall crowned by all the highest summits of the chain—the *Mont Tendre* (5512 feet), the *Dôle* (5507 feet), the *Reculet* (5643 feet), the *Crêt de la Neige* (5653 feet), and the *Grand Credo* (5276 feet), the uniformity of level being as striking as on the west edge of the Jura, though there the absolute height is far less. The position of the Dôle is similar to that of the Chasseron, as along the sides of it run the great roads of the *Col de St. Cergues* (4159 feet), and the *Col de la Faucille* (4341 feet), the latter leading through the Vallée des Dappes, which was divided in 1862 between France and Switzerland, after many negotiations. The height of these roads shows that they are passages across the chain, rather than through natural depressions.

3. The *southern face* is supported by two great pillars—on the east by the *Grand Credo* and on the west by the ridge of *Revermont* (2529 feet) above Bourg en Bresse; between these a huge bastion (the district of *Bugey*) stretches away to the south, forcing the Rhone to make a long détour. On the two sides of this bastion the plains in which Ambérieu and Culoz stand balance one another, and are the meeting points of the routes which cut through the bastion by means of deep gorges. On the eastern side this great wedge is steep and rugged, ending in the *Grand Colombier* (5033 feet) above Culoz, and it sinks on the western side to the valley of the Ain, the district of Bresse, and the plateau of Dombes. The junction of the Ain and the Surand at Pont d'Ain on the west balances that of the Valserine and the Rhone at Bellegarde on the east.

The Jura thus dominates on the north one of the great highways of Europe, on the east and west divides the valleys of the Saône and the Aar, and stretches out to the south so as nearly to join hands with the great mass of the Dauphiné Alps. It therefore commands the routes from France into Germany, Switzerland, and Italy, and hence its enormous historical importance.

Let us now examine the topography of the interior of the range. This naturally falls into three divisions, each traversed by one of the three great rivers of the Jura—the Doubs, the Loue, and the Ain.

1. In the *northern division* it is the east and west line which prevails—the *Lomont*, the *Mont Terrible*, the defile of the Doubs from St. Ursanne to St. Hippolyte, and the "Trouée" of the Black Forest towns. It thus bars access to the central plateau from the north, and this natural wall does away with the necessity of artificial fortifications. This division falls again into two distinct portions.

(*a*) The first is the *part east of the deep gorge of the Doubs* after it turns south at St. Hippolyte; it is thus quite cut off on this side, and is naturally Swiss territory. It includes the basin of the river Birs, and the great plateau between the Doubs and the Aar, on which, at an average height of 2600 feet, are situated a number of towns, one of the most striking features of the Jura. These include Locle and La Chaux de Fonds, and are mainly occupied with watchmaking, an industry which does not require bulky machinery, and is therefore well fitted for a mountain district.

(*b*) *The part west of the "Cluse" of the Doubs.*—Of this, the district east of the river Dessoubre, isolated in the interior of the range (unlike the Locle platean), is called the "*Haute Montagne*," and is given up to cheese-making, curing of hams, saw mills, etc. But little watchmaking is carried on there, Besançon being the chief French centre of this industry, and being connected with Geneva by a chain of places similarly occupied, which fringe the west plateau of the Jura. The part west of the Dessoubre, or the *Moyenne Montagne*, a huge plateau north of the Loue, is more especially devoted to agriculture, while along its north edge metal working and manufacture of hardware are carried on, particularly at Besançon and Audincourt.

2. The *central division* is remarkable for being without the deep gorges which are found so frequently in other parts of the range. It consists of the basin of which Pontarlier is the centre, through notches in the rim of which routes converge from every direction; this is the great characteristic of the middle region of the Jura. Hence its immense strategical and commercial importance. On the northeast roads run to Morteau and Locle, on the northwest to Besauçon, on the west to Salins, on the southwest to Dôle and Lons-le-Saulnier, on the east to the Swiss plain. The Pontarlier plateau is nearly horizontal, the slight indentations in it being due to erosion, *e. g.*, by the river Drugeon. The keys to this important plateau are to the east the *Fort de Joux*, under the walls of which meet the two lines of railway from Neuchâtel, and to the west *Salins*, the meeting place of the routes from the Col de la Faucille, from Besançon, and from the French plain.

The Ain rises on the south edge of this plateau, and on a lower shelf or step, which it waters, are situated two points of great military importance—Nozeroy and Champagnole. The latter is specially important, since the road leading thence to Geneva traverses one after another, not far from their head, the chief valleys which run down into the South Jura, and thus commands the southern routes as well as those by St. Cergues and the Col de la Faucille from the Geneva region, and a branch route along the Orbe River from Jougne. The fort of *Les Rousses*, near the foot of the Dôle, serves as an advanced post to Champagnole, just as the Fort de Joux does to Pontarlier.

The above sketch will serve to show the character of the

central Jura as the meeting place of routes from all sides, and the importance to France of its being strongly fortified, lest an enemy approaching from the northeast should try to turn the fortresses of the "Trouée de Belfort." It is in the western part of the central Jura that the north and south lines first appear strongly marked. There are said to be in this district no less than fifteen ridges running parallel to each other, and it is these which force the Loue to the north, and thereby occasion its very eccentric course. The cultivation of wormwood wherewith to make the tonic "absinthe" has its headquarters at Pontarlier.

3. The *southern division* is by far the most complicated and entangled part of the Jura. The lofty ridge which bounds it to the east forces all its drainage to the west, and the result is a number of valleys of erosion (of which that of the Ain is the chief instance), quite distinct from the natural "cluses" or fissures of those of the Doubs and of the Loue. Another point of interest is the number of roads which intersect it, despite its extreme irregularity. This is due to the great "cluses" of Nantua and Virieu, which traverse it from east to west. The north and south line is very clearly seen in the eastern part of this division; the northeast and southwest is entirely wanting, but in the Villebois range south of Ambérieu we have the principal example of the northwest to southeast line. The plateaus west of the Ain are cut through by the valleys of the Valouse and of the Surand, and like all the lowest terraces on the west slope do not possess any considerable towns. The Ain receives three tributaries from the east:—

(*a*) The *Bienne*, which flows from the fort of Les Rousses by St. Claude, the industrial centre of the South Jura, famous for the manufacture of wooden toys, owing to the large quantity of boxwood in the neighborhood. Septmoncel is busied with cutting of gems, and Morez with watch and spectacle making. Cut off to the east by the great chain, the industrial prosperity of this valley is of recent origin.

(*b*) The *Oignon*, which flows from south to north. It receives the drainage of the lake of Nantua, a town noted for combs and silk weaving, and which communicates by the "cluse" of the Lac de Silan with the Valserine valley, and so with the Rhone at Bellegarde, and again with the various routes which meet under the walls of the fort of Les Rousses, while by the Val Romey and the Séran Culoz is easily gained.

(*c*) The *Albarine*, connected with Culoz by the "cluse" of Virieu, and by the Furan flowing south with Belley, the capital of the district of Bugey (the old name for the South Jura).

The "cluses" of Nantua and Virieu are now both traversed by important railways; and it is even truer than of old that the keys of the South Jura are Lyons and Geneva. But of course the strategic importance of these gorges is less than appears at first sight, because they can be turned by following the Rhone in its great bend to the south.

The name Jura, which occurs in Cæsar and in Strabo, is a form of a word which appears under many forms (*e. g.*, Joux, Jorat, Jorasse, Juriens), and is a synonym for a wood or forest. The German name is *Leberberg*, *Leber* being a provincial word for a hill.

Politically the Jura is French (departments of the Doubs, Jura, and Ain) and Swiss (parts of the cantons of Geneva, Vaud, Neuchâtel, Bern, Solothurn, and Basel); but at its north extremity it takes in a small bit of Alsace (Pfirt or Ferrette). In the Middle Ages the southern, western, and northern sides were parcelled out into a number of districts, all of which were gradually absorbed by the French crown, viz., Gex, Val Romey, Bresse, and Bugey (exchanged in 1601 by Savoy for the marquisate of Saluzzo), Franche Comté, or the Free County of Burgundy, an imperial fief till annexed in 1674, the county of Montbéliard (Mümpelgard), acquired in 1793, and the county of Ferrette (French, 1648–1871). The northern part of the eastern side was held by the bishop of Basel as a fief of the empire, but was given to Bern in 1815 (as a recompense for its loss of Vaud), and now forms the Bernese Jura, a French-speaking district. The centre of the eastern slope formed the principality of Neuchâtel and the county of Vallangin, which were generally held by Burgundian nobles, came by succession to the kings of Prussia in 1707, and were formed into a Swiss canton in 1815, though they did not become free from formal Prussian claims until 1857. The southern part of the eastern slope originally belonged to the house of Savoy, but was conquered bit by bit by Bern, which was forced in 1815 to accept its subject district Vaud as a colleague and equal in the Swiss Confederation. It was Charles the Bold's defeats at Grandson and Morat which led to the annexation by the Confederates of these portions of Savoyard territory.

See E. F. Berlioux, *Le Jura*, Paris, 1880; Adolphe Joanne, *Jura et Alpes Françaises*, Paris, 1877; Id., *Géographies Départementales* (the Doubs, Jura, and Ain volumes); Charles Sauria, *Le Jura pittoresque*. (W. A. B. C.)

JURA, an eastern frontier department of France, formed of the southern portion of the old province of Franche-Comté, owes its name to the offshoots and plateaus of the Jura mountains, which occupy more than half its area. It is bounded N. by Doubs, Haute-Saône, and Côte-d'Or; E. by Doubs, Ain, and Switzerland; S. by Ain; and W. by Saône-et-Loire and Côte-d'Or. Lying between 46° 15′ and 47° 17′ N. lat., and between 5° 15′ 39″ and 6° 8′ 9″ E. long., its greatest length from north to south is 143 miles, and its greatest breadth from east to west 83 miles. The department is divided by a not very broad zone of hills into a region of plain in the north and northwest, and a region of mountains in the southeast, increasing in height towards the Swiss frontier. The highest summit is Noir Mont (5085 feet). Jura belongs almost entirely to the basin of the Rhone,—its chief streams being the Oignon, Doubs, and Seille, affluents of the Saône, and the Ain and Valserine, direct tributaries of the Rhone. The Doubs and Ain are navigable. There are numerous lakes; those of Rousses, Châlin, Chambly, and of the abbey of Grandvaux are noteworthy. The climate is, on the whole, cold; the temperature is subject to sudden and violent changes, and among the mountains winter lingers for nearly six months. The plain called the Bresse is rich in fruit trees, and in fields of wheat, rye, maize, and buckwheat; the hill-region grows vines, barley, oats, maize, rape, walnuts, and fruits; the mountains, which exhibit some of the grandest scenery of leaping torrent and silent tarn, are covered with forests or pastures. Jura is one of the most thickly wooded departments of France; a third of its surface is covered with forests, of which that of Chaux, with an area of about 75 square miles, is the largest. The commonest trees are oaks, beeches, hornbeams, aspens, birches, box-trees, and firs. Wolves and foxes are numerous in Jura; wild boars and deer lurk in the forests. The principal minerals are iron, salt, limestone, marble, sandstone, millstone, and clay. Peats are very abundant. Agriculture employs about three-fourths of the inhabitants, though the manufactures extend to wine, cheese (made in the mountain dairies), watches, files, stationery, toys and fancy wooden-ware, machinery, candles, porcelain, basket-work, etc.; while some industry is maintained in wool-spinning, silk-weaving, and in brass, pottery, and tanning works. The trade is mainly in wines, cheese, and wooden goods. The first are full-bodied, stout, and rather coarse-flavored; their chief market is Paris, where they form the basis of the *vin ordinaire* of the wine-shops. The department of Jura embraces the arrondissements of Lons-le-Saunier, Dôle, Poligny, and St. Claude, with 32 cantons and 583 communes. Lons-le-Saunier is the chief town. The total area is about 1928 square miles; the population in 1866 was 298,477; 1901, 261,288.

JURA, an island of the inner Hebrides, on the west coast of Argyllshire, Scotland, the fourth largest of the group, is situated between 55° 52′ and 56° 9′ N. lat., and 5° 43′ and 6° 8′ W. long. On the north it is separated from the island of Scarba by the whirlpool of Corryvreckan, on the east from the mainland by Jura Sound, which is 10 miles broad, and on the south and southwest from Islay by Islay Sound. The area is about 160 square miles, the greatest length about 27 miles, and the breadth about 6. A chain of rugged hills, rising into eminences called the Paps of Jura, the highest summit of which is 2500 feet, traverses the

whole extent of the island, interrupted only by Tarbert Loch, an arm of the sea, which forms an indentation into the island of nearly 6 miles, and almost cuts it in two. Jura derived its name, meaning "deer island," from the red deer which abounded on it. On the pasturage a considerable number of black cattle are raised; and some corn and potatoes are cultivated along the eastern shore. Fishing is prosecuted to a small extent. The population, which in 1851 was 1064, was 800 in 1901.

JURIEU, PIERRE (1637–1713), a French Protestant theologian, was born in 1637 at Mer, in Orléanais, where his father was a Protestant pastor. He studied at Saumur and afterwards at Sedan under his maternal grandfather, the famed theologian Pierre Dumoulin, who died about the time that Jurieu left Sedan. After completing his studies in England under his maternal uncle Dumoulin, Jurieu received Episcopal ordination there, and returning to France succeeded his father as pastor of the church at Mer. In 1674 he accepted the chair of theology and Hebrew at Sedan, where he soon afterwards became also pastor. Both as preacher and professor he obtained a very high reputation, but much of the legitimate influence of his talents was destroyed by the extreme warmth of his controversial temper, which frequently developed into an irritated fanaticism verging on insanity. On the suppression of the university of Sedan in 1681, Jurieu received an invitation to a church at Rouen, but dreading persecution on account of a work he was about to publish, entitled *La Politique du Clergé de France*, he went to Holland and became soon after pastor of the Walloon church of Rotterdam, an office which he occupied till his death, 11th January, 1713.

Deeply pained by the revocation of the Edict of Nantes, Jurieu turned for consolation to the prophecies of the Apocalypse, and succeeded in persuading himself that the overthrow of Antichrist would take place in 1689, and afterwards, when that year had passed without the fulfilment of the prophecy, in 1715. Jurieu defended the doctrines of Protestantism with great ability against the attacks of Arnauld and Bossuet, but was equally ready to enter into dispute with his fellow Protestant divines when their opinions differed from his own even on minor matters. The bitterness and persistency of his attacks on his colleague Bayle led to the latter being deprived of his chair in 1693. In his favor it must, however, be mentioned that he was actuated in his controversies not by a mean jealousy of his opponents, but by a sincere anxiety for truth. One of the most important works of Jurieu is *Lettres Pastorales adressées aux Fidèles de France*, 3 vols., Rotterdam, 1686 and 1687, which found its way into France notwithstanding the vigilance of the police, and produced a deep impression on the Protestant population. Besides his numerous other controversial writings, which deal with nearly every topic in regard to which difference of opinion was possible, Jurieu was the author of a *Traité dela Dévotion*, Rouen, 1679.

JURISPRUDENCE. See LAW.

JURY. The essential features of trial by jury, as practised in England and countries influenced by English ideas, are the following. The jury are a body of laymen selected by lot to ascertain, under the guidance of a judge, the truth in questions of fact arising either in a civil litigation or in a criminal process. They are generally twelve in number, and their verdict, as a general rule, must be unanimous. Their province is strictly limited to questions of fact, and within that province they are still further restricted to the exclusive consideration of matters that have been proved by evidence in the course of the trial. They must submit to the direction of the judge as to any rule or principle of law that may be applicable to the case; and, even in deliberating on the facts, they receive, although they need not be bound by, the directions of the judge as to the weight, value, and materiality of the evidence submitted to them. Further, according to the general practice, they are selected from the inhabitants of the locality, whether county or city, within which the cause of action has arisen or the crime has been committed, so that they bring to the discharge of their duties a certain amount of independent local knowledge, an element in the institution which is by no means to be ignored. Such in general terms is the famous judicial institution the development of which is generally regarded as one of the greatest achievements of English jurisprudence.

What is the origin of this very remarkable and characteristic system? That is a question which has engaged the attention of many learned men. The fullest discussion of the subject is contained in Forsyth's *Trial by Jury*, published in 1852, and more concise notices of the various theories that have been advanced will be found in Stubbs's *Constitutional History*, vol. i., and in Freeman's *Norman Conquest*, vol. v. Until quite recently this, like all other institutions, was popularly regarded as the work of a single legislator, and in England it is one of the achievements usually assigned to Alfred. It is needless to say that there is no historical foundation whatever for such a supposition, nor is it much more correct to regard it as "copied from this or that kindred institution to be found in this or that German or Scandinavian land," or brought over ready made by Hengist or by William.[1] "Many writers of authority," says Canon Stubbs, "have maintained that the entire jury system is indigenous in England, some deriving it from Celtic tradition based on the principles of Roman law, and adopted by the Anglo-Saxons and Normans from the people they had conquered. Others have regarded it as a product of that legal genius of the Anglo-Saxons of which Alfred is the mythic impersonation, or as derived by that nation from the customs of primitive Germany or from their intercourse with the Danes. Nor even when it is admitted that the system of recognition was introduced from Normandy have legal writers agreed as to the source from which the Normans themselves derived it. One scholar maintains that it was brought by the Norsemen from Scandinavia; another that it was derived from the processes of the canon law; another that it was developed on Gallic soil from Roman principles; another that it came from Asia through the crusades," or was borrowed by the Angles and Saxons from their Slavonic neighbors in northern Europe. The true answer is that forms of trial resembling the jury system in various particulars are to be found in the primitive institutions of all nations. That which comes nearest in time and character to trial by jury is the system of recognition by sworn inquest, introduced into England by the Normans. "That inquest," says Mr. Stubbs, "is directly derived from the Frank capitularies, into which it may have been adopted from the fiscal regulations of the Theodosian code, and thus own some distant relationship with the Roman jurisprudence." However that may be, the system of recognition consisted in questions of fact, relating to fiscal or judicial business, being submitted by the officers of the crown to sworn witnesses in the local courts. It is pointed out by Mr. Freeman that the Norman rulers of England were obliged, more than native rulers would have been, to rely on this system for accurate information. They needed to have a clear and truthful account of disputed points set before them, and such an account was sought for in the oaths of the recognitors.[2] The Norman Conquest, therefore, fostered the growth of those native germs common to England with other countries out of which the institution of juries grew. Recognition, as introduced by the Normans, is only, in this point of view, another form of the same principle which shows itself in the compurgators, in the *frithbock*, in every detail of the action of the popular courts before the Conquest.

[1] Freeman, *Norman Conquest*, vol. v., p. 451.

[2] This fact would account for the remarkable development of the system on English ground, as contrasted with its decay and extinction in France.

Admitting with Mr. Stubbs that the Norman recognition was the instrument which the lawyers in England ultimately shaped into trial by jury, Mr. Freeman maintains none the less that the latter is a distinctively English thing. Mr. Forsyth comes to substantially the same conclusion. Noting the jury germs of the Anglo-Saxon period, he shows how out of those elements, which continued in full force under the Anglo-Normans, was produced at last the institution of the jury. "As yet it was only implied in the requirement that disputed questions should be determined by the voice of sworn witnesses taken from the neighborhood, and deposing to the truth of what they had seen or heard." What was wanting was to mould the procedure into shape, and that it did not attain until a century after the Conquest.

The inquest by recognition, which was employed generally for the ascertainment of facts, as for example in assessing taxation, is exemplified in legal matters by the process known as the assize or the great assize, applicable to questions affecting freehold or status. Defendant in such an action was enabled by an enactment of Henry II. to decline the trial by combat and choose the trial by assize, which was conducted as follows. The sheriff summoned four knights of the neighborhood, who being sworn, chose twelve lawful knights who were most cognizant of the facts, who should determine on their oaths which had the better right to the land. If they all knew the facts and were agreed as to their verdict, well and good; if some or all were ignorant, the fact was certified in court, and new knights were named, until twelve were found to be agreed. The same course was followed when the twelve were not unanimous. New jurors, as they may be called, were added until the twelve were agreed. This was called afforcing the assize. At this point the knowledge on which the jurors acted was their own personal knowledge, acquired independently of the trial. "So entirely," says Forsyth, "did they proceed upon their own previously formed view of the facts in dispute that they seem to have considered themselves at liberty to pay no attention to evidence offered in court, however clearly it might disprove the case which they were prepared to support." The use of recognition is prescribed by the constitutions of Clarendon for cases of dispute as to lay or clerical tenure. See Forsyth, p. 131; Stubbs, vol. i. p. 617.

In criminal cases there appears to be a more complete approximation to the jury in Anglo-Saxon times in the twelve senior thegns, who, according to an ordinance of Æthelred II. were sworn in the county court that they would accuse no innocent man and acquit no guilty one. The twelve thegns were a jury of presentment or accusation, like the grand jury of later times, and the absolute guilt or innocence of those accused by them had to be determined by subsequent proceedings—by compurgation or the ordeal. Whether this is the actual origin of the grand jury or not, the assizes of Clarendon and Northampton establish the criminal jury on a definite basis. By the articles of visitation of 1194, four knights are to be chosen from the county who by their oath shall choose two lawful knights of each hundred or wapintake, or, if knights be wanting, free and legal men, so that the twelve may answer for all matters within the hundred, including, says Stubbs, "all the pleas of the crown, the trial of malefactors and their receivers, as well as a vast amount of civil business." This is the historical grand jury. The petty jury, as it is called, which is the real jury of trial, appears to have arisen as an alternative to the trial by ordeal. A person accused by the inquest of the hundred was allowed to have the truth of the charge tried by another and different jury.[1] "There is," says Forsyth, "no possibility of assigning a date to this alteration." "In the time of Bracton (middle of the 13th century) the usual mode of determining innocence or guilt was by combat or appeal. But in most cases the appellant had the option of either fighting with his adversary or putting himself on his county for trial"—the exceptions being murder by secret poisoning, and certain circumstances presumed by the law to be conclusive of guilt. Some doubt has been expressed whether the twelve jurors who tried the crime were not identical with the accusing jurors, but the separation between the two juries was at any rate complete in the reign of Edward III. (Forsyth, p. 206).[2]

So far we have arrived at the establishment of the jury system in its modern form, alike in civil and in criminal proceedings; and, whatever differences may be traceable in the history of the civil and criminal jury respectively, their subsequent development is one. And there is one great feature by which the jury at the stage we have now reached is distinguished from the jury of modern times. The jury still certify to the truth from their knowledge of the facts, however acquired. In other words, they still retain the character of witnesses. The complete withdrawal of that character from the jury is connected by Forsyth with the ancient rules of law as to proof of written instruments, and a peculiar mode of trial *per sectam*. When a deed is attested by witnesses, you have a difference between the testimony of the witness, who deposes to the execution of the deed, and the verdict of the jury as to the fact of execution. It has been contended with much plausibility that in such cases the attesting witnesses formed part of the jury. Forsyth doubts that conclusion, although he admits that, as the jurors themselves were originally mere witnesses, there was no distinction in principle between them and the attesting witnesses, and that the attesting witnesses might be associated with the jury in the discharge of the function of giving a verdict. However that may be, in the reign of Edward III., although the witnesses are spoken of "as joined to the assize," they are distinguished from the jurors. The trial *per sectam* was used as an alternative to the assize or jury, and resembled in principle the system of compurgation. The claimant proved his case by vouching a certain number of witnesses (secta), who had seen the transaction in question, and the defendant rebutted the presumption thus created by vouching a larger number of witnesses on his own side. In cases in which this was allowed, the jury did not interpose at all, but in course of time the practice arose of the witnesses of the secta telling their story to the jury. In these two instances we have the jury as judges of the facts sharply contrasted with the witnesses who testify to the facts; and, with the increasing use of juries and the development of rules of evidence, this was gradually established as the true principle of the system. In the reign of Henry IV. we find the judges declaring that the jury after they have been sworn should not see or take with them any other evidence than that which has been offered in open court. But the personal knowledge of the jurors was not as yet regarded as outside the evidence on which they might found a verdict, and the stress laid upon the selection of jurymen from the neighborhood of the cause of the action shows that this element was counted on, and, in

[1] The distinction between the functions of the grand jury, which presents or accuses criminals, and the petty jury, which tries them, has suggested the theory that the system of compurgation is the origin of the jury system—the first jury representing the compurgators of the accuser, the second the compurgators of the accused.

[2] The number of the jury (twelve) is responsible for some unfounded theories of the origin of the system. This use of twelve is not confined to England, nor in England or elsewhere to judicial institutions. "Its general prevalence," says Hallam (*Middle Ages*, chap. vii.), "shows that in searching for the origin of trial by jury we cannot rely for a moment upon any analogy which the mere number affords." In a *Guide to English Juries, by a Person of Quality*, 1682 (attributed to Lord Somers), the following passage occurs: "In analogy of late the jury is reduced to the number of twelve, like as the prophets were twelve to foretell the truth; the apostles twelve to preach the truth; the discoverers twelve, sent into Canaan to seek and report the truth; and the stones twelve that the heavenly Hierusalem is built on." Lord Coke indulged in similar speculations.

fact, deemed essential to a just consideration of the case. Other examples of the same theory of the duties of the jury may be found in the language used by legal writers. Thus it has been said that the jury may return a verdict although no evidence at all be offered, and again, that the evidence given in court is not binding on the jury, because they are assumed from their local connection to be sufficiently informed of the facts to give a verdict without or in opposition to the oral evidence. A recorder of London, *temp.* Edward VI., says that, "if the witnesses at a trial do not agree with the jurors, the verdict of the twelve shall be taken and the witnesses shall be rejected." Forsyth suggests as a reason for the continuance of this theory that it allowed the jury an escape from the *attaint*, by which penalties might be imposed on them for delivering a false verdict. They could suggest that the verdict was according to the fact, though not according to the evidence. With the disuse of attaints, the contrary rule came in, and it was established that where a juryman is acquainted with material facts he should tell the court in order that he may be sworn as a witness; and it was clearly laid down by Lord Ellenborough that, if a judge directed the jury that they might be guided by their own knowledge of the facts independently of the evidence, such a direction would be wrong.

The ordinary jury in civil and criminal trials has now been traced down to the point at which its constitution became stereotyped. An important point still wants some historical explanation. The rule requiring a unanimous verdict has been variously accounted for, but Mr. Forsyth's explanation appears conclusive. He regards the rule as intimately connected with the original character of the jury as a body of witnesses, and with the conception common in primitive society that safety is to be found in the number of witnesses, rather than the character of their testimony. The afforcing of the jury above described marks an intermediate stage in the development. Where the juries were not unanimous, new jurors were added until twelve were found to be of the same opinion. From the unanimous twelve selected out of a larger number to the unanimous twelve constituting the whole jury was a natural step, which, however, was not taken without some hesitation. In some old cases we find that the verdict of eleven jurors out of twelve was accepted, but it was decided in the reign of Edward III. that the verdict must be the unanimous opinion of the whole jury. Diversity of opinion was taken to imply perversity of judgment, and the law sanctioned the application of the harshest methods to produce unanimity. The jurors were not allowed to eat or drink but by leave of the justices; and they might be carried round the circuit in carts until they agreed. These rough enforcements of an unanimous verdict have been softened by later practice, but the rule itself remains.

We may now turn to the jury in actual operation. And let us notice first the various kinds of jury known to English law.

1. *The Grand Jury.*—The origin of this has been explained above. This is the jury which presents indictments for trial by the petty or ordinary jury. The sheriff is directed to summon twenty-four or more persons, out of whom the jury may be chosen; but not more than twenty-three are to be chosen, so that twelve may be a majority.[1] The verdict of less than twelve, although a majority of the whole body, cannot be accepted, but the verdict of twelve is sufficient although the others may dissent. The grand jury, after a general charge from the judge, consider the bills of indictment in private, hearing such of the witnesses as they think fit. If they consider that a *prima facie* case is made out against the accused, they return the indictment into court as a true bill, which then becomes the foundation of the process before the petty jury. If they think otherwise they *ignore* the bill, or send it back into court torn up. They have thus a kind of veto on the cases submitted for trial. As these for the most part have been previously investigated by magistrates who have committed the accused for trial, the utility of the grand jury depends very much on the character of the justices' courts. As a review of the discretion of stipendiary magistrates in committing cases for trial, the judgment of the grand jury is admittedly superfluous; and even when the committing justice is an unlearned magistrate, it seems very doubtful if much is gained by subjecting his open decisions to the control of a secret tribunal. It used to be urged by the defenders of the system that it secures the attendance of the landed gentry and the county justices at the assizes—a kind of argument which is no longer so cogent as it once was. Mr. Forsyth thinks that the grand jury will often baffle "the attempts of malevolence" by ignoring a malicious and unfounded prosecution, but they may also defeat the ends of justice, and they have done so ere now, by shielding a criminal with whom they have strong political or social sympathies. The qualification of the grand jurymen is that they should be freeholders of the county,—to what amount appears to be uncertain.

2. The *Coroner's Jury* is undeterminate in number, but the finding must be that of twelve at least of the jurymen. Persons found guilty on this inquest may be put on trial before a petty jury at assizes.

3. *Special and Common Juries.*—This distinction belongs properly to civil trials. The practice of selecting special jurors to try important cases appears to have sprung up, without legislative enactment, in the procedure of the courts. Forsyth says that the first statutory recognition of it is so late as 3 Geo. II. c. 25, and that in the oldest book of practice in existence (Powell's *Attorney's Academy*, 1623) there is no allusion to two classes of jurymen. The Acts, however, which regulate the practice allude to it as well established. The statute now in force (33 & 34 Vict. c. 7) defines the class of persons entitled and liable to serve on special juries thus:—every man whose name shall be on the juror's book for any county, etc., and who shall be legally entitled to be called an esquire, or shall be a person of higher degree, or a banker or merchant, or who shall occupy a house of a certain rateable value (*e.g.*, £100 in a town of 20,000 inhabitants, £50 elsewhere), or a farm of £300, or other premises at £100. A special juryman receives a fee of a guinea for each cause. Either party may obtain a special jury, but must pay the additional expenses created thereby unless the judge certifies that it was a proper case to be so tried. For the common jury any man is qualified and liable to serve who has £10 by the year in land or tenements of freehold, copyhold, or customary tenure; or £20 on lands or tenement held by lease for twenty-one years or longer, or who being a householder is rated at £30 in Middlesex, or £20 in any other county. See 6 Geo. IV. c. 50; and 33 & 34 Vict. c. 77 (the Juries Act). A schedule to the last-cited Act contains a list of the numerous classes of persons exempted from service, which include members of the legislature and judges, ministers of various denominations, and practising lawyers of all grades. These are juries invariably employed in the superior courts. In the county court the jury consists of five.

Formerly aliens were entitled to be tried by a jury *de medietate linguæ*—half being Englishmen and half foreigners, not necessarily of the same country as the accused. This privilege has been abolished by the Naturalization Act.

A *jury of matrons* is resorted to, in a writ *de ventre inspiciendo*, or when a female prisoner, condemned to death, pleads pregnancy in stay of execution.

From the beginning parties have been allowed to

[1] Blackstone puts the principle as being that no man shall be convicted except by the unanimous voice of twenty-four of his equals or neighbors—twelve on the grand, and twelve on the petty jury.

challenge the jury. In civil and criminal cases a challenge *for cause* is allowed; in criminal cases only, a peremptory challenge is also allowed. In the former case the challenge may be either to the *array*, *i.e.*, to the whole number of jurors returned, or to the *polls*, *i.e.*, to the jurors individually. A challenge to the array is either a *principal* challenge (on the ground that the sheriff is a party to the cause, or related to one of the parties), or a challenge for *favor* (on the ground of circumstances implying "at least a probability of bias or favor in the sheriff"). A challenge to the polls is an exception to one or more jurymen on either of the following grounds:—(1) *propter honoris respectum*, as when a lord of parliament is summoned; (2) *propter defectum*, for want of qualification; (3) *propter affectum*, on suspicion of bias or partiality; and (4) *propter delictum*, when the juror has been convicted of an infamous offence. The challenge *propter affectum* is, like the challenge to the array, either principal challenge or "to the favor." Prisoners in criminal trials were by common law entitled to a peremptory challenge without cause shown to the number of thirty-five jurors; and so the law remains, after some fluctuation, in the case of treason. In other cases it is limited to twenty. The crown is no longer entitled to a peremptory challenge as at common law; but the cause of challenge need not be assigned by the crown until the whole list has been gone through, or unless there remain no longer twelve jurors left to try the case, exclusive of those challenged—an arrangement which practically amounts to giving the crown the benefit of a peremptory challenge.

One other special point remains to be mentioned. The province of the jury is to judge of facts; they have nothing to do with the law—which they must take from the presiding judge at the trial. The old *decantatum* assigns to each his own independent function:—"Ad quæstionem legis judices respondent, ad quæstionem facti juratores." But while the jury are supposed in legal theory to be absolute masters of the questions of fact, in practice they are largely controlled by the judges. Not only does the judge at the trial decide as to the admissibility of questions, but he advises the jury as to the logical bearing of the answers on the issue. Further, after a jury has given its verdict, it may be challenged in the courts on the ground that it is against the evidence, or on the ground that there was no evidence to go before the jury. A verdict is said to be against the evidence when the jury have completely misapprehended the facts proved, —when the logical conclusion to be drawn from the facts is the opposite of that which the jury have drawn. The court will not disturb the verdict of a jury on this ground when the judge who presided at the trial is not dissatisfied with the verdict. And it has been ruled emphatically that, when there is conflicting testimony as to the point at issue, it is exclusively for the jury to say which side is to be believed, and the court will not interfere with the verdict. To upset a verdict on the ground that "there was no evidence to go to the jury" implies that the judge at the trial ought to have withdrawn the case. The meaning of the phrase "evidence to go before the jury" is nowhere definitely ascertained, and a consideration of decided cases makes the difficulty more apparent. The question arises most frequently perhaps in cases involving an imputation of negligence—*e. g.*, in an action of damages against a railway company for injuries sustained in a collision. Juries are apt to infer negligence very easily, and the court has to say whether, on the facts proved, there was any evidence of the defendant's being guilty of negligence. This is by no means the same thing as saying whether, in the opinion of the court, they were so guilty. The court may be of opinion that on the facts they were not guilty, yet the facts themselves may be of such a nature as to be evidence of guilt to go before a jury. When the facts proved are such that a reasonable man might have come to the conclusion that there was negligence, then, although the court may wholly reject the conclusion in its own mind, it must admit that there is evidence to go before the jury. That perhaps is as near as we have yet got to an understanding of a phrase in daily use in the superior courts; but it scarcely determines what relation between the facts proved and the conclusion to be established is necessary to make the facts evidence from which a jury may infer the conclusion. The true explanation is to be found in the principle of relevancy. Any fact which is relevant to the issue constitutes evidence to go before the jury, and any fact, roughly speaking, is relevant between which and the fact to be proved there may be a connection as cause and effect. See EVIDENCE. When the question is what damages the plaintiff has sustained, the court openly undertakes to review their decision on its merits—although this is as much a question of fact as any other. If the court deems the damages excessive, it will order a new trial to take place,—generally adding the condition that the verdict may stand if the plaintiff will accept a reduced sum for damages, which in effect amounts to the court itself finding a verdict.

The function of the jury in libel cases was in the last century the subject of a celebrated controversy which ended in the passing of Fox's Libel Act in 1792. Lord Mansfield and the judges held that the criminality or innocence of an act done, including any paper written, is matter of law and not matter of fact, an undeniable proposition then and since. They had also been in the habit of directing the jury to consider only the question of publication, telling them that its guilt or innocence was not for them to decide. Fox's Act declares and enacts that the jury may give a general verdict of guilty or not guilty in libel cases, and shall not be required or directed by the court or judge to find a verdict of guilty on proof of publication and of the sense ascribed to it by the prosecution.

Of the merits of the institution little space is left to speak. The present English jury has at least one conspicuous defect in the requirement of unanimity; yet, so far as that is concerned, in practice it produces hardly any appreciable evil. All that Bentham and others have urged against it—the application of a kind of torture to force conviction on the minds of jurors, the indifference to veracity which the concurrence of unconvinced minds must produce in the public mind, the probability that jurors will disagree and trials be rendered abortive, and the absence of any reasonable security in the unanimous verdict that would not exist in the verdict of a majority—all this is undeniably true. Yet we rarely hear of juries disagreeing or of jurors agreeing under compulsion. When civil juries were established in Scotland, this was one of the arguments used against the experiment, but it has been stated by the judge, Mr. Commissioner Adam, under whom the system was started, that he only knew of one instance of disagreement during a period of twenty years. English experience is much the same, and a reform which twenty or thirty years ago was pronounced absolutely necessary by conservative jurists is now hardly ever heard of. Practically juries have no difficulty in coming to a unanimous verdict; and, if a guess may be hazarded on so wide a subject, they have probably less difficulty now than ever. One cause of that result may be the deference which juries invariably pay to the carefully suggested opinion of the judge—arising no doubt from such perfect confidence in the bench as did not always exist, and would not always have been deserved if it had existed.

But, apart from any incidental defects, it may be doubted whether, as an instrument for the investigation of truth, the jury deserves all the encomiums which have been passed upon it. In criminal cases, especially of the graver kind, it is perhaps the best tribunal that could be devised. There the element of moral doubt enters largely into the consideration of the case, and that can best be measured by a popular tribunal.

Opinion in England is unanimously against subjecting a man to serious punishment as a result of conviction before a judge sitting without a jury, and the judges themselves would be the first to deprecate so great a responsibility. But in civil causes, where the issue must be determined one way or the other on the balance of probabilities, a single judge would probably be a better tribunal than the present combination of judge and jury. Even if it be assumed that he would on the whole come to the same conclusion as a jury deliberating under his directions, he would come to it more quickly. Time would be saved in taking evidence, summing up would be unnecessary and the addresses of counsel would inevitably be shortened and concentrated on the real points at issue.

The Jury in Scotland.—According to the *Regiam Majestatem*, which is identical with the treatise of Glanvill on the law of England (but whether the original or only a copy of that work is a question which need not delay us), trial by jury existed in Scotland for civil and criminal cases from as early a date as in England, and there is reason to believe that at all events the system became established at a very early date. Its history was very different from that of the English jury system. In Scotland trial by jury survived for criminal trials, but became extinct in civil cases. In the criminal assize the jury has always consisted of fifteen persons chosen from the jury lists, general and special, drawn up by the Sheriff,—one-third of the jury being chosen from the special, and two-thirds from the general list. The verdict is to be that of the majority of the jury, and formerly it had to be expressed in writing, but may now be delivered *viva voce* by the chancellor or foreman. Besides the "guilty" or "not guilty" to which the English jury is restricted, a Scotch jury may bring in a verdict of "not proven," which has legally the same effect as "not guilty" in releasing the accused from further charge, while it practically inflicts upon him the stigma of moral guilt for the rest of his life.

The civil jury was reintroduced in Scotland by the Act 55 Geo. III. c. 42, mainly on account of the difficulty which Scotch appeals turning on questions of fact presented to the House of Lords. Originally the juries were appointed to try issues sent from the Court of Session under the direction of three lords commissioners, but afterwards the procedure by jury was united with the ordinary business of the court, and the special tribunal of commissioners was abolished. The jury was copied strictly from the English practice: the jurors are twelve in number, and their verdict must be unanimous. If they fail to agree within twelve (now six) hours, they must be discharged. This experiment was not at first popular, and it is doubtful if it has even now become assimilated to Scotch practice.

United States.—Trial by jury according to the English system has been incorporated into the constitution of the United States. There was at one time some controversy as to whether the civil jury was included or not. The three articles (III., V., and VI.) in which allusion to trial by jury is made refer to criminal proceedings only, and, moreover, the supreme court is declared to have appellate jurisdiction both as to law and *fact*. It has accordingly been provided by one of the amendments to the constitution that, in suits at common law where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved; and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law. "Throughout the Union in all trials, whether civil or criminal, unanimity in the jury is essential" (Forsyth, 344).

In France there is no grand jury, and no civil jury. The jury in a criminal case find their verdict by a majority. (E. R.)

JUSSIEU, De, the name of a distinguished French family, which came into prominent notice towards the close of the 16th century, and for a century and a half was illustrious for the botanists it produced. The following are its more eminent members.

I. Antoine de Jussieu (1686–1758), born at Lyons in 1686, was the earliest in point of time of the line of distinguished botanists of his name. He was the son of Christophe de Jussieu (or Dejussieu), an apothecary of some repute, who published a *Nouveau traité de la thériaque*, Trévoux, 1708. Antoine studied at the university of Montpellier, and travelled with his brother Bernard through Spain, Portugal, and southern France. He came to Paris in 1708, Tournefort, whom he succeeded, dying in that year. His own original publications are not of marked importance, but he edited an edition of Tournefort's *Institutiones rei herbariæ*, Paris, 1719, 3 vols. He performed a similar office for a posthumous work of Barrelier, *Plantæ per Galliam, Hispaniam, et Italiam observatæ*, etc., Paris, 1714. He practised medicine, chiefly devoting himself to the very poor. He died at Paris, 22d April, 1758.

II. Bernard de Jussieu (1699–1777), a younger brother of the above, was also born at Lyons, in 1699. He was educated for the medical profession, took his doctor's degree at Montpellier, and commenced practice in 1720, but his sensitive temperament hindered his prosecution of it, and on his brother's invitation he gladly joined him in Paris in 1722. He succeeded Vaillant as sub-demonstrator of plants in the Jardin du Roi, and his principal duties consisted in superintending the herborizations of the student. His knowledge of plants and even of non-botanical subjects was so great that he readily detected and named the component parts of made-up plants which were sometimes submitted to him. It is reported that at one of these excursions, whilst Linnæus was his guest, the students having brought some such counterfeit to be named by the young Swede, his reply was "Aut Deus, aut D. de Jussieu." In 1725 he brought out a new edition of Tournefort's *Histoire des plantes qui naissent aux environs de Paris*, in 2 vols., which was afterwards translated into English by John Martyn,—the original work being incomplete. In the same year he was admitted into the Académie des Sciences, and communicated several papers to that body. Long before Tremblay published his *Histoire des polypes d'eau douce*, he maintained the doctrine that these organisms were animals, and not the flowers of marine plants, then the current notion; and to confirm his views he made three journeys to the coast of Normandy. Singularly modest and retiring, he published very little, but in 1759 he arranged the plants in the royal garden of the Trianon at Versailles, according to his own scheme of classification. This arrangement is printed in his nephew's *Genera*, pp. lxiii.–lxx., and formed the basis of that work. He cared little for the credit of enunciating new discoveries, so long as the facts themselves were made public. On the death of his brother Antoine, he could not be induced to succeed him in his office, but prevailed upon Lemonnier to assume the higher position. He died at Paris, 6th November, 1777.

III. Joseph de Jussieu (1704–1779), brother of Antoine and Bernard, was born at Lyons, 3d September, 1704. Educated like the rest of the family for the medical profession, he accompanied La Condamine to Peru, in the expedition for measuring an arc of meridian, and remained in South America for thirty-six years, returning to France in 1771. His health having previously failed, his works were never printed, and remain in manuscript. During his long absence, he was a member of the Académie des Sciences, although for thirty-five years he never came near the place where that body held its deliberations. Amongst the seeds he sent to Bernard were those of *Heliotropium peruvianum*, Linn., then first introduced into Europe. He died at Paris, 11th April, 1779.

IV. Antoine Laurent de Jussieu (1748–1836), nephew of the three preceding, was born at Lyons on 12th April, 1748. Called to Paris by his uncle Bernard, and carefully trained by him for the pursuits of medicine and botany, he largely profited by the opportunities afforded him. Gifted with a tenacious memory, and the power of quickly grasping the salient points of subjects under observation, he steadily worked at the improvement of that system of plant-arrangement which had been sketched out by his uncle. In 1789 was issued his *Genera plantarum secundum ordines naturales disposita, juxta methodum in horto regio Parisiensi exaratam, anno* MDCCLXXIV, Paris, 8vo. The influence of this volume is briefly noticed in the

article BOTANY, vol. iv. p. 71; it formed the foundation on which modern classification was afterwards built; more than this, it is certain that Cuvier derived much help in his zoological classification from its perusal. Hardly had the last sheet passed through the press, when the French Revolution broke out, and the author was installed in charge of the hospitals of Paris. The Muséum d'Histoire Naturelle was organized on its present footing mainly by him in 1793, and he selected for its library everything relating to natural history from the vast materials obtained from the convents then broken up. He continued as professor of botany there from 1770 to 1826, when his son Adrien succeeded him. Besides the *Genera*, he produced nearly sixty memoirs on botanical topics. He died at Paris, 17th September, 1836.

V. ADRIEN (LAURENT HENRI) DE JUSSIEU (1797–1853), son of Antoine Laurent, was born at Paris, 23d December, 1797. Although his youth was delicate, he displayed the qualities of his family in his thesis for the degree of M.D., *De Euphorbiacearum generibus medicisque earundem viribus tentamen*, Paris, 1824. He was also the author of valuable contributions to botanical literature on the *Rutaceæ*, *Meliaceæ*, and *Malpighiaceæ* repectively, of "Taxonomie" in the *Dictionnaire universelle d'histoire naturelle*, and of an introductory work styled simply *Botanique*, which reached nine editions, and has been translated into the principal languages of Europe. He also edited his father's *Introductio in historiam plantarum*, issued at Paris, without imprint or date, it being a fragment of the intended second edition of the *Genera*, which Antoine Laurent did not live to complete. He died at Paris, 29th June, 1853, leaving two daughters, but no son, so that with him closed the brilliant botanical dynasty.

VI. LAURENT (PIERRE) DE JUSSIEU (1792–1866). This miscellaneous writer, nephew of Antoine Laurent, was born at Villeurbanne, 7th February, 1792. *Simon de Nantua, ou le marchand forain*, Paris, 1818, reached fifteen editions, and has been translated into seven languages. He also wrote *Simples notions de physique et d'histoire naturelle*, Paris, 1857, and a few geological papers. He died in 1866.

JUSTICE, in law, has long been the official title of the judges of two of the English superior courts of common law, and it is now extended to all the judges in the Supreme Court of Judicature—a judge in the High Court of Justice being styled Mr. Justice, and in the Court of Appeal Lord Justice. Before the Judicature Act the Queen's Bench and the Common Pleas were each presided over by a lord chief justice, and the lord chief justice of the Queen's Bench was nominal head of all the three courts, and held the title of Lord Chief Justice of England. The titles of Lord Chief Justice of the Common Pleas and Lord Chief Baron have recently been abolished, and all the common law divisions of the High Court are united into the Queen's Bench division, the president of which is the lord chief justice of England.

The lord chief Justice of England or of the Queen's Bench traces his descent from the justiciar of the Norman kings. This officer appears first as the lieutenant or deputy of the king, exercising all the functions of the regal office in the absence of the sovereign. "In this capacity William Fitz-Osbern, the steward of Normandy, and Odo of Baycux, acted during the Conqueror's visit to the Continent in 1067; they were left, according to William of Poitiers, the former to govern the north of England, the latter to hold rule in Kent, *vice sua;* Florence of Worcester describes them as "custodes Angliæ," and Ordericus Vitalis gives to their office the name of "præfectura." It would seem most probable that William Fitz-Osbern at least was left in his character of steward, and that the Norman seneschalship was thus the origin of the English justiciarship," Stubbs's *Constitutional History*, vol. i. p. 346. The same authority observes that William of Warenne and Richard of Bienfaite, who were left in charge of England in 1074, are named by a writer in the next generation "præcipui Angliæ justitiarii"; but he considers the name to have not yet been definitely attached to any particular office, and that there is no evidence to show that officers appointed to this trust exercised any functions at all when the king was at home, or in his absence exercised supreme judicial authority to the exclusion of other high officers of the court. The office became permanent in the reign of William Rufus, and in the hands of Ranulf Flambard it became coextensive with the supreme powers of government. For some time, however, the title of justiciar seems not to have been definitely appropriated to this high minister. Judges of the curia regis were occasionally so named, and it was not till the reign of Henry II. that the chief officer of the crown acquired the exclusive right to the title of *capitalis* or *totius Angliæ justitiarius*. Canon Stubbs considers that the English form of the office is to be accounted for by the king's desire to prevent the administration falling into the hands of an hereditary noble. The early justiciars were clerics, in whom the possession of power could not become hereditary. The justiciar continued to be the chief officer of state, next to the king, until the fall of Hubert de Burgh (in the reign of King John), described by Mr. Stubbs as the last of the great justiciars. Henceforward, according to Mr. Stubbs, the office may be regarded as virtually extinct, or it may be said to have survived only in the judicial functions, which were merely part of the official character of the chief justiciar. He was at the head of the curia regis, which was separating itself into the three historical courts of common law about the time when the justiciarship was falling from the supreme place. The chancellor took the place of the justiciar in council, the treasurer in the exchequer, while the two offshots from the curia regis, the Common Pleas and the Exchequer, received chiefs of their own. The Queen's Bench represented the original stock of the curia regis, and its chief justice the great justiciar. The justiciar may therefore be said to have become from a political a purely judicial officer. A similar development awaited his successful rival the chancellor.

The lord chief justice is, next to the lord chancellor, the highest judicial dignitary in the kingdom. The office is generally the prize of the chief law officer of the Government, and political considerations, therefore, enter largely into the appointment. But the chief justices have been generally worthy of their great position. The list of them contains the names of some of the greatest masters of the common law, among whom pre-eminent rank must be assigned to Hale, Coke, Holt, Mansfield, and Cockburn. Lord Campbell has written the *Lives of the Chief Justices*, in 3 vols. A list of the lords chief justices will be found in Haydn's *Book of Dignities*, 1851. Robert de Brus, said by Fox to be the first judge who took the distinctive title of lord chief justice of the King's Bench (1268), was the grandfather of Robert the Bruce, king of Scotland.

In the United States the supreme court consists of a chief justice and eight associate justices, any five of whom make a quorum. The salary of the chief justice is $10,500, and that of the associates $10,000.

JUSTICE OF THE PEACE is an inferior magistrate appointed in England by special commission under the great seal to keep the peace within the county for which he is appointed. "The whole Christian world," said Lord Coke, "hath not the like office as justice of the peace if duly executed." Lord Cowper, on the other hand, describes them as "men sometimes illiterate and frequently bigoted and prejudiced." The truth is that the justices of the peace perform without any other reward than the consequence they acquire from their office a large amount of work indispensable to the administration of the law, and for the

most part they discharge their duties with becoming good sense and impartiality. But being chosen from the limited class of country gentlemen in counties, they are sometimes exposed to the suspicion of the general public, particularly when they have to administer laws which are considered to confer special privileges on their own class. Further, as they do not generally possess a professional knowledge of the law, their decisions are occasionally inconsiderate and ill-informed. In great centres of population, when the judicial business of justices is heavy, it has been found necessary to appoint paid justices or stipendiary magistrates to do the work, and an extension of the system to the country districts has been often advocated.

The commission of the peace is addressed to all the justices of the county, and assigns to them the duty of keeping and causing to be kept all ordinances and statutes for the good of the peace and for preservation of the same, and for the quiet rule and government of the people, and further assigns "to you and every two or more of you (of whom any one of the aforesaid A, B, C, D, etc., we will, shall be one) to inquire the truth more fully by the oath of good and lawful men of the county of all and all manner of felonies, poisonings, enchantments, sorceries, arts, magic, trespasses, forestallings, regratings, engrossings, and extortions whatever." This part of the commission is the authority for the jurisdiction of the justices in *sessions*. Justices named specially in the parenthetical clause are said to be on *the quorum*. Justices cannot act beyond the limits of the county for which they are appointed, and the warrant of a justice cannot be executed out of his county unless it be backed, that is, endorsed by a justice of the county in which it is to be carried into execution. A justice improperly refusing to act on his office, or acting partially and corruptly, may be proceeded against by a criminal information, and a justice refusing to act may be compelled to do so by the High Court of Justice. An action will lie against a justice for any act done by him in excess of his jurisdiction, and for any act within his jurisdiction which has been done wrongfully and with malice, and without reasonable or probable cause. But no action can be brought against a justice for a wrongful conviction until it has been quashed. By 18 Geo. II. c. 20 every justice for a county must have an estate of freehold, copyhold, or customary tenure in fee, for life or a given term, of the yearly value of £100. The vast and multifarious duties of the justices cover some portion of every important head of the criminal law, and extend to a considerable number of matters relating to the civil law. A complete guide thereto is Burn's *Justice of the Peace*, in 5 large volumes, the thirtieth edition of which was published in 1869.

In the United States these officers are sometimes appointed by the executive, sometimes elected. "In some, perhaps all, of the United States, justices of the peace have jurisdiction in civil cases given to them by local regulations" (Bouvier's *Law Dictionary*).

JUSTICIARY, High Court of, in Scotland, is the supreme criminal court, and consists of five of the lords of session together with the lord justice-general and the lord justice-clerk as president and vice-president respectively. The constitution of the court is settled by the Act 1672, c. 16. The lords of justiciary hold circuits regularly twice a year according to the ancient practice, which, however, had been allowed to fall into disuse until revived in 1748. The circuits are—the south, at the towns of Jedburgh, Dumfries, and Ayr; west (three times a year), at Glasgow, Inveraray, and Stirling; and north, Perth, Aberdeen, Dundee, and Inverness. By a recent order in council the number of circuit courts in future is to be doubled. Two judges generally go on circuit, and in Glasgow they are by special statute authorized to sit in separate courts. The High Court, sitting in Edinburgh, has, in addition to its general jurisdiction, an exclusive jurisdiction for districts not within the jurisdiction of the circuits—the three Lothians, and Orkney and Shetland. The High Court also takes up points of difficulty arising before the special courts, like the court for crown cases reserved in England. The court of justiciary has authority to try all crimes, unless when its jurisdiction has been excluded by special enactment of the legislature. It is also stated to have an inherent jurisdiction to punish all criminal acts, even if they have never before been treated as crimes. Its judgments are believed to be not subject to any appeal or review, but it may be doubted whether an appeal on a point of law would not lie to the House of Lords. The following crimes must be prosecuted in the court of justiciary:—treason, murder, robbery, rape, fire-raising, deforcement of messengers, breach of duty by magistrates, and all offences for which a statutory punishment higher than imprisonment is imposed.

JUSTIN, Martyr and Apologist as he is usually called, was an able and eloquent advocate of Christianity in the 2d century. Almost all we know about him is told us in his own writings. He was born in Palestine, at Flavia Neapolis (*Apol.*, i. 1), the ancient Shechem, now Nábulus. The names of his father Priscus and grandfather Bacchius suggest that he was of Latin descent, and some passages in his writings seem to say that his parents were heathens. He relates his own conversion in two passages. In the one he says that he was drawn to Christianity because he saw the Christians dauntless in death (*Apol.*, ii. 12); in the other he tells how chance intercourse with an aged stranger brought him to know the truth (*Dial. c. Tryph.*, c. 2), but this passage may be allegorical. In the introduction to the dialogue with Trypho, Justin describes various systems of pagan philosophy and his relation to them. At first he associated with the Stoics; from them he went to a Peripatetic, then to a Pythagorean; and at length he embraced the doctrines of Platonism. His Platonism clung to him through life, and curiously colored many of his Christian speculations. We know little about Justin's life after his conversion. It is very probable that he retained his philosopher's cloak, the distinctive badge of the wandering and professional teacher of philosophy, and went about from place to place discussing the truths of Christianity in the hope of bringing educated pagans, as he himself had been brought, through philosophy to Christ. At Ephesus he held the famous disputation with Trypho the Jew, and in Rome he argued with Crescens the Cynic. If the *Cohortatio* be genuine, he also visited Alexandria and Cumæ. His martyrdom is well authenticated. In his second *Apology* Justin declares that he expected martyrdom, and that he believed that his opponent Crescens, silenced in public by his arguments, would do his best to get him thrown into prison and condemned to death; and this declaration is probably the reason why Eusebius, who often manufactures facts out of suppositions, asserts that Justin was slain through the plots of Crescens. An old martyrium, of unknown authorship, records the trial and death of a Justin, who is probably Justin Martyr, though there is no corroborative historical evidence. If the account can be accepted, Justin was brought before Rusticus, a Roman magistrate who was a Stoic; during his trial he was brave, quiet, and dignified: he professed his faith in the God of heaven and earth, and in His Son "the Master of Truth," and confidently expressed the conviction that after death he would share a blessed immortality. He was condemned and put to death on the same day. We cannot fix with any certainty the dates of Justin's birth and death. He was probably born near the beginning of the 2d century, and was martyred somewhere between 148 and 165.

Justin was one of the earliest and ablest of the Christian Apologists, and it is as an apologist rather than as a theologian that he must be criticized, for his *Apologies* did not lead him directly to exhibit and de-

fend the truths of Christianity. He was defending Christians, not Christianity. Trajan had formally authorized the persecution of the Christians. Hadrian and Antoninus Pius had done nothing to put this decree in operation, but it hung over the Christian church, and might have been put in force at any moment. The Christians were legally proscribed. This was the state of matters which gave rise to Justin's *Apologies*. He wrote like a man full of Christianity; it was his philosophy, his religion, his rule of daily life. And he wrote boldly, having nothing to fear and nothing to conceal. The argument of his first *Apology*, addressed to the emperor Antoninus Pius, may be thus condensed. "In the name of these unjustly hated and much abused men, I, Justin, one of themselves, present to you this discourse and petition. You are everywhere called the Pious, the guardian of justice, the friend of truth; your acts shall show whether you merit these titles. My design is neither to flatter you by this letter nor to win your favor. Judge us by a scrupulous and enlightened equity, not by mere presumption, nor in the name of superstition, nor by the persuasion of calumny; . . . . we fear no harm if we are not guilty of any crime. You can kill, you cannot injure us. All that we ask for is investigation; if the charges made against us are true, let us be punished. . . . Our duty is to make our deeds and doctrines fully known; yours is to investigate our cause and to act as good judges." Justin then proceeds to set forth the iniquity of the summary modes of trial in use against the Christians, and goes on to state and deal with the charges brought against his brethren. These were three: the Christians were denounced as atheists, as rebels, and as evil-doers—faithless to God, the emperor, and society. Justin answers, "We are atheists, if it be atheism not to acknowledge your gods; but we hold this glorious atheism in common with Socrates, who was martyred for it as we are; we are no atheists, for we worship the God of truth, the Father of righteousness, of wisdom, and of all virtues. We are no rebels: the kingdom founded by Jesus is purely spiritual, and need be no cause of alarm to the emperors; we worship God only, but with this exception we joyfully obey you and acknowledge you as our princes and governors. So far from our being rebels, our religion helps true and good government; men may always hope to elude human law, but they cannot hope to escape God, who sees and knows all things. We are no criminals: the Crucified One whom we worship is the Divine Word, living truth, and has enjoined us to live holy and pure lives." Justin contrasts pagan morals and the Christian life, the pagan deities and Jesus of Nazareth. The empire and Christianity were at war because of the persecuting edicts of the emperors, and Justin has no doubt that Christianity must in the end win the day. The *Apology* ends with solemn dignity: "If this doctrine appears true and reasonable give heed to it; if not, treat it as of no value. But do not condemn men to death who have done you no wrong; for we declare to you that you will not escape the judgment of God if you persist in injustice. For ourselves, we have but one cry—'The will of God be done.'" In the dialogue with Trypho, Justin endeavored to show the truth of Christianity from the Old Testament Scriptures, and he described the New Testament as the new law which superseded, while it fulfilled, the old. It is not possible to construct a scheme of Christian dogmatic from the writings of Justin, but some ideas may be gathered from his *Apologies*. Christ is the centre of religion, and the exposition of Christian doctrine is to be grouped around a description of Christ. God is the God and Father of Jesus Christ. He is the *only* and the *one* God in opposition to the polytheism of the heathen; the *unbegotten* God, not born and reared like Dionysus the son of Semele or Apollo son of Leto; the *unspeakable* God, because every thinking man knows that God's existence cannot be thought of or described. God is spiritual; He has indescribable glory and shape: He is omniscient and almighty; He is creator; He has made the world for man, and cares for His creatures; He is full of mercy and goodness. With Justin the great fact in Christianity is that Jesus Christ is the Son of God; he does not spend much time in thinking out what this means, but he is one of the earliest writers who unconsciously tries to explain the incarnation by the Platonic thought of the Logos. Justin, however, thinks of the Logos as a personal being. The begetting of the Logos is an act of the Father's; but we cannot say when the Logos was begotten, because He was before all creation, and so before all time. The Logos is the instrument through whom God created and preserves the universe; He is the instrument in the miraculous history of the Jews; He inspired the heathen sages; He is God; He became incarnate. Justin does not seem to distinguish between the divine and human natures of Christ, but he believes Christ to be man and to be God. And so on with other doctrines. In Justin we see the earnest living Christianity of the 2d century firmly centred on Jesus Christ, very God and very man, trying to live again His life, taught by His Spirit. The faith rested in the great central facts of Christianity, but the power of defining doctrine had not become vigorous.

No ancient writer gives a complete list of Justin's writings; the fullest is that of Eusebius (*Eccl. Hist.*, iv. 18). The following, now extant, have been ascribed to him:—The two *Apologies; Dialogue with the Jew Trypho; A Speech to the Greeks; An Address to the Greeks; On the Sole Government of God; An Epistle to Diognetus; Fragments on the Resurrection;* and other fragments. The following, now extant, and attributed to Justin, are deemed spurious:—The *Exposition of the True Faith; Epistle to Zenas and Serenus; A Refutation of Certain Doctrines of Aristotle; Questions and Answers to the Orthodox; Questions of Christians to Heathens; Questions of Heathens to Christians.*

The *First Apology* is undoubtedly genuine. It refers to the Jewish rebellion, 131–136, and was probably written 138–140 A.D. The *Second Apology* which has come down to us is probably not the second apology mentioned by Eusebius, which has been lost, but a portion of the first. The authenticity of the *Dialogue with Trypho* has been disputed by Lange, Koch, Wettstein, etc., but their arguments are not convincing; more interest attaches to the question whether it is historical or written in imitation of the dialogues of Plato; the greater weight of evidence lies on the side that it is historical. The *Speech to the Greeks* is probably Justin's; but the weight of evidence is against the authenticity of the remaining writings.

Editions.—Robert Stephanus, Paris, 1551; Sylburg, Heidelberg, 1593; Morell, Paris, 1615; Maran, Paris, 1742. The best edition is Otto's, 3d ed., Jena, 1876, and following years.

Good translations of Justin have appeared in the Oxford *Library of the Fathers*, and in Clarke's *Ante-Nicene Library*.

Full information about Justin's history and views may be had from Otto, *De Justini Martyris Scriptis et Doctrina*, Jena, 1841; and from Donaldson's *History of Christian Literature and Doctrine*, London, 1866, vol. ii. For information about MSS., see Donaldson, p. 144, and Otto's prefaces. Otto refers, ii. p. xxvi., to a *Codex Glascoviensis*, but this is a mistake; the MS. referred to contains the orations of an Italian humanist, Justiniani. (T. M. L.)

JUSTIN, Latin historian, called in one MS. Justinus Frontinus, in another M. Junianus Justinus, in others simply Justinus, is known from his *Historiarum Philippicarum Libri XLIV.*, a work described by himself in his preface as a collection of the most important and interesting passages from the voluminous *Historiæ Philippicæ et totius Mundi Origines et Terræ Situs*, written in the time of Augustus by Trogus Pompeius. Of Justin's personal history absolutely nothing is known. The passage in his preface on which was based the belief that he lived under Antoninus Pius is spurious; but a reference to him by St. Jerome fixes his date at some point before the 5th century. The work of Trogus is lost, probably helped into oblivion by the shorter compilation; but the *prologi*, or arguments, of the forty-four books are extant, and a few fragments of the text are preserved by

Pliny and other writers. From the *prologi* we gather that, although the main theme of Trogus was the rise and history of the Macedonian monarchy, he yet permitted himself a freedom of digression that extended very considerably the field of description, and makes it all the more to be regretted that Justinus chose to write a capricious anthology (*breve veluti florum corpusculum*) instead of a regular epitome of the work. As it stands, however, Justin's history contains a large amount of valuable information, which but for it we might never have possessed. The style, though far from perfect, has the merit of clearness, occasionally even of elegance.

The editio princeps of Justinus appeared at Venice, 1470, folio, from Jenson's press. An edition, folio, Rome, is referred to 1470 or 1471. The other chief editions are those of Sabellicus, Venice, folio, 1490, 1497, and 1507; Aldus, Venice, 8vo, 1522; Bongarsius, Paris, 8vo, 1581; Grævius, Leyden, 8 vo, 1683; Hearne, Oxford, 8vo, 1705; Gronovius, Leyden, 1719 and 1760 (2d ed. in "Variorum" Classics); Frotscher, Leipsic, 8vo, 3 vols., 1827–30; Dübner, Leipsic, 8vo, 1831; and Dübner and Johanneau, Paris, 2 vols., 1838. Translations appeared very early in the chief European languages. There are English versions by Goldinge, 1564; Holland, 1606; Codrington, 1654; Brown, 1712; Bailey, 1732; Clarke, 1732; Turnbull, 1746; and Watson, 1853.

JUSTIN I., the elder, Roman emperor of the East from 518 to 527, was originally a Dacian peasant; but, enlisting under Leo I. he rose by his size and strength to be commander of the imperial guards of Anastasius. On the death of that Emperor in 518, the wily Dacian, aged sixty-eight, used for his own election to the throne a sum of money that he had received for the support of another candidate. Though ignorant even of the rudiments of letters, Justin was sufficiently acute, and he was sensible enough to entrust the administration of state to his wise and faithful quæstor Proclus, though his own experience dictated several improvements in military affairs. An orthodox churchman himself, he effected in 519 a reconciliation of the Eastern and Western Churches, after a schism of thirty-five years (see HORMISDAS). The assassination of the orthodox general Vitalian, and the virulence of the bloody conflicts of the "blue" and "green" factions that convulsed the capital towards the end of Justin's reign, are attributed to the jealousy and intrigues of the emperor's nephew and successor Justinian. In 522 a war broke out with Persia, in which Belisarius made his first historical appearance; it continued for some years without any definite results. In 522 also Justin ceded to Theodoric, the Gothic king of Italy, the right of naming the consuls, and in 525 he received from that Arian monarch a deputation, of which the pope, John I., was compelled to be the leader, to deprecate an edict issued by Justin in 523 against all heretics. On April 1, 527, Justin, at the request of the senate, assumed Justinian as his colleague, and on the 1st of the following August he died. Justin bestowed much care on the repairing of public buildings throughout his empire, and contributed large sums to repair the damage caused by a destructive earthquake at Antioch.

JUSTIN II., the younger, Roman emperor of the East from 565 to 578, was the nephew and successor of Justinian I. He availed himself of his influence as master of the palace, and as husband of Sophia, the niece of the late empress Theodora, to secure a peaceful election. The first few days of his reign—when he paid his uncle's debts, administered justice in person, and proclaimed universal religious toleration—gave bright promise, realization of which was prevented either by his feebleness or his caprice. The most important event of his reign was the invasion of Italy by the Lombards, who, entering in 568 under Alboin, in a few years made themselves masters of nearly the entire country. The common story that they were invited by the superseded and insulted exarch Narses, besides being inherently improbable, has but slender historical foundation. Modern historians see in the event only an evidence of the indifference of the Byzantine court to Italy, whence little revenue could be drawn. Justin's arrogance had insulted the embassies from the Persians and Avars, who had come to him in the first year of his reign; and in 572 war broke out with the former, and in 573 with the latter. Although he formed alliances with the Turks of Central Asia and with the Ethiopians of Arabia in the one case, and with the Austrasian Franks in the other, the emperor's arms were unsuccessful in both wars. The temporary fits of insanity into which he fell warned him to name a colleague. Passing over his own relatives, he raised, on the advice of Sophia, the brave general Tiberius to be Cæsar in December, 574, and withdrew for his remaining years into retirement. Tiberius was advanced to the dignity of Augustus on September 26, 578, and Justin died on the 5th of the following month.

JUSTINIAN I. (483–565). Flavius Anicius Justinianus, surnamed the Great, the most famous of all the emperors of the Eastern Roman empire, was by birth a barbarian, native of a place called Tauresium in the district of Dardania, a region of Illyricum,[1] and was most probably born on May 11, 483. His family has been variously conjectured, on the strength of the proper names which its members are stated to have borne, to have been Teutonic or Slavonic. The latter seems the more probable view. His own name was originally Uprauda. Justinianus was a Roman name which he took from his uncle Justin who adopted him, and to whom his advancement in life was due.[2] Of his early life we know nothing except that he came to Constantinople while still a young man, and received there an excellent education. Doubtless he knew Latin before Greek; it is alleged that he always spoke Greek with a barbarian accent. When Justin ascended the throne in 518 A.D., Justinian became at once a person of the first consequence, guiding especially in church matters, the policy of his aged, childless, and ignorant uncle, receiving high rank and office at his hands, and soon coming to be regarded as his destined successor. On Justin's death in 527, having been a few months earlier associated with him as co-emperor, he succeeded without opposition to the throne.

His reign was filled with great events, both at home and abroad, both in peace and in war. They may be classed under four heads:—(1) his legal reforms; (2) his administration of the empire; (3) his ecclesiastical policy; and (4) his wars and foreign policy generally.

1. It is as a legislator and codifier of the law that Justinian's name is most familiar to the modern world; and it is therefore this department of his action that requires to be most fully dealt with here. He found the law of the Roman empire in a state of great confusion. It consisted of two masses, which were usually distinguished as old law (*jus vetus*) and new law (*jus novum*). The first of these comprised: (1) all such of the statutes (*leges*) passed under the republic and early empire as had not become obsolete: (2) the decrees of the senate (*senatus consulta*) passed at the end of the republic and during the first two centuries of the empire; (3) the writings of the jurists of the later republic and of the empire, and more particularly of those jurists to whom the right of declaring the law with authority (*jus respondendi*) had been committed by the emperors. As these jurists had in their commentaries upon the *leges senatus consulta* and edicts of the magistrates practically incorporated all that was of importance in those documents, the books of the jurists may substantially be taken as including (1) and (2). These writings were of course very numerous, and formed a vast mass of literature. Many of them had become exceedingly scarce—many having of course

[1] It is commonly identified with the modern Giustendil, but Uskiub (the ancient Skupi) has also been suggested. See Tozer, *Highlands of European Turkey*, ii. p. 370.

[2] The name "Uprauda" itself is said to be derived from the word "prauda," which in Old Slavic means "jus," "justitia," the prefix being simply a breathing frequently attached to Slavonic names.

been altogether lost. Some were of doubtful authenticity. They were so costly that no person of moderate means could hope to possess any large number; even the public libraries had nothing approaching to a complete collection. Moreover, as they proceeded from a large number of independent authors, who wrote expressing their own opinions, they contained many discrepancies and contradictions, the dicta of one writer being controverted by another, while yet both writers might enjoy the same formal authority. A remedy had been attempted to be applied to this evil by a law of the emperor Theodosius II. and Valentinian III., which gave special weight to the writings of five eminent jurists (Papinian, Paulus, Ulpian, Modestinus, Gaius); but it was very far from removing it. As regards the *jus vetus*, therefore, the judges and practitioners of Justinian's time had two terrible difficulties to contend with,—first, the bulk of the law, which made it impossible for any one to be sure that he possessed anything like the whole of the authorities bearing on the point in question, so that he was always liable to find his opponent quoting against him some authority for which he could not be prepared; and, secondly, the uncertainty of the law, there being a great many important points on which differing opinions of equal legal validity might be cited, so that the practising counsel could not advise, nor the judge decide, with any confidence that he was right, or that a superior court would uphold his view.

The new law (*jus novum*), which consisted of the ordinances of the emperors promulgated during the middle and later empire (*edicta*, *rescripta*, *mandata*, *decreta*, usually called by the general name of *constitutiones*), was in a condition not much better. These ordinances or constitutions were extremely numerous. No complete collection of them existed, for although two collections (*Codex Gregorianus* and *Codex Hermogenianus*) had been made by two jurists in the 4th century, and a large supplementary collection published by the emperor Theodosius II. in 438 (*Codex Theodosianus*, these collections did not include all the constitutions; there were others which it was necessary to obtain separately, but many whereof it must have been impossible for a private person to procure. In this branch too of the law there existed some, though a less formidable, uncertainty; for there were constitutions which practically, if not formally, repealed or superseded others without expressly mentioning them, so that a man who relied on the words of one constitution might find that it had been varied or abrogated by another he had never heard of or on whose sense he had not put such a construction. It was therefore clearly necessary with regard to both the older and the newer law to take some steps to collect into one or more bodies or masses so much of the law as was to be regarded as binding, reducing it within a reasonable compass, and purging away the contradictions or inconsistencies which it contained. The evil had been long felt, and reforms apparently often proposed, but nothing (except by the compilation of the *Codex Theodosianus*) had been done till Justinian's time. Immediately after his accession, in 528, he appointed a commission to deal with the imperial constitutions (*jus novum*), this being the easier part of the problem. The commissioners, ten in number, were directed to go through all the constitutions of which copies existed, to select such as were of practical value, to cut these down by retrenching all unnecessary matter, and gather them, arranged in order of date, into one volume, getting rid of any contradictions by omitting one or other of the conflicting passages.[1] These statute law commissioners, as one may call them, set to work forthwith, and completed their task in fourteen months, distributing the constitutions which they placed in the new collection into ten books, in general conformity with the order of the Perpetual Edict as settled by Salvius Julianus and enacted by Hadrian. By this means the bulk of the statute law was immensely reduced, its obscurities and internal discrepancies in great measure removed, its provisions adapted by the abrogation of what was obsolete, to the circumstances of Justinian's own time. This *Codex Constitutionum* was formally promulgated and enacted as one great consolidating statute in 529, all imperial ordinances not included in it being repealed at one stroke.

The success of this first experiment encouraged the emperor to attempt the more difficult enterprise of simplifying and digesting the older law contained in the treatises of the jurists. Before entering on this, however, he wisely took the preliminary step of settling the more important of the legal questions as to which the older jurists had been divided in opinion, and which had therefore remained sources of difficulty, a difficulty aggravated by the general decline, during the last two centuries, of the level of forensic and judicial learning. This was accomplished by a series of constitutions known as the "Fifty Decisions" (*Quinquaginta Decisiones*), along with which there were published other ordinances amending the law in a variety of points, in which old and now inconvenient rules had been suffered to subsist. Then in December, 530, a new commission was appointed, consisting of sixteen eminent lawyers, of whom the president, the famous Tribonian (who had already served on the previous commission), was an exalted official (*quæstor*), four were professors of law, and the remaining eleven practising advocates. The instructions given to them by the emperor were as follows:—they were to procure and peruse all the writings of all the authorized jurists (those who had enjoyed the *jus respondendi*); were to extract from these writings whatever was of most permanent and substantial value, with power to change the expressions of the author wherever conciseness or clearness would be thereby promoted, or wherever such a change was needed in order to adapt his language to the condition of the law as it stood in Justinian's time; were to avoid repetitions and contradictions by giving only one statement of the law upon each point; were to insert nothing at variance with any provisions contained in the *Codex Constitutionum*; and were to distribute the results of their labors into fifty books, subdividing each book into titles, and following generally the order of the Perpetual Edict.[2]

These directions were carried out with a speed which is surprising when we remember not only that the work was interrupted by the terrible insurrection which broke out in Constantinople, in January, 532, and which led to the temporary retirement from office of Tribonian, but also that the mass of literature which had to be read through consisted of no less than two thousand treatises, comprising three millions of sentences. The commissioners, who had for greater despatch divided themselves into several commitees, presented their selection of extracts to the emperor, in 533, and he published it as an imperial statute on December 16th of that year, with two prefatory constitutions (those known as *Omnem reipublicæ* and *Dedit nobis*). It is the volume which we now call the *Digest* (*Digesta*) or *Pandects* (Πάνδεκται), and which is by far the most precious monument of the legal genius of the Romans, and indeed, whether one regards the intrinsic merits of its substance or the prodigious influence it has exerted and still exerts, the most remarkable law-book that the world has seen. The extracts comprised in it are 9123 in number, taken from thirty-nine authors, and are of greatly varying length, mostly only a few lines long. About one-third (in quantity) come from Ulpian, a very copious writer; Paulus stands next. To each extract there is prefixed the name of the author, and of the treatise whence it is taken.[3]

[1] See, for an account of the instructions given to the commission, the constitution *Hæc Quæ*, prefixed to the revised *Codex* in the *Corpus Juris Civilis*.

[2] See the constitution *Deo Auctore* (*Cod.* I. 17, 1).

[3] In the Middle Ages people used to cite passages by the initial words; and the Germans do so still, giving, however, the number

The worst thing about the *Digest* is its highly unscientific arrangement. The order of the Perpetual Edict, which appears to have been taken as a sort of model for the general scheme of books and titles, was doubtless convenient to the Roman lawyers from their familiarity with it, but was in itself rather accidental and historical than logical. The disposition of the extracts inside each title was still less rational; it has been shown by a modern jurist to have been the result of the way in which the committees of the commissioners worked through the books they had to peruse.[1] In enacting the *Digest* as a law book, Justinian repealed all the other law contained in the treatises of the jurists (that *jus vetus* which has been already mentioned), and directed that those treatises should never be cited in future even by way of illustration; and he of course at the same time abrogated all the older statutes, from the Twelve Tables downwards, which had formed a part of the *jus vetus*. This was a necessary incident of his scheme of reform. But he went too far, and indeed attempted what was impossible, when he forbade all commentaries upon the *Digest*. He was obliged to allow a Greek translation to be made of it, but directed this translation to be exactly literal.

These two great enterprises had substantially despatched Justinian's work; however, he, or rather Tribonian, who seems to have acted both as his adviser and as his chief executive officer in all legal affairs, conceived that a third book was needed, viz., an elementary manual for beginners which should present an outline of the law in a clear and simple form. The little work of Gaius, most of which we now possess under the title of *Commentarii Institutionum*, had served this purpose for nearly four centuries; but much of it had, owing to changes in the law, become inapplicable, so that a new manual seemed to be required. Justinian accordingly directed Tribonian, with two coadjutors, Theophilus, professor of law in the university of Constantinople, and Dorotheus, professor in the great law school at Beyrout, to prepare an elementary text-book on the lines of Gaius. This they did while the *Digest* was in progress, and produced the useful little treatise which has ever since been the book with which students commonly begin their studies of Roman law, the *Institutes of Justinian*. It was published as a statute with full legal validity shortly before the *Digest*. Such merits as it possesses—simplicity of arrangement, clearness and conciseness of expression—belong rather to Gaius, who has been closely followed wherever the alterations in the law had not made him obsolete, than to Tribonian. However, the spirit of that great legal classic seems to have in a measure dwelt with and inspired the inferior men who were recasting his work; the *Institutes* is better both in Latinity and in substance than we should have expected from the condition of Latin letters at that epoch, better than the other laws which emanate from Justinian.

In the four years and a half which elapsed between the publication of the *Codex* and that of the *Digest*, many important changes had been made in the law, notably by the publication of the "Fifty Decisions," which settled many questions that had exercised the legal mind and given occasion to intricate statutory provisions. It was therefore natural that the idea should present itself of revising the *Codex*, so as to introduce these changes into it, for by so doing, not only would it be simplified, but the one volume would again be made to contain the whole statute law, whereas now it was necessary to read along with it the ordinances issued since its publication. Accordingly another commission was appointed, consisting of Tribonian with four other coadjutors, full power being given them not only to incorporate the new constitutions with the *Codex* and make in it the requisite changes, but also to revise the *Codex* generally, cutting down or filling in wherever they thought it necessary to do so. This work was completed in a few months; and in November, 534, the revised *Codex* (*Codex repetitæ prælectionis*) was promulgated with the force of law, prefaced by a constitution (*Cordi nobis*) which sets forth its history, and declares it to be alone authoritative, the former *Codex* being abrogated. It is this revised *Codex* which has come down to the modern world, all copies of the earlier edition having disappeared.

The constitutions contained in it number 4652, the earliest dating from Hadrian, the latest being of course Justinian's own. A few thus belong to the period to which the greater part of the *Digest* belongs, *i.e.*, the so-called classical period of Roman law down to the time of Alexander Severus (244); but the great majority are later, and belong to one or other of the four great eras of imperial legislation, the eras of Diocletian, of Constantine, of Theodosius II., and of Justinian himself. Although this *Codex* is said to have the same general order as that of the *Digest*, viz., the order of the Perpetual Edict, there are considerable differences of arrangement between the two. It is divided into twelve books. Its contents, although of course of the utmost practical importance to the lawyers of that time, and of much value still, historical as well as legal, are far less interesting and scientifically admirable than the extracts preserved in the *Digest*. The difference is even greater than that between the English Reports of Cases decided since the days of Lord Holt and the English Acts of Parliament for the same two centuries.

The emperor's scheme was now complete. All the Roman law had been gathered into two volumes of not immoderate size, and a satisfactory manual for beginners added. But, as the appetite comes with eating, Justinian and Tribonian had grown so fond of legislating that they found it hard to leave off. Moreover, the very simplifications that had been so far effected brought into view with more clearness such anomalies or pieces of injustice as still continued to deform the law. Thus no sooner had the work been rounded off than fresh excrescences began to be created by the publication of new laws. Between 534 and 565 Justinian issued a great number of ordinances, dealing with all sorts of subjects, and seriously altering the law on many points,—the majority appearing before the death of Tribonian, which happened in 545. These ordinances are called, by way of distinction, new constitutions, *Novellæ constitutiones post Codicem* (νεαραὶ διατάξεις), *Novels*. Although the emperor had stated in publishing the *Codex* that all further statutes (if any) would be officially collected, this promise does not seem to have been redeemed. The three collections of the *Novels* which we possess are apparently private collections, nor do we even know how many such constitutions were promulgated. One of the three contains 168 (together with 13 Edicts), but some of these are by the emperors Justin II. and Tiberius II. Another, the so-called *Epitome of Julian*, contains 125 Novels in Latin; and the third, the *Liber Authenticarum* or *Vulgata Versio*, has 134, also in Latin. This last was the collection first known and chiefly used in the West during the Middle Ages; and of its 134 only 97 have been written on by the *glossatores* or mediæval commentators; these therefore alone have been received as binding in those countries which recognize and obey the Roman law,—according to the maxim *Quicquid non agnoscit glossa, nec agnoscit curia*. And, whereas Justinian's constitutions contained in the *Codex* were all issued in Latin, the rest of the book being in that tongue, these *Novels* were nearly all published in Greek, Latin translations being of course made for the use of the western provinces. They are very bulky, and with the exception of a few, particularly the 116th and 118th, which introduce the most sweeping and laudable reforms into the law of intestate succession, are much more interesting as supplying materials for the history of the time, social, economical, and ecclesiastical, than in respect of any purely legal merits. They may be found printed in any edition of the *Corpus Juris Civilis*.

This *Corpus Juris*, which bears and immortalizes Justinian's name, consists of the four books described above,—(1) the authorized collection of imperial ordinances (*Codex Constitutionum*); (2) the authorized collection of extracts from the great jurists (*Digesta* or *Pandectæ*); (3) the elementary handbook (*Institutiones*); (4) the unauthorized collection of constitutions subsequent to the *Codex* (*Novellæ*).

From what has been already stated, the reader will perceive that Justinian did not, according to a strict

of the paragraph in the extract (if there are more paragraphs than one), and appending the number of the book and title. We in Britain and America usually cite by the numbers of the book, the title, and the paragraph, without referring to the initial words.

[1] See Bluhme, "Die Ordnung der Fragmente in den Pandektentiteln," in Savigny's *Zeitschr. f. gesch. Rechtswissenschaft*. vol. iv.

use of terms, codify the Roman law. By a codification, we understand the reduction of the whole pre-existing body of law to a new form, the restating it in a series of propositions, scientifically ordered, which may or may not contain some new substance, but are at any rate new in form. If he had, so to speak, thrown into one furnace all the law contained in the treatises of the jurists and in the imperial ordinances, fused them down, the gold of the one and the silver of the other, and run them out into new moulds, this would have been codification. What he did do was something quite different. It was not codification, but consolidation, not remoulding, but abridging. He made extracts from the existing law, preserving the old words, and merely cutting out repetitions, removing contradictions, retrenching superfluities, so as immensely to reduce the bulk of the whole. And he made not one set of such extracts but two, one for the jurist law, the other for the statute law. He gave to posterity not one code but two digests or collections of extracts, which are new only to this extent, that they are arranged in a new order, having been previously altogether unconnected with one another, and that here and there their words have been modified in order to bring one extract into harmony with some other. Except for this, the matter is old in expression as well as in substance.

Thus regarded, and even omitting to remark that the *Novels*, never having been officially collected, much less incorporated with the *Codex*, mar the symmetry of the structure, Justinian's work may appear to entitle him and Tribonian to much less credit than they have usually received for it. But let it be observed, first, that to reduce the huge and confused mass of pre-existing law into the compass of these two collections was an immense practical benefit to the empire; secondly, that, whereas the work which he undertook was accomplished in seven years, the infinitely more difficult task of codification might probably have been left unfinished at Tribonian's death, or even at Justinian's own, and been abandoned by his successor; thirdly, that in the extracts preserved in the *Digest* we have the opinions of the greatest legal luminaries given in their own admirably lucid, philosophical, and concise language, while in the extracts of which the *Codex* is composed we find valuable historical evidence bearing on the administration and social condition of the later pagan and earlier Christian empire; fourthly, that Justinian's age, that is to say, the intellect of the men whose services he commanded, was quite unequal to so vast an undertaking as the fusing upon scientific principles into one new organic whole of the entire law of the empire. With sufficient time and labor, the work might no doubt have been done; but what we possess of Justinian's own legislation, and still more what we know of the general condition of literary and legal capacity in his time, makes it certain that it would not have been well done, and that the result would have been not more valuable to the Romans of that age, and much less valuable to the modern world, than are the results, preserved in the *Digest* and the *Codex*, of what he and Tribonian actually did.

To the merits of the work as actually performed some reference has already been made. The chief defect of the *Digest* is in point of scientific arrangement, a matter about which the Roman lawyers, perhaps one may say the ancients generally, cared very little. There are some repetitions and some inconsistencies, but not more than may fairly be allowed for in a compilation of such magnitude executed so rapidly. Tribonian has been blamed for the insertions the compilers made in the sentences of the old jurists (the so-called *Emblemata Triboniani*); but it was a part of Justinian's plan that such insertions should be made, so as to adapt those sentences to the law as settled in the emperor's time. On Justinian's own laws, contained in the *Codex* and in his *Novels*, a somewhat less favorable judgment must be pronounced. They, and especially the latter, are diffuse and often lax in expression, needlessly prolix, and pompously rhetorical. The policy of many, particularly of those which deal with ecclesiastical matters, may also be condemned; yet some gratitude is due to the legislator who put the law of intestate succession on that plain and rational footing whereon it has ever since continued to stand. It is somewhat remarkable that, although Justinian is so much more familiar to us by his legislation than by anything else, this sphere of his imperial labor is hardly referred to by any of the contemporary historians, and then only with censure. Procopius complains that he and Tribonian were always repealing old laws and enacting new ones, and accuses them of venal motives for doing so.

The *Corpus Juris* of Justinian continued to be, with of course a few additions in the ordinances of succeeding emperors, the chief law-book of the Roman world till the time of the Macedonian dynasty, when, towards the end of the 9th century, a new system was prepared and issued by those sovereigns, which we know as the *Basilica*. It is of course written in Greek, and consists of parts of the substance of the *Codex* and the *Digest*, thrown together and often altered in expression, together with some matter from the *Novels* and imperial ordinances posterior to Justinian. In the western provinces, which had been wholly severed from the empire before the publication of the *Basilica*, the law as settled by Justinian held its ground; but copies of the *Corpus Juris* were extremely rare, nor did the study of it revive until the end of the 11th century.

The best edition of the *Digest* is that of Mommsen, Berlin, 1868–70, and of the *Codex* that of Krueger, Berlin, 1875–77.

2. In his financial administration of the empire, Justinian is represented to us as being at once rapacious and extravagant. His unwearied activity and inordinate vanity led him to form all kinds of expensive projects, and undertake a great many costly public works, many of them, such as the erection of palaces and churches, unremunerative. The money needed for these, for his wars, and for buying off the barbarians who threatened the frontiers, had to be obtained by increasing the burdens of the people. They suffered, not only from the regular taxes, which were seldom remitted even after bad seasons, but also from monopolies; and Procopius goes so far as to allege that the emperor made a practice of further recruiting his treasury by confiscating on slight or fictitious pretexts the property of persons who had displeased Theodora or himself. Fiscal severities were no doubt one cause of the insurrections which now and then broke out, and in the gravest of which, 532 A.D., thirty thousand persons are said to have perished in the capital. It is not always easy to discover, putting together the trustworthy evidence of Justinian's own laws and the angry complaints of Procopius, what was the nature and justification of the changes made in the civil administration. But the general conclusion seems to be that these changes were always in the direction of further centralization, increasing the power of the chief ministers and their offices, bringing all more directly under the control of the crown, and in some cases limiting the powers and appropriating the funds of local municipalities. Financial necessities compelled retrenchment, so that a certain number of offices were suppressed altogether, much to the disgust of the office-holding class, which was numerous and wealthy, and had almost come to look on the civil service as its hereditary possession. The most remarkable instance of this policy was the discontinuance of the consulship. This great office had remained a dignity centuries after it had ceased to be a power; but it was a very costly dignity, the holder being expected to spend large sums in public displays. As these sums were provided by the state, Justinian saved something considerable by stopping the payment. He named no consul after Basilius, who was the name-giving consul of the year 541 A.D.

In a bureaucratic despotism the greatest merit of a sovereign is to choose capable and honest ministers. Justinian's selections were usually capable, but not so

often honest; probably it was hard to find thoroughly upright people; possibly they were not the people who would have been most serviceable in carrying out the imperial will, and especially in replenishing the imperial treasury. Even the great Tribonian labors under the reproach of corruption, while the fact that Justinian maintained John of Cappadocia in power long after his greed, his unscrupulousness, and the excesses of his private life had excited the anger of the whole empire, reflects little credit on his own principles of government and sense of duty to his subjects. The department of administration in which he seems to have felt most personal interest was that of public works. He spent immense sums on buildings of all sorts, on quays and harbors, on fortifications, repairing the walls of cities and erecting castles in Thrace to check the inroads of the barbarians, on aqueducts, on monasteries, above all, upon churches. Of these works only two remain perfect, St. Sophia in Constantinople, now a mosque, and one of the architectural wonders of the world, and the church of SS. Sergius and Bacchus, now commonly called Little St. Sophia, which stands about half a mile from the great church, and is in its way a very delicate and beautiful piece of work. The church of San Vitale at Ravenna, though built in Justinian's reign, and containing mosaic pictures of him and Theodora, does not appear to have owed anything to his mind or purse.

3. Justinian's ecclesiastical policy was so complex and varying that it is impossible within the limits of this article to do more than indicate its bare outlines. For many years before the accession of his uncle Justin, the Eastern world had been vexed by the struggles of the Monophysite party, who recognized only one nature in Christ, against the view which then and ever since has maintained itself as orthodox, that the divine and human natures coexisted in Him. The latter doctrine had triumphed at the council of Chalcedon, and was held by the whole Western Church, but Egypt, great part of Syria and Asia Minor, and a considerable minority even in Constantinople clung to Monophysitism. The emperors Zeno and Anastasius had been strongly suspected of it, and the Roman bishops had refused to communicate with the patriarchs of Constantinople since 484, when they had condemned Acacius for accepting the formula of conciliation issued by Zeno. One of Justinian's first public acts was to put an end to this schism by inducing Justin to make the then patriarch renounce this formula and declare his full adhesion to the creed of Chalcedon. When he himself came to the throne he endeavored to persuade the Monophysites to come in by summoning some of their leaders to a conference. This failing, he ejected suspected prelates, and occasionally persecuted them, though with far less severity than that applied to the heretics of a deeper dye, such as Montanists or even Arians. Not long afterwards, his attention having been called to the spread of Origenistic opinions in Syria, he issued an edict condemning fourteen propositions drawn from the writings of the great Alexandrian, and caused a synod to be held under the presidency of Mennas (whom he had named patriarch of Constantinople), which renewed the condemnation of the impugned doctrines and anathematized Origen himself. Still later, he was induced by the machinations of some of the prelates who haunted his court, and by the influence of Theodora, herself much interested in theological questions, and more than suspected of Monophysitism, to raise a needless, mischievous, and protracted controversy. The Monophysites sometimes alleged that they could not accept the decrees of the council of Chalcedon because that council had not condemned, but (as they argued) virtually approved, three writers tainted with Nestorian principles, viz., Theodore of Mopsuestia, Theodoret, and Ibas, bishop of Edessa. It was represented to the emperor, who was still pursued by the desire to bring back the schismatics, that a great step would have been taken towards reconciliation if a condemnation of these teachers, or rather of such of their books as were complained of, could be brought about, since then the Chalcedonian party would be purged from any appearance of sympathy with the errors of Nestorius. Not stopping to reflect that in the angry and suspicious state of men's minds he was sure to lose as much in one direction as he would gain in the other, Justinian entered into the idea, and put forth an edict exposing and denouncing the errors contained in the writings of Theodore generally, in the treatise of Theodoret against Cyril of Alexandria, and in a letter of Bishop Ibas (a letter whose authenticity was doubted, but which passed under his name) to the Persian bishop Maris. This edict was circulated through the Christian world to be subscribed by the bishops. The four Eastern patriarchs, and the great majority of the Eastern prelates generally, subscribed, though reluctantly, for it was felt that a dangerous precedent was being set when dead authors were anathematized, and that this new movement could hardly fail to weaken the authority of the council of Chalcedon. Among the Western bishops, who were less disposed both to Monophysitism and to the subservience, and especially by those of Africa, the edict was earnestly resisted. When it was found that Pope Vigilius did not forthwith comply, he was summoned to Constantinople. Even there he resisted, not so much, it would seem, from any scruples of his own, for he was not a high-minded man, as because he knew that he dared not return to Italy if he gave way. Long disputes and negotiations followed, the end of which was that Justinian summoned a general council of the church, that which we reckon the Fifth, which condemned the impugned writings, and anathematized several other heretical authors. Its decrees were received in the East, but long contested in the Western Church, where a schism arose that lasted for seventy years. This is the controversy known as that of the Three Chapters (*Tria capitula*, τρία κεφάλαια), apparently from the three propositions or condemnations contained in Justinian's original edict, one relating to Theodore's writings and person, the second to the incriminated treatise of Theodoret (whose person was not attacked), the third to the letter (if genuine) of Ibas (see Hefele, *Conciliengeschichte*, ii. 777).

At the very end of his long career of theological discussion, Justinian himself lapsed into heresy, by accepting the doctrine that the earthly body of Christ was incorruptible, insensible to the weakness of the flesh, a doctrine which had been advanced by Julian, bishop of Halicarnassus, and went by the name of Aphthartodocetism. According to his usual practice, he issued an edict enforcing this view, and requiring all patriarchs, metropolitans, and bishops to subscribe to it. Some, who not unnaturally held that it was rank Monophysitism, refused at once, and were deprived of their sees, among them Eutychius the eminent patriarch of Constantinople. Others submitted or temporized; but, before there had been time enough for the matter to be carried through, the emperor died, having tarnished if not utterly forfeited by this last error the reputation won by a life devoted to the service of orthodoxy.

As no preceding sovereign had been so much interested in church affairs, so none seems to have shown so much activity as a persecutor both of heathens and of heretics. He renewed with additional stringency the laws against both these classes. The former embraced a large part of the rural population in certain secluded districts, such as parts of Asia Minor and Peloponnesus; and we are told that the efforts directed against them resulted in the forcible baptism of seventy thousand persons in Asia Minor alone. Heathenism, however, survived; we find it in Laconia in the end of the 9th century, and in northern Syria it has lasted till our own times. There were also a good many crypto-pagans among the educated population of the capital.

Procopius, for instance, if he was not actually a pagan, was certainly very little of a Christian. Inquiries made in the third year of Justinian's reign drove nearly all of these persons into an outward conformity, and their offspring seem to have become ordinary Christians. At Athens, the philosophers who taught in the schools hallowed by memories of Plato still openly professed what passed for heathenism, though it was really a body of moral doctrine, strongly tinged with mysticism, in which there was far more of Christianity and of the speculative metaphysics of the East than of the old Olympian religion. Justinian, partly from religious motives, partly because he discountenanced all rivals to the imperial university of Constantinople, closed these Athenian schools (529). The professors sought refuge at the court of Chosroes, king of Persia, but were soon so much disgusted by the ideas and practices of the fire-worshippers that they returned to the empire, Chosroes having magnanimously obtained from Justinian a promise that they should be suffered to pass the rest of their days unmolested. Heresy proved more obstinate. The severities directed against the Montanists of Phrygia led to a furious war, in which most of the sectaries perished, while the doctrine was not extinguished. Harsh laws provoked the Samaritans to a revolt, from whose effects Palestine had not recovered when conquered by the Arabs in the following century. The Nestorians and the Eutychian Monophysites were not threatened with such severe civil penalties, although their worship was interdicted, and their bishops were sometimes banished; but this vexatious treatment was quite enough to keep them disaffected, and the rapidity of the Mahometan conquests may be partly traced to that alienation of the bulk of the Egyptian and a large part of the Syrian population which dates from Justinian's persecutions.[1]

4. Justinian was engaged in three great foreign wars, two of them of his own seeking, the third a legacy which nearly every emperor had come into for three centuries, the secular strife of Rome and Persia. The Sassanid kings of Persia ruled a dominion which extended from the confines of Syria to those of India, and from the straits of Oman to the Caucasus. The martial character of their population made them formidable enemies to the Romans, whose troops were at this epoch mainly barbarians, the settled and civilized subjects of the empire being as a rule averse to war. When Justinian came to the throne, his troops were maintaining an unequal struggle on the Euphrates against the armies of Kobad. After some campaigns, in which the skill of Belisarius obtained considerable successes, a peace was concluded in 533 with Chosroes Anushirvan, who had succeeded Kobad two years before. This lasted till 539, when Chosroes declared war, alleging that Justinian had been secretly intriguing against him with the Ephthalite Huns, and doubtless moved by alarm and envy at the victories which the Romans had been gaining in Italy. The emperor was too much occupied in the West to be able adequately to defend his eastern frontier. Chosroes advanced into Syria with little resistance, and in 540 captured Antioch, then the greatest city in Asia, carrying off its inhabitants into captivity. The war continued with varying fortunes for four years more in this quarter; while in the meantime an even fiercer struggle had begun in the mountainous region inhabited by the Lazes at the southeastern corner of the Black Sea. When after two and twenty years of fighting no substantial advantage had been gained by either party, Chosroes agreed in 562 to a peace which left Lazica to the Romans, but under the dishonorable condition of their paying thirty thousand pieces of gold annually to the Persian king. Thus no result of permanent importance flowed from these Persian wars, except that they greatly weakened the Roman empire, increased Justinian's financial embarrassments, and prevented him from prosecuting with sufficient vigor his enterprises in the West.

These enterprises had begun in 533 with an attack on the Vandals, who were then reigning in Africa. Belisarius, despatched from Constantinople with a large fleet and army, landed without opposition, and destroyed the barbarian power in two engagements. North Africa from beyond the straits of Gibraltar to the Syrtes became again a Roman province, although the Moorish tribes of the interior maintained a species of independence; and part of southern Spain was also recovered for the empire. The ease with which so important a conquest had been effected encouraged Justinian to attack the Ostrogoths of Italy, whose kingdom, though vast in extent, for it included part of southeastern Gaul, Rhætia, Dalmatia, and part of Pannonia, as well as Italy, Sicily, Sardinia, and Corsica, had been grievously weakened by the death first of the great Theodoric, and some years later of his grandson Athalaric, so that the Gothic nation was practically without a head. Justinian began the war in 535, taking as his pretext the murder of Queen Amalasontha, daughter of Theodoric, who had placed herself under his protection, and alleging that the Ostrogothic kingdom had always owned a species of allegiance to the emperor at Constantinople. There was some foundation for this claim, although of course it could not have been made effective against Theodoric, who was more powerful than his supposed suzerain. Belisarius, who had been made commander of the Italian expedition, overran Sicily, reduced southern Italy, and in 536 occupied Rome. Here he was attacked in the following year by Vitigis, who had been chosen king by the Goths, with a greatly superior force. After a siege of more than a year, the energy, skill, and courage of Belisarius, and the sickness which was preying on his troops, obliged Vitigis to retire. Belisarius pursued his diminished army northwards, shut him up in Ravenna, and ultimately received the surrender of that impregnable city. Vitigis was sent prisoner to Constantinople, where Justinian treated him, as he had previously treated the captive Vandal king, with clemency. The imperial administration was established through Italy, but its rapacity soon began to excite discontent, and the kernel of the Gothic nation had not submitted. After two short and unfortunate reigns, the crown had been bestowed on Totila or Baduila, a warrior of distinguished abilities, who by degrees drove the imperial generals and governors out of Italy. Belisarius was sent against him, but with forces too small for the gravity of the situation. He moved from place to place during several years, but saw city after city captured by or open its gates to Totila, till only Ravenna, Otranto, and Ancona remained. Justinian was occupied by the ecclesiastical controversy of the Three Chapters, and had not the money to fit out a proper army and fleet; indeed, it may be doubted whether he would ever have roused himself to the necessary exertions but for the presence at Constantinople of a knot of Roman exiles, who kept urging him to reconquer Italy, representing that with their help and the sympathy of the people it would not be a difficult enterprise. The emperor at last complied, and in 552 a powerful army was despatched under Narses, an Armenian eunuch now advanced in life, but reputed the most skilful general of the age, as Belisarius was the hottest soldier. He marched along the coast of the Gulf of Venice, and encountered the army of Totila at Taginæ, not far from Cesena. Totila was slain, and the Gothic cause irretrievably lost. The valiant remains of the nation made another stand under Teias on the Lactarian hill in Campania; after that they disappear from history. Italy was recovered for the empire, but it was an Italy terribly impoverished and depopulated, whose possession carried little strength with it. Justinian's policy both in

[1] For a fuller account of the ecclesiastical policy of Justinian and its results the present writer ventures to refer to the article "Justinian" which he has contributed to the third volume of Dr. Smith's *Dictionary of Christian Biography*.

the Vandalic and in the Gothic war stands condemned by the result. The resources of the state, which might better have been spent in defending the northern frontier against Slavs and Huns and the eastern frontier against Persians, were consumed in the conquest of two countries which had suffered too much to be of any substantial value, and which, separated by language as well as by intervening seas, could not be permanently retained. However, Justinian must have been almost preternaturally wise to have foreseen this: his conduct was in the circumstances only what might have been expected from an ambitious prince who perceived an opportunity of recovering territories that had formerly belonged to the empire, and over which its rights were conceived to be only suspended.

Besides these three great foreign wars, Justinian's reign was troubled by a constant succession of border inroads, especially on the northern frontier, where the various Slavonic and Hunnish tribes who were established along the lower Danube and on the north coast of the Black Sea made frequent marauding expeditions into Thrace and Macedonia, sometimes penetrating as far as the walls of Constantinople in one direction and the isthmus of Corinth in another. Immense damage was inflicted by these marauders on the subjects of the empire, who seem to have been mostly too peaceable to defend themselves, and whom the emperor could not spare troops enough to protect. Fields were laid waste, villages burnt, large numbers of people carried into captivity; and on one occasion the capital was itself in danger.

It only remains to say something regarding Justinian's personal character and capacities, with regard to which a great diversity of opinion has existed among historians. The civilians, looking on him as a patriarch of their science, have as a rule extolled his wisdom and virtues; while ecclesiastics of the Roman Church, from Cardinal Baronius downwards, have been offended by his arbitrary conduct towards the popes, and by his last lapse into heresy, and have therefore been disposed to accept the stories which ascribe to him perfidy, cruelty, rapacity, and extravagance. The difficulty of arriving at a fair conclusion is increased by the fact that Procopius, who is our chief authority for the events of his reign, speaks with a very different voice in his secret memoirs (the *Anecdota*) from that which he has used in his published history, and that some of the accusations contained in the former work are so rancorous and improbable that a certain measure of discredit attaches to everything which it contains. The truth seems to be that Justinian was not a great ruler in the higher sense of the word, that is to say, a man of large views, deep insight, a capacity for forming just such plans as the circumstances needed, and carrying them out by a skilful adaptation of means to ends. But he was a man of considerable abilities, wonderful activity of mind, and admirable industry. He was interested in many things, and threw himself with ardor into whatever he took up; he contrived schemes quickly, and pushed them on with an energy which usually made them succeed when no long time was needed, for, if a project was delayed, there was a risk of his tiring of it and dropping it. Although vain and full of self-confidence, he was easily led by those who knew how to get at him, and particularly by his wife. She exercised over him that influence which a stronger character always exercises over a weaker, whatever their respective positions; and unfortunately it was seldom a good influence, for Theodora seems to have been a woman who, with all her brilliant gifts of intelligence and manner, had no principles and no pity. Justinian was rather quick than strong or profound; his policy does not strike one as the result of deliberate and well-considered views, but dictated by the hopes and fancies of the moment. His activity was in so far a misfortune as it led him to attempt too many things at once, and engage in undertakings so costly that oppression became necessary to provide the funds for them. Even his devotion to work, which excites our admiration in the centre of a luxurious court, was to a great extent unprofitable, for it was mainly given to theological controversies which neither he nor any one else could settle. Still, after making all deductions, it is plain that the man who accomplished so much, and kept the whole world so occupied, as Justinian did during the thirty-eight years of his reign, must have possessed no common abilities. He was affable and easy of approach to all his subjects, with a pleasant address; nor does he seem to have been, like his wife, either cruel or revengeful. We hear several times of his sparing those who had conspired against him. But he was not scrupulous in the means he employed, and he was willing to maintain in power detestable ministers if only they served him efficiently and filled his coffers. His chief passion, after that for his own fame and glory, seems to have been for theology and religion; it was in this field that his literary powers exerted themselves (for he wrote controversial treatises and hymns), and his taste also, for among his numerous buildings the churches are those on which he spent most thought and money. Considering that his legal reforms are those by which his name is mainly known to posterity, it is curious that we should have hardly any information as to his legal knowledge, or the share which he took in those reforms. In person he was somewhat above the middle height, well-shaped, with plenty of fresh color in his cheeks, and an extraordinary power of doing without food and sleep. He spent most of the night in reading or writing, and would sometimes go for a day with no food but a few green herbs. Two mosaic figures of him exist at Ravenna, one in the apse of the church of S. Vitale, the other in the church of S. Apollinare in Urbe; but of course one cannot be sure how far in such a stiff material the portrait fairly represents the original. He had no children by his marriage with Theodora, and did not marry after her decease. On his death, which took place November 14, 565, the crown passed to his nephew Justin II.

Authorities.—For the life of Justinian the chief authorities are Procopius (*Historiæ*, *De Ædificiis*, *Anecdota*) and (from 552 A.D.) the *History* of Agathias; the Chronicle of Johannes Malalas is also of value. Occasional reference must be made to the writings of Jordanes and Marcellinus, and even to the late compilations of Cedrenus and Zonaras. The *Vita Justiniani* of Ludewig or Ludwig (Halle, 1731), a work of patient research, is frequently referred to by Gibbon in his important chapters relating to the reign of Justinian. There is a *Vie de Justinien* by Isambert (2 vols., Paris, 1856). (J. BR.)

JUSTINIAN II., Rhinotmetus, Roman emperor of the East from 685 to 695, and from 704 to 711, succeeded his father Constantine IV., at the age of sixteen. His reign was unhappy both at home and abroad. He made a truce with the Arabs, which admitted them to the joint possession of Armenia, Iberia, and Cyprus, while by removing 10,000 Christian Maronites from their native Lebanon, he gave the Arabs a command over Asia Minor of which they took advantage in 692 by conquering all Armenia. In 688 Justinian was defeated by the Bulgarians. Meanwhile the bitter dissensions caused in the church by the emperor, his bloody persecution of the Manichæans, and the insatiable and cruel rapacity with which, through his creatures Stephanus and Theodatus, he extorted the means of gratifying his sumptuous tastes, maddened his subjects into rebellion. In 695 they rose under Leontius, and, after cutting off the emperor's nose (whence his surname), banished him to Cherson in the Crimea. Leontius, after a reign of three years, was in turn dethroned and imprisoned by Tiberius Absimarus, who next assumed the purple. Justinian meanwhile had escaped from Cherson and married Theodora, sister of Busirus, khan of the Khazars. Compelled, however, by the intrigues of Tiberius, to quit his new home, he fled to Terbelis, king of the Bulgarians. With an army of 15,000 horsemen Justinian suddenly pounced upon Constantinople, slew his rivals Leontius and Tiberius, with thousands of their partisans, and once more ascended the throne in 704. His second reign was marked by an unsuccessful war against Terbelis, by Arab victories in Asia Minor, by devastating expeditions sent against his own cities of Ravenna and Cherson, and by the same cruel rapacity towards his subjects. Conspiracies again broke out; Bardanes, surnamed Philippicus, assumed the purple; and Justinian, the last of the house of Heraclius, was assassinated in Asia Minor, December, 711.

JUTE is a vegetable fibre which, notwithstanding the fact that it has come under the notice of manufacturing communities only within comparatively recent times, has advanced in importance with so rapid strides that it now occupies among vegetable fibres a position, in the manufacturing scale, inferior only to

cotton and flax. The term jute appears to have been first used by Dr. Roxburgh in 1795, when he sent to the directors of the East India Company a bale of the fibre which he described as "the jute of the natives." Importations of the substance had been made at earlier times under the name of *pát*, an East Indian native term by which the fibre continued to be spoken of in England till the early years of the 19th century, when it was supplanted by the name it now bears. This modern name appears to be derived from *jhot* or *jhout* (Sanskrit, *jhat*), the vernacular name by which the substance is known in the Cuttack district, where the East India Company had extensive roperies at the time Dr. Roxburgh first used the term.

The fibre is obtained from two species of *Corchorus* (nat. ord. *Tiliaceæ*), *C. capsularis* and *C. olitorius*, the products of both being so essentially alike that neither in commerce nor agriculture is there any distinction made between them. These and various other species of *Corchorus* are natives of Bengal, where they have been cultivated from very remote times for economic purposes, although there is reason to believe that the cultivation did not originate in the northern parts of India. The two species cultivated for jute fibre are in all respects very similar to each other, except in their fructification and the relatively greater size attained

FIG. 1.—Capsules of Jute Plants. *a, Corchorus capsularis; b, C. olitorius.*

by *C. capsularis*. The capsules or seed-pods in the case of *C. capsularis* are globular, rough, and wrinkled, while in *C. olitorius* they are slender quill-like cylinders, a very marked distinction, as may be noted from fig. 1, in which *a* and *b* show the capsules of *C. capsularis* and *C. olitorius* respectively. Fig. 2 represents a flowering top of *C. olitorius*. The two plants are thus botanically defined:—

Corchorus capsularis.—Annual; 5–10 feet; calyx deeply 5-cleft; petals 5; leaves alternate, oblong, acuminate, serrated, two lower serratures terminating in narrow filaments; peduncles short; flowers whitish-yellow, in clusters opposite the leaves; capsules globose, truncated, wrinkled, and muricated, 5-celled; seeds few in each cell, without transverse partitions; in addition to the 5-partite cells, there are other 5 alternating, smaller and empty.

Corchorus olitorius.—Annual; 5–6 feet; erect; leaves alternate, ovate-acuminated, serrated, the two lower serratures terminated by a slender filament; peduncles 1–2 flowered; calyx 5-sepalled; petals 5; capsules nearly cylindrical, 10-ribbed, 5-celled, 5-valved; seeds numerous, with nearly perfect transverse septa; flowers small, yellow.

Both species are cultivated in India, not only on account of their fibre, but also for the sake of their leaves, which are there extensively used as a pot-herb. The use of *C. olitorius* for the latter purpose dates from very ancient times, if it may be identified, as some suppose, with the mallows (מַלּוּחַ) mentioned in Job xxx. 4, "Who cut up mallows by the bushes."

FIG. 2.—*Corchorus olitorius.*

It is certain that the Greeks used this plant as a pot-herb; and by many other nations around the shores of the Mediterranean this use of it was, and is still, common. Throughout Bengal the name by which the plants when used as edible vegetables are recognized is *nalitá;* when on the other hand they are spoken of as fibre-producers it is generally under the name *pát*. Both species are cultivated, on account of the fibre they yield, in the greater part of Bengal. The cultivation of *C. capsularis* is most prevalent in central and eastern Bengal, while in the neighborhood of Calcutta, where, however, the area under cultivation is limited, *C. olitorius* is principally grown. In 1872, a year which showed an extraordinary development of the cultivation, there were returned 921,000 acres as under jute in Bengal, to which Pubna contributed 122,000, Dinajpur 117,000, and Rangpur 100,000 acres respectively.

Hitherto jute has not been cultivated to any considerable extent in localities other than Bengal. From remote times it has been grown in the Hankow district of China, but not largely. In the United States of America the cultivation of the plants has also been introduced, but it has not made much progress. Recently considerable attention has been given to the culture of the plant in Egypt, and in the Dundee trade report of the 23d March, 1881, there occurs the following statement:—"Some samples of jute grown in Egypt are being shown here. Reports on quality are varied, but, considering it is a first attempt, on the whole satisfactory. It proves beyond a doubt that Egypt is capable of producing this material, and for

the trade of the district this is a matter of great importance, as having the fibre grown near at hand will enable our manufacturers to compete more successfully in all markets with the Indian mills."

A hot moist climate with abundant rainfall and rich alluvial soil appear to be the conditions most favorable for the successful cultivation of the jute plants. The land requires to be well tilled and abundantly manured and, the ground being so prepared, the general time of sowing the seed throughout northern and eastern Bengal extends from about the middle of March to the end of May. The seed is sown broadcast on the prepared ground, the young plants are thinned out to 6 inches apart, and the ground carefully weeded. The stalks are ready for cutting down between the middle of August and the middle of October. As a rule the plants are cut down close to the root with a kind of bill-hook or sickle, and the fibre is obtained best in quality when the crop is secured in the flower. It is, however, common to allow the crop to run to seed and even to ripen seed before cutting, a practice which renders the resulting fibre hard and woody, thus intensifying one of the principal drawbacks of the jute fibre.

The fibre is separated from the stalks by the process of retting practised in the case of flax, hemp, etc. (see FLAX, vol. ix. p. 256). In certain districts of Bengal it is the practice to stack the crop for a few days previous to retting, during which period the leaves drop off the stalks, and otherwise the stalks themselves are thereby brought into a condition for more rapid retting. The general practice, however, is to tie the crop into bundles sufficient for one man to carry, and to place these at once in water for the purpose of retting. Pools and ponds of stagnant water are preferred for retting where such are available, but the process is also carried on in the water of running streams. The period necessary for the completion of the retting process varies much according to the temperature and condition of the water, and may be said to occupy from two or three days up to a month. The stalks are examined periodically to test the progress of the retting operation, and when it is found that the fibres peel off and separate readily from the woody portion of the stalk, the operation is complete, and the bundles are withdrawn. The following is a description of the method generally practised for separating the fibre from the stalks. "The proper point being attained, the native operator, standing up to his middle in water, takes as many of the stalks in his hands as he can grasp, and, removing a small portion of the bark from the ends next to the roots, and grasping them together, he strips off the whole with a little management from end to end without either breaking stem or fibre. Having prepared a certain quantity into this half state, he next proceeds to wash off: this is done by taking a large handful; swinging it round his head he dashes it repeatedly against the surface of the water, drawing it through towards him so as to wash off the impurities, then with a dexterous throw he fans it out on the surface of the water and carefully picks off all remaining black spots. It is now wrung out so as to remove as much water as possible, and then hung up on lines prepared on the spot to dry in the sun." The separated fibre is then washed, sun-dried, and made up into hanks, and so is ready for the market. In favorable circumstances the produce of cleaned fibre amounts, on an average, to about 6 maunds per beegah (13⅓ cwts. per acre), but official returns from various districts show differences ranging from 5 to 26 or even 30 cwts. per acre. The cost of cultivation also varies much in different localities. According to the official report of Hem Chunder Kerr, it is as much as Rs. 17 per beegah (about £2 12s. per acre) in Chittagong, and as low as R. 1 (or 3s. per acre) in Manbhum; but such estimates are obviously of little value, as the cultivation is carried on by the ryots without the aid of hired labor, and forms generally only one among the various cultivated products of the land by which a livelihood is obtained. Jute, however, is certainly one of the most cheaply raised and prepared of all fibres; and to this fact more than to any special excellency of character it possesses is due its now extensive employment as a manufacturing staple.

The characters by which qualities of jute are judged are principally color, lustre, softness, strength, length, firmness, uniformity, and cleanness of fibre. The best qualities of jute are of a clear white yellowish color, with a fine silky lustre, soft and smooth to the touch, and fine, long, and uniform in fibre. As a general rule the root ends are harsher and more woody than the middle and upper portions, but in fine jute this distinction is not so noticeable as in less valuable qualities. In length the fibre varies from 6 to 7 feet, but occasionally it is obtained to a length of 14 feet, and, generally speaking, in proportion to the length of the fibre is its fineness of quality. Inferior qualities of jute are brownish in color and, especially at the root ends, harsh and woody, with much adhering dark cortical matter and other impurities. The fibre is decidedly inferior to flax and hemp in strength and tenacity; and, owing to a peculiarity in its microscopic structure, by which the walls of the separate cells composing the fibre vary much in thickness at different points, the single strands of fibre are of unequal strength. Recently prepared fibre is always stronger, more lustrous, softer, and whiter than such as has been stored for some time,—age and exposure rendering it brown in color and harsh and brittle in quality. Jute, indeed, is much more woody in texture than either flax or hemp, a circumstance which may be easily demonstrated by its behavior under appropriate reagents; and to that fact is due the change in color and character it undergoes on exposure to the air. The fibre bleaches with facility, up to a certain point, sufficient to enable it to take brilliant and delicate shades of dye color, but it is with great difficulty brought to a pure white by bleaching. A very striking and remarkable fact, which has much practical interest, is its highly hygroscopic nature. While in a dry position and atmosphere it may not possess more than 10 per cent. of moisture, under damp conditions it will absorb up to 30 per cent. or thereby.

As already stated, its commercial distinction is based on the botanical species of plant from which the fibre is prepared; but in the Calcutta market a series of commercial staples are recognized based on the districts whence they are drawn, the values of which bear a pretty constant relation to each other. These classes, in the order of quality, are:—(1) *Uttariyá* or northern jute, coming from Rangpur, Goalpara, Bogra, and the districts north of Sirajganj;—for length, color, and fineness, this is unequalled; (2) *Deswál* or Sirajganj jute, which is valued on account of its softness, bright color, fineness, and strength,—in the last characteristic it is superior to Uttariyá jute; (3) *Desi* jute comes from Hooghly, Bardwan, Jessore, and the 24 Parganas; (4) *Deorá* jute is produced in Faridpur and Bakarganj,—it is a strong, coarse, dark, and sooty fibre, used principally for rope-making. The other qualities recognized in Calcutta are—(5) *Narainganji* jute from Dacca, a strong, soft, long fibre, of inferior color; (6) *Bákrábadi* jute from Dacca, of fine color and softness; (7) *Bhatial* jute from Dacca, very coarse but strong, and very suitable for rope-making; (8) *Karimganji* jute from the Mymensing district, a long, strong, and well-colored staple; (9) *Mirganji* jute, the produce of Rangpur, harsh and woody from over-ripeness of the stalks; and (10) *Jangipuri* jute of Patna, a short, weak, and foxy-colored fibre of very inferior quality. In the European markets these distinctions are not very much remarked, traders' marks and classification being the accepted standards of quality and condition. Moreover, it is only the finer qualities that are exported, the lower class jute being used locally for gunny bags, ropes, etc.

At Calcutta and various other centres the jute received from local traders is sorted, packed, and pressed into bales of 400 lb for shipment to the English and other markets. Woody and hard root ends, which will not press into bales, are cut off and sold separately under the name of "cuttings." "Jute," "cuttings," and "rejections" (the last the name of the low-class fibre) are the three heads under which jute fibre is entered in the trade and import lists of Western countries.

The Jute Trade of Calcutta..—The importation of jute into Europe commenced about the end of the last century, but so recently as that period it was confused with hemp. During the earlier years of the present century the imports slowly increased, but, as Hem Chunder Kerr says, "the shipments were so insignificant that little or no notice was taken of them by the custom house authorities." Since that time a great revolution has taken place. In 1829 the custom house assigned to jute a separate heading, in which year we find the exports amounted to 496 maunds (364 cwt.). From that time the growth of the trade has been upon the whole steady and continuous, and marked by extraordinary progress, as will be evident from the following table of exports, which is compiled from official sources:—

	Quantity.			Value.	Average of Five Years' Quantity.	Average of Five Years' Value.
	cwts.	qrs.	lb.	£	cwts.	
1829	364	2	0	62		
1830	1,776	2	0	417		
1831	7,677	3	0	2,222		
1832	23,852	2	0	6,361		
1833	25,333	2	18	6,577		
1829–33	59,004	3	18	15,639	11,800	£3,127
1834–38	337,415	3	0	83,246	67,483	16,649
1839–43	585,238	0	0	119,604	117,047	23,920
1844–48	1,170,279	0	0	256,125	234,055	51,225
1849–53	1,196,750	0	0	649,165	439,350	129,833
1854–58	3,554,133	0	0	1,298,339	710,826	259,667
1859–63	4,848,620	0	0	2,608,869	969,724	521,773
1864–68	13,140,550	0	0	6,129,590	2,628,110	1,225,918

1874–78	26,809,000	0	0	15,659,000	5,361,800	3,131,800
1879	5,755,000	0	0	3,636,500		
1880	6,316,000	0	0	4,119,200		

Excepting a comparatively insignificant fraction, the whole of these exports of raw jute have been consigned to Great Britain, the United States of America being the only other country which bulks at all largely in the returns. Occasional shipments were made to America from 1829 onwards; but the quantities were small and very fluctuating till about 1850, up to which year frequently the total imports for a year were under 1000 cwts. From 1850–51 onward a rapidly increasing but still fluctuating demand for raw jute has grown up in the United States, till in 1872–73 the American demand amounted to 307,718 cwts. of jute and 1,158,895 cwts. of cuttings and rejections. An importation of 3072 cwts. was made into France in 1836–37, but there was no steady demand for jute in that country till 1845–46, when 9708 cwts. were taken. Since that time there has been a varying but upon the whole increasing demand, and in 1872–73 there were imported 137,126 cwts. The only other considerable shipments are to East Indian ports; but, taken altogether, it may be said that quite nine-tenths of the raw jute which leaves Calcutta is primarily disposed of in the British market.

Jute Manufacture.—Long before jute came to be known and to occupy a prominent place amongst the textile fibres of Europe, it was in extensive use and formed the raw material of a large and important industry throughout the regions of eastern Bengal, in which the plant was cultivated. Among the native Hindu population the spinning and weaving of jute was, and still is, in various districts, the most important domestic industry. The forms into which the material is worked among the Hindu population—for the Mussulmans do not use jute—are cordage, cloth, and paper. The cordage is twisted into all sizes, from the fine thread used for weaving up to strong ropes for the hawsers of native boats and for tying bales. The more important native application of jute is, however, in the manufacture of gunny cloth and gunny bags, used in extraordinary quantity and number throughout the world, for packing and carrying all manner of goods and merchandise, and by the natives themselves for clothing and numerous domestic purposes. The ordinary mode of weaving gunnies for bags and other coarse purposes is thus described:—"Seven sticks or chattee weaving-posts, called *taná pará* or warp, are fixed upon the ground, occupying the length equal to the measure of the piece to be woven, and a sufficient number of twine or thread is wound on them as warp called *taná*. The warp is taken up and removed to the weaving machine. Two pieces of wood are placed at two ends, which are tied to the *ohari* and *okher* or roller; they are made fast to the *khoti*. The *belut* or treadle is put into the warp; next to that is the *sarsul;* a thin piece of wood is laid upon the warp, called *chupari* or regulator. There is no sley used in this, nor is a shuttle necessary; in the room of the latter a stick covered with thread called *singa* is thrown into the warp as woof, which is beaten in by a piece of plank called *beyno*, and as the cloth is woven it is wound up to the roller. Next to this is a piece of wood called *khetone*, which is used for smoothing and regulating the woof; a stick is fastened to the warp to keep the woof straight." Gunny cloth is woven of numerous qualities, according to the purpose to which it is devoted. Some kinds are made close and dense in texture, for carrying such seed as poppy or rape and sugar; others less close are used for rice, pulses, and seeds of like size, and coarser and opener kinds again are woven for the outer cover of packages and for the sails of country boats. There is a thin close-woven cloth made and used as garments among the females of the aboriginal tribes near the foot of the Himalayas, and in various localities a cloth of pure jute or of jute mixed with cotton is used as a sheet to sleep on, as well as for wearing purposes. To indicate the variety of uses to which jute is applied, the following quotation may be cited from the official report of Hem Chunder Kerr as applying to Midnapur. "The articles manufactured from jute are principally (1) gunny bags; (2) string, rope, and cord; (3) *kampa*, a net-like bag for carrying wood or hay on bullocks; (4) *chat*, a strip of stuff for tying bales of cotton or cloth; (5) *dola*, a swing on which infants are rocked to sleep; (6) *shika*, a kind of hanging shelf for little earthen pots, etc.; (7) *dulina*, a floor cloth; (8) *beera*, a small circular stand for wooden plates used particularly in *poojahs;* (9) painter's brush and brush for white-washing; (10) *ghunsi*, a waist-band worn next to the skin; (11) *gochhdari*, a hair-band worn by women; (12) *mukbar*, a net bag used as muzzle for cattle; (13) *parchula*, false hair worn by players; (14) *rakhi-bandhan*, a slender arm-band worn at the Rakhi-poornima festival; and (15) *dhup*, small incense sticks burned at *poojahs.*" Raw jute fibre and old gunnies are also largely used throughout the presidency in the manufacture of paper.

The introduction of jute factories on the European system into Bengal has had a considerable influence on the domestic manufacture of jute, notwithstanding that a vast industry is still prosecuted in the ancient Hindu manner.

The following extracts from official tables will show the extent of this particular branch of industry.

The number of gunny bags imported into Calcutta amounted in 1877-78 to 21,446,000, in 1878-79 to 26,380,000, and in 1879-80 to 20,488,000.

The different districts which contributed chiefly to the trade during these three years are the following:—

Name of District.	1877-78.	1878-79.	1879-80.
	Number.	Number.	Number.
Dinajpur	3,790,000	8,641,000	6,195,000
Hooghly	8,257,000	6,920,000	5,994,000
24 Parganas	3,130,000	3,303,000	4,020,000
Pubna	2,951,000	2,532,000	2,658,000
Bardwan	.....	263,000	326,000
Purneah	494,000	547,000	260,000
Jalpaiguri	381,000	484,000	204,000
Rangpur	117,000	512,000	169,000

The gunny bags exported from Calcutta in the year 1877-78 numbered 79,384,000; in 1878-79, 82,635,000; and in 1879-80, 92,284,000.

It will be seen that the exports of bags exceed the quantity sent into Calcutta by no less than 57,938,000 bags in 1877-78, 56,255,000 in 1878-79, and 71,796,000 in 1879-80. This is of course due to the large manufacture in Calcutta and the suburbs.

The import trade of Calcutta in gunny cloth during the three years referred to was in round numbers as follows:—51,000 pieces in 1877-78, 70,000 in 1878-79, and 88,000 in 1879-80.

Out of the total supply, that of power-loom manufacture was 43,000 pieces in 1879-80, as compared with 19,000 pieces in 1878-79. The hand-made pieces amounted to 45,000, as compared with 51,000 in 1878-79.

The export of gunny cloth by sea was consigned as follows:—

	1878-79.			1879-80.		
	Power-Loom.	Hand-Loom.	Total.	Power-Loom.	Hand-Loom.	Total.
	Yards.	Yards	Yards.	Yards.	Yards	Yards.
To foreign ports	4,530,000	57,000	4,587,000	5,210,000	1,000	5,211,000
To Indian "	3,135,000	17,000	3,152,000	1,658,000	7,000	1,665,000
Total	7,665,000	74,000	7,739,000	6,868,000	8,000	6,876,000

Besides the registered supplies mentioned above, the returns show a large quantity of power-loom gunny cloth, amounting to 664,000 pieces, sent up country from Calcutta mills without passing the port commissioners wharves. The gross total of gunny cloth exported from Calcutta was 54,731,000 yds. in 1878-79, and 61,468,000 yds. in 1879-80.

Formerly America was the largest customer for Indian jute manufactures, very large quantities of gunny having been consigned to the United States for packing cotton and other merchandise. That demand, has, however, very largely fallen off, and now the Australian colonies and Burmah and the various East Indian ports are the principal places to which the manufactured articles are sent from Calcutta.

European Trade and Manufacture.—The occasional parcels of jute which were sent to the European market by the East India Company previous to the year 1830 appear to have been principally used for the making of door mats and similar purposes; but the whole quantity was at that date, and, as will be seen by the table, p. 884, for several years thereafter, quite insignificant. Some part of these imports found their way to Abingdon in Oxfordshire, a town in which the manufacture of carpets, sacking, and cordage was extensively prosecuted, and to the manufacturers of that town is due the credit of being the first in Great Britain to experiment with the fibre, making it into yarn and cloth. In 1833 a quantity of dyed yarn was sent from Abingdon to Dundee, then an important centre of the heavier flax manufactures, and there it attracted a good deal of attention. Consignments were soon thereafter received direct at Dundee and experimented with, but little or no real progress was made for a considerable time, for jute forms no exception to the general rule that the introduction of new textile fibres is attended with many difficulties before a successful issue is reached. The many unsuccessful attempts to convert it into yarn caused it to be disliked by the manufacturer, and the bad reputation it had acquired as to strength and durability made it no favorite in public estimation. Indeed, so far was prejudice carried against it that some of the manufacturers banished the fibre entirely from their works, fearing it might prove prejudicial to their interests. Among the circumstances which added materially to the rapid development of the jute trade, lying outside its natural growth owing to cheapness and other causes, were the war with Russia in 1854-56, which temporarily cut off the supplies of Russian flax and hemp, and the cotton famine which resulted from the civil war in America in 1861-63. Leaving these circumstances out of account, however, the growth of the jute trade has been remarkable and steady, as will be seen by the following table, embracing a period of fifteen years from 1865 to 1880, during which no such cause as those alluded to above affected the trade.

Manufacture.—In their general features the spinning and weaving of jute fabrics do not differ essentially as to machinery and processes from those employed in the manufacture of hemp and heavy flax goods. Owing, however, to the woody and brittle nature of the fibre, it has to undergo a preliminary treatment

peculiar to itself. The pioneers of the jute industry, who did not understand this necessity, or rather who did not know how the woody and brittle character of the fibre could be remedied, were greatly perplexed by the difficulties they had to encounter, the fibre spinning badly into a hard, rough, and hairy yarn owing to the splitting and breaking of the fibre. This peculiarity of jute, coupled also with the fact that the machinery on which it was first spun, although quite suitable for the stronger and more elastic fibres for which it was designed, required certain modifications to suit it to the weaker jute, was the cause of many annoyances and failures in the early days of the trade.

Batching and Softening.—The introduction of this preliminary process constituted the first important step in the practical solution of the difficulties of jute spinning. The process, in a great measure, supplies artificially that in which jute is naturally deficient. The mode of batching originally adopted was to divide the rolls or heads, taken from the bale, into four or five parts, each being about what a hand could grasp. These divisions, called stricks, were doubled up with a slight turn at the centre, and laid out in the floor in double rows, the roots and crop ends of the stricks overlapping each other, in the centre of the batch; each row when completed received a certain percentage of whale oil and water, and, according to the ideas of the person superintending, a mixture of ashes or other ingredients, supposed to have a softening tendency. These batches, which generally contained from 4 to 5 tons each, were allowed to lie from twenty-four to forty-eight hours, at the end of which time a slight fermentation caused by the oil and water was induced, and the batch was then considered ready for the preparation process. The hand process has now, however, been superseded by a more speedy and economical appliance. In order to get the fibre into that soft pliant condition so essential to the spinning operation, jute softeners or mangles have been introduced. Of these machines there are various types, but in their general outline and principle they are closely allied to each other. The machine consists of a double row of fluted rollers, generally from twelve to eighteen pairs, the one placed on the top of the other, so that the flutes longitudinally intersect each other. The rollers, when the machine is in motion, have a rippling reciprocating action, by which means the material passing through is rendered soft and pliant. In connection with this machine, and with the view of dispensing with the more cumbrous and expensive mode of batching already described, an apparatus is attached, and is so adjusted that the jute on passing through the rollers receives with great precision a proper allowance of oil and water. The quantity of oil used varies from half a gallon to one gallon per 400 lb bale, and the quantity of water, according as the atmosphere is dry or damp, is from 12 to 18 per cent. of the weight of material operated on.

Such qualities of jute as retain rough and hard root ends or "butts" require to undergo another preliminary process termed "snipping," by which these "butts" are combed out, and separated from the remainder of the fibre; these being torn and split up into the form of tow, may be so used in the subsequent preparing and spinning operations. A good deal of jute is now prepared at Calcutta by the snipping process instead of by cutting, the butts being thereby secured in a more useful and valuable condition.

The material, after being softened, and, if necessary, snipped, is passed on to the assorters, whose duty is to select the different qualities for the special uses to which they may be applied.

Spinning.—All the subsequent processes through which jute passes are essentially the same as those employed in the corresponding heavy manufactures of flax (see LINEN). As in the case of that fibre, there are two distinct processes of preparing yarn, viz., by "line" spinning and by "tow" spinning. If intended for line spinning, the long jute fibre is cut or rather broken into lengths of from 20 to 24 inches. It is then ready for hackling, spreading, drawing, and roving, just as in the parallel case of flax "line" spinning. Similarly in the tow spinning the fibre is first submitted to the breaker card, then the finishing card, after which it passes through the drawing frames and the roving frame, and then, as "rove" or rovings, it is ready for the spinning frame; but, in the case of some very heavy yarns, the material is spun direct on the roving frame.

The weights of jute yarn are estimated by the spindle of 14,400 yards, and the finest kinds spun are about "2 lb yarn," *i. e.*, yarn weighing 2 lb per spindle. The minimum weight commonly found in the market is, however, 7 lb, from which the yarn lists rise in sizes up to 40 lb, or to very much heavier weights for special purposes. The ruling feature of jute is its cheapness, and the great demand for jute manufactures arises in connection with rough and cheap fabrics, such as sacking and bagging, bale covers, hessians for upholstery purposes, etc., turpaulings, linings, pocketings, and backing for floorcloths, for which purpose it is woven in webs from 6 to 8 yards wide. It takes dye colors readily, which, however, are fugitive, and as dyed yarn it is woven into carpets, rugs, etc.; and woven and printed curtain cloths and tapestries are also made from jute. The fibre, however, is not worthy of being woven into elaborate and somewhat costly fabrics; and it is not likely that as a tapestry material it will take any permanent place. Jute also lends itself readily to the sophistication of more expensive fibrous materials, and is said to be employed in the adulteration of woven silks, more especially in such as are used for cheap ribbons, scarfs, etc. It can also be prepared to imitate human hair with remarkable closeness, and advantage of this is largely taken in making stage wigs.

Although a few jute factories have sprung up in several localities other than Dundee throughout the United Kingdom, notably in Glasgow, Aberdeen, and Barrow-in-Furness, and also in various parts of the Continent, Dundee is still the headquarters and controlling centre of the jute trade,—even many of the Bengal factories being owned by Dundee merchants. The following table shows the distribution of the trade and the number of persons finding employment in it for the United Kingdom at the respective dates mentioned:—

	Factories.			Spinning Spindles.			Doubling Spindles.		Power Looms.			Persons Employed.

[1] Exclusive of number of power-looms in one factory in Antrim.

Some of the Dundee factories are of enormous extent, that of Messrs. Cox Brothers, for example, covering 22 acres, and giving employment to 5000 persons, while the annual output of jute fabrics measures as much as 15,500 miles. (J. PA.)

JÜTERBOGK, JÜTERBOG, or JÜTERBOCK, the chief town of the circle Jüterbogk-Luckenwalde, in the government district of Potsdam and province of Brandenburg, Prussia, is situated on the Nuthe, 39 miles southwest of Berlin, with which it is connected by rail. It contains four Protestant churches, of which that of St. Nicholas, dating from the close of the 14th century. Jüterbogk carries on weaving and spinning both of flax and wool, and trades in the produce of those manufactures and in cattle. Vines are cultivated in the neighborhood. Jüterbogk appears in history as the scene of religious discussions in 1548 and 1575, of a treaty between Brandenburg and Saxony in 1611, and of the victory of the Swedes under Torstenson over the imperial troops under Gallas in 1644. Two miles southwest is the battlefield of Dennewitz, where Bülow defeated Ney and Oudinot, September 6, 1813. The population, including the garrison, was 7,102 in 1905; with the immediately adjacent villages of Damm and Neumarkt it was 9,927.

JUVENAL (DECIMUS JUNIUS JUVENALIS) has been more read and admired in modern times than any other Latin poet, with the exception of Virgil, Horace, and perhaps Ovid. The attraction which he has had, not for scholars only, but for men of letters and men of the world, is probably due less to any intrinsic superiority of genius,—for in genius he is not the equal of Lucretius or Catullus,—but to a quality of his writing to which one of the most recent and best of his English editors has drawn attention. "In depicting character," says Mr. Lewis,[1] "in drawing scenes, even in turns of expression, he is, of all ancient authors, the most distinctly modern." But besides this attraction, which is due to the fact that he wrote at a time when the interest in social life and manners had superseded that formerly felt in the commonwealth, he has his own peculiar value to students of antiquity. He closes the roll of the great writers of Rome, and is the last vital representative of her national spirit and genius. It is mainly from his representation that the picture of the social life of the imperial city during the first century of our era lives in the imagination of the world. He is the most effective satirist of Rome, not because he was the greatest writer who made satire his theme, but because the age in which he lived supplied the largest material for purely satiric representation, and because his eye was fixed on the more sombre aspects of his time to the exclusion of those happier or more genial aspects which are reflected in the pages of Statius, Martial, and Pliny. The first impression produced by the satire of Juvenal is more powerful than that produced by the satire of Horace, as the impression produced by the tragical and sensational incidents of life is greater than that produced by its ordinary course and its lighter humors. The final verdict as to their relative excellence need not be in accordance with the first impression, but will be determined by the abiding sense of truth and conformity with real life which each representation leaves upon us. But Juvenal does stand prominently out, not in ancient literature only, but in the literature of the world, as the typical example of a social satirist, writing with a serious purpose. The burning indignation to which he attributes the inspiration of his verse, and its not unfrequent accompaniment, the "censure of a sardonic laugh," are his distinguishing notes.

Nor is it only in respect of subject-matter and the spirit in which that is treated, but also in respect of literary form and style, that poetical satire find its typical representative in Juvenal. The systematic treatment of some special topic, the sustained rhetorical pitch, so unlike the natural conversational manner of Horace, at which the treatment is maintained, the strongly-drawn scenes and portraits illustrative of the theme, the effort to make every line effective by point and emphasis, which distinguish some of the great products of modern poetical satire, have their prototype in Juvenal. The frank communicativeness,—the impulse to establish a confidential relation with the reader,—which made the writings of Lucilius appear to a later generation like a "picture of his life" drawn by his own hand, and which gives to the satires of Horace all the charm of an autobiography, has altogether disappeared from the satire of Juvenal, and given place to an attitude almost as impersonal as that assumed in the letters of Junius. And this is the attitude which modern poetical satire for the most part maintains. It commands respect by the boldness and incisiveness of its assaults on classes and individuals, or it gains popularity by gratifying the natural love of detraction, but it leaves to the prose essayist and the novelist the humaner part of acting on the reader through his sympathies.

This absence from the writings of Juvenal of that personal element which played so large a part in the satires of Lucilius and Horace forces us to depend almost entirely on external evidence for our knowledge of his life. And our available external evidence is unfortunately very meagre and untrustworthy. After reviewing it all and reading it as far as possible by light derived from his own writings, we shall have to acknowledge that we know very little with certainty of his career, that the impression we form of his character and associations is indistinct and perhaps fallacious, and that even the indications which seem to fix the date of the composition of various satires may be misleading. Still, in order to read his writings with full profit and pleasure, we must try to bring ourselves in thought as near to the writer as our knowledge admits of. The ideal presentation of human life and character in an epic poem or drama bears its own evidence of its truth. It either conforms to, or fails to conform to, what the imagination conceives of the capabilities of human nature. In reading the realistic representation of an exceptional phase of society, we wish to know whether the painter of it was, from his position, likely to have seen and understood it, whether his object was to describe it as he saw it, and whether he was a man capable of judging it reasonably and candidly.

A brief account of Juvenal's life, varying considerably in some of its details, is prefixed to the different MSS. of his works. But the original on which these various versions of the life are founded cannot be traced to Suetonius or to any competent authority, and some of the statements contained in it are intrinsically improbable. According to the form prefixed to the most valuable of the MSS., "Juvenal was the son or ward of a wealthy freedman; he practised declamation till middle age, not as a professional teacher, but as an amateur, and made his first essay in satire by writing the lines on Paris, the actor and favorite of Domitian, now found in the seventh satire (line 90 *sq.*):—

'Quod non dant proceres, dabit histrio,' etc.

Encouraged by their success, he devoted himself diligently to this kind of composition, but refrained for a long time from either publicly reciting or publishing his verses. When at last he did come before the public, his recitations were attended by great crowds and received with the utmost favor. But the lines originally written on Paris, having been inserted in one of his new satires, excited the jealous anger of an actor of the time, who was a favorite of the emperor, and procured the poet's banishment under the form of a military appointment to the extremity of Egypt. Being then eighty years of age, he died shortly af-

[1] *D Junii Juvenalis Satiræ, with a literal English prose translation and notes*, by John Delaware Lewis, M. A.

terwards of grief and vexation." In one account the time of his banishment is said to have been the last years of Domitian; in another he is said to have been appointed to a command against the Scots by Trajan, in another to have died in exile in the reign of Antoninus Pius, and in another to have died of a broken heart on his return to Rome, because he found his friend Martial was no longer there. One account even makes Claudius the author of his banishment. In several Aquinum is mentioned as his birthplace, and in one he is said to have been born in the time of Claudius.

Some of these statements are so much in consonance with the indirect evidence afforded by the satires that they might almost be supposed to be a series of conjectures based upon them. The rare passages in which the poet speaks of his own position, as in satires xi. and xii., indicate that he was in comfortable but moderate circumstances. We should infer also that he was not dependent on any professional occupation, and that he was separated in social station, and probably too by tastes and manners, from the higher class to which Tacitus and Pliny belonged, as he was by character from the new men who rose to wealth by servility under the empire. Juvenal is no organ of the pride and dignity, still less of the urbanity, of the cultivated representatives of the great families of the republic. He is the champion of the more sober virtues and ideas, and perhaps the organ of the rancors and detraction, of an educated but depressed and embittered middle class. The literary representative of such a class might well be found in the heir of a well-to-do freedman, born and bred in a provincial town, too independent both in position and character to become permanently a hanger-on of the great, and perhaps too ungracious in manner and uncompromising in speech to mix easily with the class which inherited the aristocratic and courtly traditions of Roman literature. The statement that he was a trained and practiced declaimer is confirmed both by his own words (i. 16.) and by the rhetorical mould in which his thoughts and illustrations are cast. The allusions which fix the dates when his satires first appeared, and the large experience of life which they imply, agree with the statement that he did not come before the world as a professed satirist till after middle age.

The statement that he continued to write satires long before he gave them to the world accords well with the nature of their contents and the elaborate character of their composition. They are not the expression of some passing impulse, but seem to sum up the experience of a lifetime. They have indeed the freshness of immediate impressions, but they are so combined as to show that they have been long brooded over before assuming their final form. And that he was known as a writer of satires for years before the publication of any of them in their present form might almost be inferred from the emphatic but yet guarded statement of Quintilian in his short summary of Roman literature. After speaking of the merits of Lucilius, Horace, and Persius as satirists, he adds, "There are, too, in our own day, distinguished writers of satire whose names will be heard of hereafter" (*Inst. Or.*, x. 1, 94). There is no Roman writer of satire who could be mentioned along with those others by so judicious a critic, and whose names have been heard of in after times, except Juvenal.

The motive which a writer of satire must have had for secrecy under Domitian is sufficiently obvious; and the necessity of concealment and self-suppression thus imposed upon the writer may have permanently affected his whole manner of composition.

So far the various authors of these lives have followed a probable and consistent tradition. But when we come to the story of the poet's exile, they are at variance both with probability and with one another. Some apparent confirmation is given to the tradition by the lines of a poet of the 5th century, Sidonius Apollinaris:—

> "Nec qui consimili deinde casu
> Ad vulgi tenuem strepentis auram
> Irati fuit histrionis exul."

There is no reason to doubt that these lines refer to Juvenal, but they only prove that the original story from which all the varying lives are derived was generally believed before the middle of the 5th century of our era. If Juvenal was banished at the age of eighty, the author of his banishment could not have been the "enraged actor" in reference to whom the original lines were written, as Paris was put to death in 83, and Juvenal was certainly writing satires long after 100 A. D. The satire in which the lines now appear was probably first published soon after the accession of Hadrian, when Juvenal was not an octogenarian, but in the maturity of his powers. The cause of the poet's banishment at that advanced age could not therefore have been either the original composition or the first publication of the lines. But it has been conjectured that the anger of another actor, a favorite of the emperor, may have been excited by a later application of them on some public occasion, and that the poet was punished for this unfortunate revival of lines which had never been intended for the person who resented them. Against this conjecture, based on a number of confused, uncertain, and contradictory traditions, we have to weigh the intrinsic improbability of the story. An expression in sat. xv. 45 is quoted as a proof that Juvenal had visited Egypt. He may have done so as an exile or in a military command; but it seems hardly consistent with the importance which the emperors attached to the security of Egypt, or with the concern which they took in the interests of the army, that these conditions were combined at an age so unfit for military employment. If any conjecture is warrantable on so obscure a subject, it is more likely that this temporary disgrace may have been inflicted on the poet by Domitian. Among the many victims of Juvenal's satire it is only against him and against one of the vilest instruments of his court, the Egyptian Crispinus, that the poet seems to be animated by personal hatred.[1] A sense of wrong suffered at their hands may perhaps have mingled with the detestation which he felt towards them on public grounds. But if he was banished under Domitian, it must have been either before or after the year 93 A. D., at which time, as we learn from an epigram of Martial, Juvenal was in Rome. The whole story may be ranked with the tradition of the love potion which is said to have maddened Lucretius, as one resting on such slight evidence as to admit neither of confirmation nor refutation.

More ancient and apparently more authentic evidence of the position filled by Juvenal during some period of his life has been recovered in recent times, in the form of an inscription found at Aquinum, recording, so far as it can be deciphered, the dedication of an altar to Ceres, by Junius Juvenalis, tribune of the first cohort of Dalmatians, "duumvir quinquennalis," and "flamen Divi Vespasiani." The terms of this incription, when read along with one of the few passages in the satires in which Juvenal distinctly speaks of himself (iii. 318 *sq.*)—

> "Et quotiens te
> Roma tuo refici properantem reddet Aquino,
> Me quoque ad Helvinam Cererem vestramque Dianam
> Convertet a Cumis: satirarum ego, ni pudet illas,
> Auditor gelidos veniam caligatus in agros—"

leaves little doubt that the author of the inscription was either the poet himself or some member of his family, of whose existence we have no other indication. If then, as is most probable, Juvenal is himself the author of it, we learn that he did hold, at one period of his life, a post of military rank, one of municipal importance in his native town, and a priesthood

[1] For the possible connection of Crispinus with Juvenal's banishment compare Mayor, vol. ii. p. 421.

of the deified Vespasian. But to what period of his life does this tablet bear evidence? The fact that he filled the position of "duumvir quinquennalis" shows that he was a man of influential position in the *municipium*, but the office was only held for a year,—the year apparently in which the census was taken at Rome,—and its tenure does not imply any prolonged absence from the metropolis. The satires, though they indicate an occasional preference for the simpler life of the country towns, are the product not of leisure in the provinces but of immediate and intimate familiarty with the life of the great city; and an epigram of Martial, written at the time when Juvenal was most vigorously employed in their composition, speaks of him as settled in Rome. It is possible, but not likely, that he may have retired to his native town in the latter years of his life, and that the last book of his satires (xiii.–xvi.), which contains no immediate references to Rome, and is written in a less angry mood than the earlier ones, may be the work of this retirement, and that it may have been during that time that he filled this office. On the other hand, it was by Domitian that the worship of Vespasian was established with especial sanctity, and it may be doubted whether a priesthood instituted in his honor would be recorded as a title of dignity late on in the reign of Hadrian. The lines already quoted from satire iii. imply that during his early career as a satirist Juvenal maintained his connection with Aquinum, and that he had some special interest in the worship of the "Helvinian Ceres." Nor is the tribute to the national religion implied by the dedication of the altar to Ceres inconsistent with the beliefs and feelings expressed in the satires. While the fables of mythology are often treated contemptuously or humorously by him, other passages in the satires clearly imply a conformity to and even a respect for the observances of the national religion.[1] The spirit of Juvenal, which sought for a standard of right action rather in the old Roman and Italian traditions than in the tenets of philosophy, would incline him to sympathize with the revival of religious observance and also of a kind of belief in divine agency on human affairs, which accompanied the establishment of the empire. The evidence as to the military post filled by him is curious, when taken in connection with the confused tradition of his exile in a position of military importance; and there appears to be some further evidence that the cohort of which he was tribune was quartered in Britain. But it cannot be said that the satires bear traces of military experience. The life described in them is such as would present itself to the eyes of a civilian, and would be talked about and commented on at the dinner tables and in the clubs, baths, theatres, and places of public resort in the great metropolis.[2]

The only other contemporary evidence which affords a glimpse of his actual life is contained in three epigrams of Martial. Two of these (vii. 24 and 91) were written in the time of Domitian, the other (xii. 18) early in the reign of Trajan, after Martial had retired to his native Bilbilis. The first of these epigrams, addressed to some backbiter who had endeavored to embroil the two friends with one another, attests the strong regard which Martial felt for him; but the subject of the epigram seems to hint that there may have been something suspicious or uneasy in the temper of the satirist, which made the maintenance of a steady friendship with him difficult. In the second of these epigrams, addressed to Juvenal himself, the epithet "facundus" is applied to him, one which might equally be employed whether he was best known at the time as a writer of poetic satires or as an eloquent rhetorician. In the last Martial imagines his friend wandering about discontentedly (*inquietus*) through the crowded streets of Rome, and undergoing all the discomforts incident to attendance on the levees of the great:

> "Dum per limina te potentiorum
> Sudatrix toga ventilat."

Two lines in the poem (22–3) suggest that the satirist who has inveighed with just severity against the worst corruptions of Roman morals, was not too rigid a censor of the morals of his friend. Indeed, his intimacy with Martial is a ground for not attributing to him exceptional strictness of life.

The additional information as to the poet's life and circumstances derivable from the satires themselves is not important. He tells us what might easily be inferred from the number of allusions to the Greek and Latin poets contained in his satires, that he had enjoyed the training which all educated men received in his day (i. 15); he indicates, as was mentioned above, his connection with the old Volscian town Aquinum; he speaks of his farm in the territory of Tibur (xi. 64), which furnished a young kid and mountain asparagus for a homely dinner to which he invites a friend during the festival of the Megalesiaca. In the satire in which this invitation is contained, and in one or two more of the later ones, he seems partially to remove the mask which he wears in the earlier and more directly aggressive satires. From it we are able to form an idea of the style in which he habitually lived, and to think of him as enjoying a hale and vigorous age (line 203), and also as a kindly master of a household (159 *sq.*). The negative evidence afforded in the account of his establishment, and the bitter tone in which his friend is reminded of his domestic unhappiness (186–9), suggest the inference that, like Lucilius and Horace, Juvenal had no personal experience of either the cares or the softening influence of family life. A comparison of this poem with the invitation of Horace to Torquatus (*Ep.*, i. 5) brings out strongly the differences not in urbanity only but in kindly feeling between the two satirists. It reminds us also of how much less we know of the one poet than of the other, and of how shadowy a personage the Persius of the one is as contrasted with the Torquatus of the other.

An excellent critic of Latin literature, M. Gaston Boissier, has drawn from the indications afforded of the career and character of the persons to whom the satires are addressed most unfavorable conclusions as to the social circumstances and associations of Juvenal. If we believe that the Trebius, Postumus, Ponticus, Nævolus, Persicus, of the satires were real people, with whom Juvenal lived in intimacy, we should conclude that he was most unfortunate in his associates, and that his own relations to them were marked rather by outspoken frankness than civility. But these personages seem to be more "nominis umbræ" than real men; they serve the purpose of enabling the satirist to aim his blows at one particular object instead of declaiming at large. They have none of the individuality and traits of personal character discernible in the Damasippus or Trebatius of Horace's satires, or the Julius Florus, the Torquatus, the Celsus, the Fuscus, the Bullatius, etc., of the epistles. It is noticeable that, while Juvenal writes of the poets and men of letters, Statius, Saleius Bassus, Quintilian, etc., of a somewhat earlier time, as if they were still living, he has no reference to the career or reputation of his friend Martial, and that he is equally silent about the two illustrious writers who wrote their works during the years of his own literary activity,—the younger Pliny and Tacitus. It is equally noticeable that among the many cultivated and estimable men and women who are brought before us in the correspondence of the former of these writers the name of Juvenal does not appear.

We feel on more certain ground in endeavoring to determine the times at which the satires were given to the world. But these do not in all cases coincide with those at which they were written and to which they immediately refer. Thus the manners and personages of the age of Domitian often supply the material of satiric representation, and are spoken of as if they belonged to the actual life of the present,[3]

[1] See especially xiii. 3–16.

[2] Comp. i, 145, "It nova nec tristis per cunctas fabula cenas;" xi. 3 *sq.*—

> "Omnis convictus, thermæ, stationes, omne theatrum
> De Rutilo."

[3] This is especially noticeable in the seventh satire, but it applies also to the mention of Crispinus, Latinus, the class of *delatores*

while allusions even in the earliest show that, as a finished literary composition, it belongs to the age of Trajan. The most probable explanation of these discrepancies is that already hinted at, viz., that in their present form the satires are the work of the last thirty years of the poet's life, while the first nine at least, the most powerful and most characteristic among them, not only reproduce the impressions of his earlier manhood, but may have preserved with little change passages written and perhaps familiarly known in his own literary circles during this earlier time. This seems more probable than that he should have used such famous names as those of Statius and Quintilian to signify some poet or rhetorical professor of a later time; although probably like Horace he may have availed himself either of false names, or names belonging to a former time, for his satiric nomenclature. The combinations of the impressions, and, perhaps of the actual compositions, of different periods also explain a certain want of unity and continuity found in some of them.

There is no reason to doubt that the sixteen satires which we possess were given to the world in the order in which we find them, and that they were divided, as they are referred to in the ancient grammarians, into five books. A minute examination of the various satires composing these books enables us to form at least a probable conjecture as to the intervals at which they appeared, and to conceive the changes of mood through which the poet passed during these intervals. Book I., embracing the first five satires, is written in the freshest vigor of the author's powers, and is animated with the strongest hatred of Domitian. The publication of this book belongs to the early years of Trajan. The mention of the exile of Marius (49) shows that it was not published before the year 100 A.D. In the second satire, the lines 29 *sq.*,

> "Qualis erat nuper tragico pollutus adulter
> Concubitu,"

show that the memory of one of the foulest scandals of the reign of Domitian was still fresh in the minds of men. The third satire, imitated by Johnson in his *London*, presents such a picture as Rome may have offered to the satirist at any time in the 1st century of our era; but it was under the worst emperors, Nero and Domitian, that the arts of flatterers and foreign adventurers were most successful, and that such scenes of violence as that described at 277 *sq.* were most likely to occur;[1] while the mention of Veiento (185) as still enjoying influence is a distinct reference to the court of Domitian. The fourth, which alone has any political significance, and reflects on the emperor as a frivolous trifler rather than as a monster of lust and cruelty, is the reproduction of a real or imaginary scene from the reign of Domitian, and is animated by the profoundest scorn and loathing both of the tyrant himself and of the worst instruments of his tyranny. The fifth is a social picture of the degradation to which poor guests were exposed at the banquets of the rich, but many of the epigrams of Martial and the more sober evidence of one of Pliny's letters show that the picture painted by Juvenal, though perhaps exaggerated in coloring, was drawn from a state of society prevalent during and immediately subsequent to the times of Domitian.[2] The second book contains the most elaborate of the satires, that which by many critics is regarded as the poet's masterpiece, the famous sixth satire, directed against the whole female sex, which shares with Domitian and his creatures the most cherished place in the poet's antipathies. It shows certainly no diminution of vigor either in its representation or its invective. If it is desirable that such a subject should be treated in the spirit in which Juvenal has treated it, it may be regarded as fortunate that it has been done once for all with such power, with such freedom from the restraints imposed either by modesty or humanity, and with, apparently, such intimate knowledge, that no writer of later ages has attempted to rival it. The time at which this satire was composed cannot be fixed with certainty, but some allusions (lines 502, 407–11, 205, 555[3]) render it highly probable that it was given to the world in the later years of Trajan, and before the accession of Hadrian. The date of the publication of Book III., containing the seventh, eighth, and ninth satires, seems to be fixed by its opening line "Et spes et ratio studiorum in Cæsare tantum," to the first years after the accession of Hadrian. If the seventh satire stood alone, we might, from the notices of Statius, Quintilian, etc., regard it as probably belonging to the age of Domitian; nor is it unlikely that much of it was written then, and that the condition of poets and men of letters there described, with more of fellow-feeling than is apparent in most of his satires, is drawn from the life at Rome with which the poet was first familiar. But it is inconceivable that the complimentary language applied to "Cæsar" in the opening lines could have been meant for Domitian; and the new hopes which are held out for the neglected race of poets would naturally be suggested by the change from the rule of a great soldier, whose thoughts were chiefly bent on foreign conquest, to that of an accomplished lover of art, like Hadrian. In the eighth satire another reference is made (line 120) to the misgovernment of Marius in Africa as a recent event (*nuper*), and at line 51 there may be an allusion to the Eastern wars that occupied the last years of Trajan's reign. The ninth has no allusion to determine its date, but it is written with the same outspoken freedom as the second and the sixth, and belongs to the period when the poet's power was most vigorous, and his exposure of vice most uncompromising. In the fourth book, comprising the famous tenth, the eleventh, and the twelfth satires, the author appears more as a moralist than as a pure satirist. In the tenth, the theme of the "vanity of human wishes" is illustrated by great historic instances, rather than by pictures of the men and manners of the age; and though the declamatory vigor and power of expression in it are occasionally as great as in the earlier satires, and although touches of his saturnine humor, and especially of his misogyny, appear in all the satires of this book, yet their general tone shows that the white heat of his indignation is abated; and the lines of the eleventh, already referred to (199 *sq.*),

> "Spectent juvenes quos clamor et audax
> Sponsio, quos cultæ decet assedisse puellæ:
> Nostra bibat vernum contracta cuticula solem,"

leave no doubt that he was well advanced in years when they were written.

Two important dates are found in the last book, comprising satires xiii–xvi. At xiii. 16 Juvenal speaks of his friend Calvinus "as now past sixty years of age, having been born in the consulship of Fonteius."[4] There was a C. Fonteius Capito consul in 59 A.D., and L. Fonteius Capito in 67. If it is accepted that the different books of the satires appeared at different intervals, that the third book was given to the world after Hadrian's return to Rome (118 A.D.), and that some time must have elapsed between the appearance of the third and fourth books, and again between that of the fourth and fifth, the date referred to must be the latter of these, and thus the fifth and last book could not have been published till after the year 127 A.D. Again at xv. 27 an event is said to have happened in Egypt "nuper consule Junco," for which some editions read "Junio." There was a Junius consul in 119 A.D. Even if he were the person referred to, the word *nuper* (as at ii. 29, viii. 120) might well indicate a date of some ten or twelve years earlier than that of the composition of the satire. Recent investigations, however, make out that there was a L. Æmilius Juncus consul *suffectus* in 127 A.D. (see Mayor's note on the passage). The fifth book must therefore have been published some time after this date. More than the fourth, this book bears the marks of age, both in the milder tone of the sentiments expressed, and in the feebler power of composition exhibited. The last satire is left incomplete, and the authenticity both of it and of the fifteenth has been questioned, though on insufficient grounds.

The general conclusion arrived at is that the satires were published at different intervals, and for the most part, composed, under Trajan and Hadrian, between the years 100 and 130 A.D., or a year or two later, but that the most powerful in feeling and vivid in conception among them deal with the experience and impressions of the reign of Domitian, occasionally recall the memories or traditions of the times of Nero and Claudius, and reproduce at least one startling page from the annals of Tiberius.[5] The same overmastering

tores, etc., in the first, to the notice of Veiento in the third, of Rubellius Blandus in the eighth, of Gallicus in the thirteenth, etc.

[1] *Cf.* Tacitus, *Annals*, xiii. 25.

[2] Pliny's remarks on the vulgarity as well as the ostentation of his host imply that he regarded such behavior as exceptional, at least in the circle in which he himself lived (*Ep.*, ii. 6.)

[3] See Mr. Lewis's edition, p. 317.

[4] Friedländer supposes that, as Juvenal has hitherto addressed Calvinus in the second person, the "hic" refers to himself, and that in the words "Fonteio Consule natus" we have the date of the poet's own birth. But elsewhere we find the poet changing suddenly from the second to the third person when there can be no doubt that they both refer to the same individual, *e.g.* (v. 18)—

> "Votorum summa! quid ultra
> Quæris? habet Trebius, propter quod," etc.

[5] x. 56–107.

feeling which constrained Tacitus (*Agric.*, 2, 3), when the time of long endurance and silence was over, to recall the "memory of the former oppression," acted upon Juvenal. There is no evidence that these two great writers who lived and wrote at the same time, who were animated by the same hatred of the tyrant under whom the best years of their manhood were spent, and who both felt most deeply the degradation of their times, were even known to one another. They belonged to different social circles, Tacitus to that of the highest official and senatorial class, Juvenal apparently to the middle class and to that of the struggling men of letters; and this difference in position had much influence in determining the different bent of their genius, and in forming one to be a great national historian, the other to be a great social satirist. If the view of the satirist is owing to this circumstance more limited in some directions, and his taste and temper less conformable to the best ancient standards of propriety, he is also saved by it from prejudices to which the traditions of his class exposed the historian. But both writers are thoroughly national in sentiment, thoroughly masculine in tone. No ancient authors express so strong a hatred of evil. None of the other contemporary writers share this feeling. Pliny has the natural repugnance of a gentleman and honorable man to coarseness and baseness; but he liked to live with people of tastes and manners congenial to his own, and to see as little as possible of the corruption which existed under the surface of society. Martial, as a foreigner living in Rome, endowed with a lively observation and a keen capacity for pleasure, enjoyed whatever was enjoyable in the life around him, found in its excesses and perversions materials for his wit, and, after flattering the worst of the emperors assiduously through all his career, was ready with impartial sycophancy to flatter one of the best. The peculiar greatness and value of both Juvenal and Tacitus is that they did not shut their eyes to the evil through which they had lived, but deeply resented it,—the one with a vehement and burning passion, like the "sæva indignatio" of Swift, the other with perhaps even deeper but more restrained emotions of mingled scorn and sorrow like the scorn and sorrow of Milton when "fallen on evil days and evil tongues." The wickedness of the age brought out more strongly than at any previous time the opposition between good and evil. The idea of conscience, as the connecting bond between religion and morality, appears in greater prominence in Tacitus and Juvenal than in any other ancient writers.

There is a criticism of an eminent living writer,[1] to the effect that the secret of Juvenal's concentrated power consisted in this, that he knew what he hated, and that what he did hate was despotism and democracy. But it would be hardly true to say that the animating motive of his satire was political. It is true that he finds the most typical examples of lust, cruelty, levity, and weakness in the emperors and their wives,—in Domitian, Otho, Nero, Claudius, and Messalina. It is true also that he shares in the traditional idolatry of Brutus, that he strikes at Augustus in his mention of the "three disciples of Sulla," and that he has no word of recognition for what even Tacitus acknowledges as the beneficent rule of Trajan. So too his scorn for the Roman populace of his time, who cared only for their dole of bread and the public games, is unqualified. But it is only in connection with its indirect effects that he seems to think of despotism; and he has no thought of democracy at all. It is not for the loss of liberty and of the senatorian rule that he chafes, but for the loss of the old national manliness and self-respect, alike in the descendants of "the Latian boors"[2] and in the representatives of the Æmilii and the Fabii. There is no more grandly imaginative passage in all his satires than that in which he evokes the ghosts of those who died at Cremera and Cannæ (ii. 153 *sq.*) to shame the degenerate debauchees of his own time. While we feel that we know little or nothing of his career, while we may imagine that personal disappointment may have supplied some of the gall in which his pen is dipped, and may doubt whether his own life and associations would have justified him in acting as a severer censor on what most Romans regarded as permitted indulgences than Lucilius and Horace, we cannot doubt that both his intellect and character were of a most masculine strength, and that his hatred for all that corrupted the old national character and enfeebled the national intellect was sincere and consistent. This feeling explains his detestation of foreign manners and superstitions, his loathing not only of inhuman crimes and cruelties but of such derelictions from self-respect as the appearance of a Roman nobleman on the arena or even the more harmless indulgence of a taste for driving, his scorn of luxury and of art as ministering to luxury, his mockery of the poetry and of the stale and dilettante culture of his time, and perhaps, too, his indifference to the schools of philosophy and his readiness to identify all the professors of stoicism with the reserved and close-cropped puritans,—

> "Rarus sermo illis et multa libido tacendi
> Adque supercilio brevior coma,"[3]

who concealed the worst vices under an outward appearance of austerity. The great fault of his character, as it appears in his writings, is that he too exclusively indulged this mood. It is much more difficult to find what he loved and admired than what he hated. But it is characteristic of his strong nature that, where he does betray any sign of human sympathy or tenderness, it is for those who by their weakness and position are dependent on others for their protection,—as for "the peasant boy with the little dog, his playfellow,"[4] or, for "the homesick lad from the Sabine highlands, who sighs for his mother whom he has not seen for a long time, and for the little hut and the familiar kids."[5]

If Juvenal is to be ranked as a great moralist, it is not for his greatness and consistency as a thinker on moral questions. In the rhetorical exaggeration of the famous tenth satire, for instance, the highest energies of patriotism,—the gallant and desperate defence of great causes, by sword or speech,—are quoted as mere examples of disappointed ambition; and in the indiscriminate condemnation of the arts by which men sought to gain a livelihood, he leaves no room for the legitimate pursuits of industry. His services to morals do not consist in any positive contributions to the notions of active duty, but in the strength with which he has realized and expressed the restraining influence of the old Roman and Italian ideal of character, and also of that religious conscience which was becoming a new power in the world. Though he disclaims any debt to philosophy (xiii. 121), yet he really owes more to the "Stoica dogmata," then prevalent, than he is aware of. But his highest and rarest literary quality is his power of painting characters, scenes, incidents, and actions, whether from past history or from contemporary life. In this power, which is also the great power of Tacitus, he has few equals and perhaps no superior among ancient writers. The difference between Tacitus and Juvenal in power of representation is that the prose historian is more of an imaginative poet, the satirist more of a realist and a grotesque humorist. He can paint great historical pictures in all their detail—as in the famous representation of the fall of Sejanus,—or call them up with all their imaginative associations in a line or two, as for instance in these—

> "Atque ideo postquam ad Cimbros stragemque volabant
> Qui nunquam attigerant majora cadavera corvi;"

[1] Mr. Swinburne.

[2] Unde nefas tantum Latiis pastoribus? (ii. 127).

[3] ii. 14 *sq.*

[4] "Meliusne hic rusticus infans
Cum matre et casulis et conlusore catello," etc.—ix. 60.

[5] xi. 152, 153.

he can describe a character elaborately or hit it off with a single stroke; and in either case he fixes the impression which he desires to produce firmly in the mind. The picture drawn may be a caricature, or a misrepresentation of the fact,—as that of the father of Demosthenes, "blear-eyed with the soot of the glowing mass," etc.,—but it is, with rare exceptions, realistically conceived, and, as is well said by Mr. Lewis, it is brought before us with the vivid touches of a Defoe or a Swift. Still more happily the same editor has illustrated Juvenal's power as a realistic painter of scenes from contemporary life,—and of scenes which generally combine grotesque and humorous features with serious meaning,—by comparing him with the great pictorial satirist of the last century, Hogarth.[1] Yet even in this, his most characteristic talent, his proneness to exaggeration, the attraction which coarse and repulsive images have for his mind, and the tendency to sacrifice general effect to minuteness of detail not unfrequently mar his best effects.

The difficulty is often felt of distinguishing between a powerful rhetorician and a genuine poet,—and there is no writer about whom it is more difficult to determine to which of the two classes he belongs than about Juvenal. He himself knew and has well described (vii. 53 *sq.*) the conditions under which a great poet could flourish; and he felt that his own age was incapable of producing one. He has little sense of beauty either in human life or nature. Whenever such sense is evoked it is only as a momentary relief to his prevailing sense of the hideousness of contemporary life, or in protest to what he regarded as the enervating influences of art. Even his references to the great poets of the past indicate rather a *blasé* sense of indifference and weariness than a fresh enjoyment of them. Yet his power of touching the springs of tragic awe and horror is a genuine poetical gift, of the same kind as that which is displayed by some of the early English dramatists. But he is, on the whole, more essentially a great rhetorician than a great poet. His training, the practical bent of his understanding, his strong but morose character, the circumstances of his time, and the materials available for his art, all fitted him to rebuke his own age and all after times in the tones of a powerful preacher, rather than to charm them with the art of an accomplished poet. The composition of his various satires shows no negligence, but rather the excess of elaboration; but it produces the impression of mechanical contrivance rather than of organic growth. His movement is sustained and powerful, but there is no rise and fall in it. He seems to forget how much more telling indignation is when it is severely controlled, but allowed occasionally to break forth in blasting scorn and wrath, as it is in Tacitus, than when it shows itself as the habitual mood of the writer. The verse is most carefully constructed, and is also most effective, but it is so with the rhetorical effectiveness of Lucan, not with the musical charm of Virgil. It was calculated to bring down the applause of an excited audience, not to perpetuate its melody through all succeeding times. So, too, the diction is full, even to excess, of meaning, point, and emphasis. Few writers have added so much to the currency of quotation. But his style altogether wants the charm of ease and simplicity. It wearies by the constant strain after effect, its mock-heroics, and allusive periphrasis. It excites distrust by its want of moderation. It makes us long to return to nature and to the apparently more careless but really truer art and the lighter touch of the satirist of the Augustan age—

"Parcentis viribus atque
Extenuantis eas consulto."

On the whole no one of the ten or twelve really great writers whom ancient Rome produced leaves on the mind so mixed an impression, both as a writer and as a man, as Juvenal. He has little, if anything at all, of the high imaginative mood—the mood of reverence and noble admiration—which made Ennius, Lucretius, and Virgil the truest poetical representatives of the genius of Rome. He has nothing of the wide humanity of Cicero, of the urbanity of Horace, of the ease and grace of Catullus. Yet he represents another mood of ancient Rome, the mood natural to her before she was humanized by the lessons of Greek art and thought. If we could imagine the elder Cato living under Domitian, cut off from all share in public life, and finding no sphere for his combative and censorious energy except that of literature, we should perhaps understand the motives of Juvenal's satire and the place which is his due as a representative of the genius of his country. As a man he shows many of the strong qualities of the old Roman plebeian,—the aggressive boldness, the intolerance of superiority and privilege, which animated the tribunes in their opposition to the senatorian rule. Even where we least like him we find nothing small or mean to alienate our respect from him. Though he loses no opportunity of being coarse, he is not licentious; though he is often truculent, he cannot be called malignant. It is, indeed, impossible to say what motives of personal chagrin, of love of detraction, of the mere literary passion for effective writing, may have contributed to the indignation which inspired his verse. But the prevailing impression we carry away after reading him is that, in all his early satires, he was animated by a sincere and manly detestation of the tyranny and cruelty, the debauchery and luxury, the levity and effeminacy, the crimes and frauds, which we know from other sources were rife in Rome in the century in which Christianity made its first converts there, and that a more serene wisdom and a happier frame of mind were attained by him when old age had somewhat allayed the fierce rage which vexed his manhood.

It would be impossible to enumerate here the various editions and works forming the literature connected with Juvenal which have sprung up between the appearance of the *editio princeps* in 1470 and the present day. They occupy more than five pages of E. Hübner's *Grundriss zu Vorlesungen über die Römische Literaturgeschichte.* Among the best critical editions of the text is that of O. Jahn, and among those which may be most recommended to students are the editions of Heinrich, Macleane, Mayor, and Lewis. The last is accompanied by a literal prose translation. The verse translations of Dryden and Gifford, and Johnson's imitations of the third and tenth satires in the *London* and *Vanity of Human Wishes*, will convey to readers ignorant of Latin a good impression of the power of the original. There is no better criticism of Juvenal as a writer than that contributed by the late Professor Ramsay to Dr. Smith's *Dictionary of Ancient Biography and Mythology.* (W. Y. S.)

JUXON, William (1582–1663), archbishop of Canterbury, was born at Chichester in 1582. Through the interest of his father with the Company of Merchant Taylors he received an appointment to their school, after which he entered St. John's College, Oxford, where he was elected a fellow in 1598. In 1603 he became a student of Gray's Inn, but afterwards he took holy orders, and in 1609 had become vicar of St. Giles, Oxford, an appointment which he resigned for the rectorship of Somerton, Oxfordshire, in 1615. On the recommendation of Laud he succeeded him in November, 1621, as president of St. John's College; and in 1626 he became vice-chancellor of the university. Having by the continued favor of Laud been promoted successively dean of Worcester, prebendary of Chichester, bishop of Hereford, and bishop of London, he attained finally a dignity outside the ordinary sphere of ecclesiastical aspiration, by being appointed in 1625 to the office of lord high treasurer. The appointment, unusual in itself, was preposterously beyond Juxon's claims, but his strict probity, his prudence, and his quiet and conciliating behavior won him the regard and goodwill even of those most opposed to him in politics. He resigned

[1] Lewis, *Introduction*, p. 215.

this office in 1641. Charles I. chose Juxon to administer to him the last consolations of religion. During the period of puritan ascendency the bishop retired to his estate of Little Compton, Gloucestershire, where he kept a pack of hounds much famed in the district. At the Restoration he was, on September 20, 1660, promoted to the see of Canterbury. He died at Lambeth palace, June 4, 1663.

Juxon was the author of the *Subjects' Sorrow, or Lamentations upon the Death of Britain's Josiah, King Charles, a Sermon*, 1660, and *Some considerations upon the Act of Uniformity*, 1662. See *Memoirs of Archbishop Juxon and his Times, Oxford*, 1869

K

K. THE letter K has remained with singularly little change in form even from the Phœnician alphabet down to the present time. It represents the guttural momentary sound produced by raising the back of the tongue to the back of the palate; it is surd, corresponding to G, which is sonant; and it has this value and no other in all modern alphabets in which it is found. In many alphabets, however, it is supplanted wholly or to a great extent by the symbol C. The reason of this has been already explained under the letters C and G. The substitution of C for K took place in Italy,—the original character surviving only in a few well-understood abbreviations; and in consequence of this those alphabets which have been derived from Italy naturally have the C; while those derived directly from the Greek, *e.g.*, the Gothic, which came through Ulfilas, and the different alphabets which trace back to Cyril (see ALPHABET), have only the K. In German we find K, with the exception of some words borrowed from other languages, *e.g.*, Cabinet, Cardinal, Caprice, etc.; but even foreign words when thoroughly naturalized take the German spelling, *e.g.*, Karte, Kammer, Onkel, etc. In French, on the other hand, K is found only in a few foreign words, and even these are merely names of men or countries. In England the large admixture of French words in the Teutonic language has produced some irregularity in spelling; but the K is not found (as might have been expected) in the Teutonic words, because the Roman alphabet was introduced by missionaries into England, and therefore the oldest English (or Anglo-Saxon) writings regularly have C and not K. The letter was introduced probably first in words borrowed from the German (thus in Alfred's version of Gregory's *Pastoral* we find "kyeglum" (p. 297, l. 1, ed. Sweet), the dative of the German "Kugel," or through German influence, as for example in the *Blickling Homilies* of the 10th century, we find "kyning" p. 163, l. 23, ed. Morris), beside the much more common "cyning." It would have been very convenient both in English and in other languages of modern Europe if K could have been kept as the sole symbol for the pure sound, and C as the symbol for a common corruption of it, now to be described.

This corruption is due to palatization; the middle instead of the back of the tongue is raised against the palate, and the result is the difference of sound between, *e.g.*, "kirk" and "church." This corruption was common in Sanskrit, and a special symbol was assigned to the sound. It is found in late Latin, especially before an *i*; and so it passed into Italian, where *c* is regularly sounded as our *ch* before *e* and *i*; in the words where the sound remained unchanged the symbol *ch* is employed to represent *k*, *e.g.*, in "che." In French the change was much greater; here *c* passed into the *sh*-sound (denoted by *ch*) before *a*, *e.g.*, in "chambre" from "camera," "chaud" from "calidus"; observe that the symbol *ch* has just the opposite value to the Italian one; while before *e* and *i* the sound underwent a still greater change; it sank into the simple sibilant *s*, *e.g.*, "civitas"—pronounced in Latin "kīvitas"—became "cité," whence our own sound; "certus" became "certein." In English, palatization has been very extensive; thus Old English "cese" (sounded like German "käse") became "cheese," "cild" became "child," etc.; here dialectic variation may often be seen, *e.g.*, in Alnwick but Norwich, Caistor but Chester.

Another still greater change of K has been called "labialization": this is the passage of the *k*-sound through an intermediate *kw* into *p*. This was common in Greek, where, *e.g.*, we find *ἕπομαι*, *τρέπω*, of which the root form as shown by other languages was SAK, TARK; in Latin we have the transitional forms "sequ-or," "torqu-eo"; in the Italian dialects the change was complete, *e.g.*, Oscan "pid" corresponded to Latin "quid." and Umbrian "pumpe" to "quomque." This change arose from a slight rounding of the lips while the speech-organs were in the position for *k*-sound; this produced a more or less distinct *kw* according to the amount of the rounding, passing finally into *p*, when the rounding amounted to absolute closing of the lips. For the intermediate sound the Latin employed the symbol Q, which is a slightly turned form of the original ϙ (Koppa) taken by the Greeks from the Phœnician, but not required by them, and therefore suffered to fall out except in numeration; the Latin took it on, and, if it had consistently employed it alone to denote the slightly labialized *k*, the result would have been good; but it regularly added *u* to it (QU), so that the Q might as well have been written K. The superfluous letter passed on to the French and English languages.

There is reason for believing that this labializing tendency is very old,—as old indeed as the Indo-European language itself. It is probable that that language had both the *k* pure and another with a slight *w* sound following it. This appears from the fact (first thoroughly ascertained by Fick) that in one set of cognate words which had an original *k*, we find *ch* in Sanskrit, *κ* or *π* in Greek, *c* or *qu* in Latin, *k* in Lithuanian and Sclavonic; in another set we find *ç* in Sanskrit, *sz* (which is our *sh*-sound) in Lithuanian, *s* in Slavonic, but only *k* in Greek and *c* in Latin; that is, in one set we see the phenomenon of labialism, in the other assibilation but no touch of labialism; from which we infer that the assibilated *k* in the derived languages traces back to *k* pure, the labialized *k* to a sound which in the original language was at least slightly modified from *k*. An instance of the assibilation may be seen in the correspondence of Sanskrit "çatam," Lithuanian "szimtas," to Latin "centum," Greek *ἑκατόν*; neither in Greece nor in Italy is there any labialized form of this word.

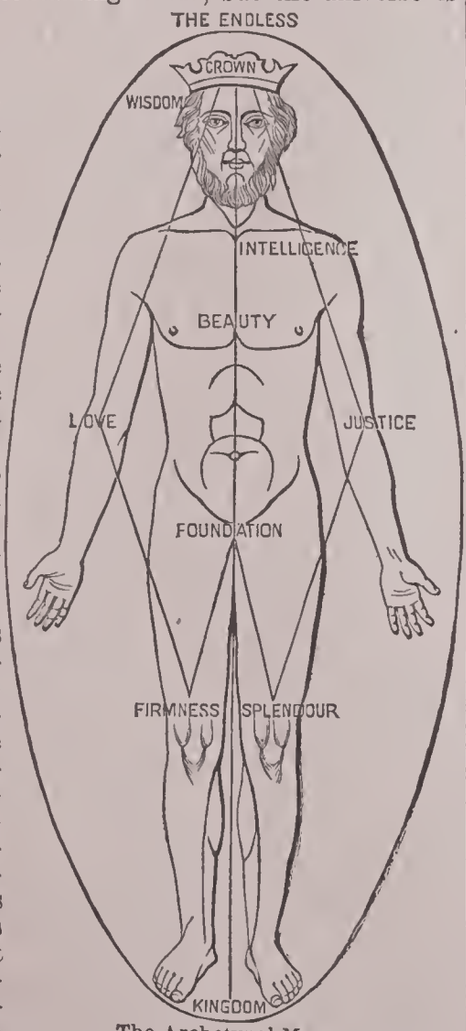
KAABA, Ka'ba, or KAABEH, the sacred shrine of Mahometanism, containing the "black stone," in the middle of the great mosque at Mecca. See ARABIA, vol. ii, p. 223, and MECCA.

KAADEN, chief town of a department in the circle of Eger, Bohemia, is situated on the Eger, about 60 miles northwest of Prague. The town lies about 2 miles E. of the station of Kaaden-Brunnersdorf, on the railway between Eger and Carlsbad, and consists of an old town, surrounded by a wall, and two suburbs, It contains two convents, a commercial school, and a school of agriculture. The chief buildings are the Late Gothic Franciscan church, and the town-house with a noteworthy tower. The manufactures include gloves and beet-root sugar; there is some trade in wood and grain; and mining for anthracite and a mineral color-

ing material, yielding *Kaaden green*, is carried on in the neighborhood. Kaaden was founded about 820; in 1277 it became a free city; and in 1534 it saw the conclusion of a peace between Ferdinand I., king of the Romans, and Ulrich I., duke of Würtemberg. The population in 1900 was 7,485.

KABBALAH is now used as the technical name for the system of theosophy which began to be developed among the Jews in the 10th century, and which has also played an important part in the Christian church since the Middle Ages. The term primarily denotes "reception" and then "doctrines received by tradition." In the older Jewish literature the name is applied to the whole body of received religious doctrine with the exception of the Pentateuch, thus including the Prophets and Hagiographa as well as the oral traditions ultimately embodied in the Mishnah. It is only since the 11th or 12th century that Kabbalah has become the exclusive appellation for the renowned system of theosophy which claims to have been transmitted uninterruptedly by the mouths of the patriarchs and prophets ever since the creation of the first man.

The cardinal doctrines of the Kabbalah embrace the nature of the Deity, the Divine emanations or Sephiroth, the cosmogony, the creation of angels and man, their destiny, and the import of the revealed law. According to this esoteric doctrine, God, who is boundless and above everything, even above being and thinking, is called *En Soph* (ἄπειρος); He is the space of the universe containing τὸ πᾶν, but the universe is not his space. In this boundlessness He could not be comprehended by the intellect or described in words, and as such the En Soph was in a certain sense *Ayin*, non-existent (*Zohar*, iii. 283). To make his existence known and comprehensible, the En Soph had to become active and creative. As creation involves intention, desire, thought, and work, and as these are properties which imply limit and belong to a finite being, and moreover as the imperfect and circumscribed nature of this creation precludes the idea of its being the direct work of the infinite and perfect, the En Soph had to become creative, through the medium of ten Sephiroth or intelligences, which emanated from him like rays proceeding from a luminary.



The Archetypal Man.

Now the wish to become manifest and known, and hence the idea of creation, is co-eternal with the inscrutable Deity, and the first manifestation of this primordial will is called the first *Sephira* or emanation. This first Sephira, this spiritual substance which existed in the En Soph from all eternity, contained nine other intelligences or *Sephiroth*. These again emanated one from the other, the second from the first, the third from the second, and so on up to ten.

The ten Sephiroth, which form among themselves and with the En Soph a strict unity, and which simply represent different aspects of one and the same being, are respectively denominated (1) the Crown, (2) Wisdom, (3) Intelligence, (4) Love, (5) Justice, (6) Beauty, (7) Firmness, (8) Splendor, (9) Foundation, and (10) Kingdom. Their evolution was as follows: "When the Holy Aged, the concealed of all concealed, assumed a form, he produced everything in the form of male and female, as things could not continue in any other form. Hence Wisdom, the second Sephira, and the beginning of development, when it proceeded from the Holy Aged (another name of the first Sephira) emanated in male and female, for Wisdom expanded, and Intelligence, the third Sephira, proceeded from it, and thus were obtained male and female, viz., Wisdom the father and Intelligence the mother, from whose union the other pairs of Sephiroth successively emanated" (*Zohar*, iii. 290). These two opposite potencies, viz., the masculine Wisdom or Sephira No. 2 and the feminine Intelligence or Sephira No. 3 are joined together by the first potency, the Crown or Sephira No. 1; they yield the first triad of the Sephiric decade, and constitute the divine head of the archetypal man, as will be seen in the accompanying figure.

From the junction of Sephiroth No. 2 and 3 emanated the masculine potency Love or Mercy (4) and the feminine potency Justice (5), and from the junction of the latter two emanated again the uniting potency Beauty (6). Beauty, the sixth Sephira, constitutes the chest in the archetypal man, and unites Love (4) and Justice (5), which constitute the divine arms, thus yielding the second triad of the Sephiric decade. From this second conjunction emanated again the masculine potency Firmness (7) and the feminine potency Splendor (8), which constitute the divine legs of the archetypal man; and these sent forth Foundation (9), which is the genital organ and medium of union between them, thus yielding the third triad in the Sephiric decade. Kingdom (10), which emanated from the ninth Sephira, encircles all the other nine, inasmuch as it is the Shechina, or divine halo, which encompasses the whole by its all-glorious presence.

In their totality and unity the ten Sephiroth are not only denominated the World of Sephiroth, or the World of Emanations, but, owing to the above representation, are called the primordial or archetypal man (= πρωτόγονος) and the heavenly man. It is this form, which, as we are assured, the prophet Ezekiel saw in the mysterious chariot (Ezek. i. 1–28), and of which the earthly man is a faint copy.

As the three triads respectively represent intellectual, moral, and physical qualities, the first is called the Intellectual, the second the Moral or Sensuous, and the third the Material World. In the figure of the archetypal man it will be seen that the three Sephiroth on the right are masculine, and represent the principle of rigor, that the three on the left are feminine and represent the principle of mercy, and that the four central or uniting Sephiroth represent the principle of mildness. Hence the right is called "the Pillar of Judgment," the left "the Pillar of Mercy," and the centre "the Middle Pillar." The middle Sephiroth are synecdochically used to represent the worlds or triads of which they are the uniting potencies. Hence the Crown, the first Sephira, which unites Wisdom and Intelligence to constitute the first triad, is by itself denominated the Intellectual World. So Beauty is by itself described as the Sensuous World, and in this capacity is called the Sacred King or simply the King, whilst Kingdom, the tenth Sephira, which unites all the nine Sephiroth, is used to denote the Material World, and as such is denominated the Queen or the Matron. Thus a trinity of units, viz., the Crown, Beauty, and Kingdom, is obtained within the

trinity of triads. But further, each Sephira is as it were a trinity in itself. It (1) has its own absolute character, (2) receives from above, and (3) communicates to what is below. "Just as the Sacred Aged is represented by the number three, so are all the other lights (Sephiroth) of a threefold nature" (*Zohar*, iii. 288). In this all-important doctrine of the Sephiroth, the Kabbalah insists upon the fact that these potencies are not creations of the En Soph, which would be a diminution of strength; that they form among themselves and with the En Soph a strict unity, and simply represent different aspects of the same being, just as the different rays which proceed from the light, and which appear different things to the eye, are only different manifestations of one and the same light; that for this reason they all alike partake of the perfections of the En Soph; and that as emanations from the Infinite, the Sephiroth are infinite and perfect like the En Soph, and yet constitute the first finite things. They are infinite and perfect when the En Soph imparts his fulness to them, and finite and imperfect when that fulness is withdrawn from them.

The conjunction of the Sephiroth, or, according to the language of the Kabbalah, the union of the crowned King and Queen, produced the universe in their own image. Worlds came into existence before the En Soph manifested himself in the human form of emanations, but they could not continue, and necessarily perished because the conditions of development which obtained with the sexual opposites of the Sephiroth did not exist. These worlds which perished are compared to sparks which fly out from a red-hot iron beaten by a hammer, and which are extinguished according to the distance they are removed from the burning mass. Creation is not *ex nihilo;* it is simply a further expansion or evolution of the Sephiroth. The world reveals and makes visible the Boundless and the concealed of the concealed. And, though it exhibits the Deity in less splendor than its Sephiric parents exhibit the En Soph, because it is farther removed from the primordial source of light than the Sephiroth, still, as it is God manifested, all the multifarious forms in the world point out the unity which they represent. Hence nothing in the whole universe can be annihilated. Everything, spirit as well as body, must return to the source whence it emanated (*Zohar*, ii. 218). The universe consists of four different worlds, each of which forms a separate Sephiric system of a decade of emanations. They were evolved in the following order. (1) The World of Emanations, also called the Image and the Heavenly or Archetypal Man, is, as we have seen, a direct emanation from the En Soph. Hence it is most intimately allied to the Deity, and is perfect and immutable. From the conjunction of the King and Queen (*i. e.*, these ten Sephiroth) is produced (2) the World of Creation, or the Briatic world, also called "the Throne." Its ten Sephiroth, being farther removed from the En Soph, are of a more limited and circumscribed potency, though the substances they comprise are of the purest nature and without any admixture of matter. The angel Metatron inhabits this world. He alone constitutes the world of pure spirit, and is the garment of Shaddai, *i. e.*, the visible manifestation of the Deity. His name is numerically equivalent to that of the Lord (*Zohar*, iii. 231). He governs the visible world, preserves the harmony and guides the revolutions of all the spheres, and is the captain of all the myriads of angelic beings. This Briatic world again gave rise to (3) the World of Formation, or Yetziratic World. Its ten Sephiroth, being still farther removed from the Primordial Source, are of a less refined substance. Still they are yet without matter. It is the abode of the angels, who are wrapped in luminous garments, and who assume a sensuous form when they appear to men. The myriads of the angelic hosts who people this world are divided into ten ranks, answering to the ten Sephiroth, and each one of these numerous angels is set over a different part of the universe, and derives his name from the heavenly body or element which he guards (*Zohar*, i. 42). From this world finally emanated (4) the World of Action, also called the World of Matter. Its ten Sephiroth are made up of the grosser elements of the former three worlds; they consist of material substance limited by space and perceptible to the sense in a multiplicity of forms. This world is subject to constant changes and corruption, and is the dwelling of the evil spirits. These, the grossest and most deficient of all forms, are also divided into ten degrees, each lower than the other. The first two are nothing more than the absence of all visible form and organization; the third degree is the abode of darkness; whilst the remaining seven are "the seven infernal halls," occupied by the demons, who are the incarnation of all human vices. These seven hells are subdivided into innumerable compartments corresponding to every species of sin, where the demons torture the poor deluded human beings who have suffered themselves to be led astray whilst on earth. The prince of this region of darkness is Sāmāel, the evil spirit, the serpent who seduced Eve. His wife is the Harlot or the Woman of Whoredom. The two are treated as one person, and are called "the Beast" (*Zohar*, ii. 255–259, with i. 35).

The whole universe, however, was incomplete, and did not receive its finishing stroke till man was formed, who is the acme of the creation and the microcosm. "The heavenly Adam (*i. e.*, the ten Sephiroth) who emanated from the highest primordial obscurity (*i. e.*, the En Soph) created the earthly Adam" (*Zohar*, ii. 70). "Man is both the import and the highest degree of creation, for which reason he was formed on the sixth day. As soon as man was created everything was complete, including the upper and nether worlds, for everything is comprised in man. He unites in himself all forms" (*Zohar*, iii. 48). Each member of his body corresponds to a part of the visible universe. "Just as we see in the firmament above, covering all things, different signs which are formed of the stars and the planets, and which contain secret things and profound mysteries studied by those who are wise and expert in these things; so there are in the skin, which is the cover of the body of the son of man, and which is like the sky that covers all things above, signs and features which are the stars and planets of the skin, indicating secret things and profound mysteries whereby the wise are attracted who understand the reading of the mysteries in the human face" (*Zohar*, ii. 76). The human form is shaped after the four letters which constitute the Tetragrammaton. The head is in the shape of י, the arms and the shoulders are like ה, the breast like ו, and the two legs with the back again resemble ה (*Zohar*, ii. 72). The souls of the whole human race pre-exist in the World of Emanations, and are all destined to inhabit human bodies. Like the Sephiroth from which it emanates, every soul has ten potencies, consisting of a trinity of triads. (1) The Spirit (נְשָׁמָה), which is the highest degree of being, corresponds to and is operated upon by the Crown, which is the highest triad in the Sephiroth, and is called the Intellectual World; (2) the Soul (רוּחַ), which is the seat of the moral qualities, corresponds to and is operated upon by Beauty, which is the second triad in the Sephiroth, and is called the Moral World; and (3) the Cruder Soul (נֶפֶשׁ), which is immediately connected with the body, and is the cause of its lower instincts and the animal life, corresponds to and is operated upon by Foundation, the third triad in the Sephiroth, called the Material World. Each soul, prior to its entering into this world, consists of male and female united into one being. When it descends on this earth the two parts are separated and animate two different bodies. "At the time of marriage the Holy One, blessed be he, who knows all souls and spirits, unites them again

as they were before; and they again constitute one body and one soul, forming as it were the right and the left of the individual. . . . This union, however, is influenced by the deeds of the man and by the ways in which he walks. If the man is pure and his conduct is pleasing in the sight of God, he is united with that female part of the soul which was his component part prior to his birth" (*Zohar*, i. 91). The soul's destiny upon earth is to develop those perfections the germs of which are eternally implanted in it, and it ultimately must return to the infinite source from which it emanated. Hence, if, after assuming a body and sojourning upon earth, it becomes polluted by sin and fails to acquire the experience for which it descends from heaven, it must three times reinhabit a body, till it is able to ascend in a purified state through repeated trials. If, after its third residence in a human body, it is still too weak to withstand the contamination of sin, it is united with another soul, in order that by their combined efforts it may resist the pollution which by itself it was unable to conquer. When the whole pleroma of pre-existent souls in the world of the Sephiroth shall have descended and occupied human bodies and have passed their period of probation and have returned purified to the bosom of the infinite Source, then the soul of Messiah will descend from the region of souls; then the great Jubilee will commence. There shall be no more sin, no more temptation, no more suffering. Universal restoration will take place. Satan himself, "the venomous Beast," will be restored to his angelic nature. Life will be an everlasting feast, a Sabbath without end. All souls will be united with the Highest Soul, and will supplement each other in the Holy of Holies of the Seven Halls (*Zohar*, i. 45, 168; ii. 97).

According to the Kabbalah all these esoteric doctrines are contained in the Hebrew Scriptures. The uninitiated cannot perceive them; but they are plainly revealed to the spiritually minded, who discern the profound import of this theosophy beneath the surface of the letters and words of Holy Writ. "If the law simply consists of ordinary expressions and narratives, such as the words of Esau, Hagar, Laban, the ass of Balaam, or Balaam himself, why should it be called the law of truth, the perfect law, the true witness of God? Each word contains a sublime source, each narrative points, not only to the single instance in question, but also to generals" (*Zohar*, iii. 149, *cf.* 152).

To obtain these heavenly mysteries, which alone make the Torah superior to profane codes, definite hermeneutical rules are employed, of which the following are the most important. (1) The words of several verses in the Hebrew Scriptures which are regarded as containing a recondite sense are placed over each other, and the letters are formed into new words by reading them vertically. (2) The words of the text are ranged in squares in such a manner as to be read either vertically or boustrophedon. (3) The words are joined together and redivided. (4) The initials and final letters of several words are formed into separate words. (5) Every letter of a word is reduced to its numerical value, and the word is explained by another of the same quantity. (6) Every letter of a word is taken to be the initial or abbreviation of a word. (7) The twenty-two letters of the alphabet are divided into two halves; one half is placed above the other; and the two letters which thus become associated are interchanged. By this permutation, *Aleph*, the first letter of the alphabet, becomes *Lamed*, the twelfth letter; *Beth* becomes *Mem*, and so on. This cipher alphabet is called *Albam*, from the first interchangeable pairs. (8) The commutation of the twenty-two letters is effected by the last letter of the alphabet taking the place of the first, the last but one the place of the second, and so forth. This cipher is called *Atbash*. These hermeneutical canons are much older than the Kabbalah. They obtained in the synagogue from time immemorial, and were used by the Christian fathers in the interpretation of Scripture. Thus Canon V., according to which a word is reduced to its numerical value and interpreted by another word of the same value, is recognized in the New Testament (*comp.* Rev. xiii. 18). Canon VI. is adopted by Irenæus, who tells us that, according to the learned among the Hebrews, the name Jesus contains two letters and a half, and signifies that Lord who contains heaven and earth [יהוה שמים וארץ—ישו] (*Against Heresies*, ii. xxiv., vol. i., p. 205, ed. Clark). The cipher *Atbash* (Canon VIII.) is used in Jeremiah xxv. 26, li. 41, where Sheshach is written for Babel. In Jer. li. 1, לֵב קָמַי *Leb-Kamai* (A. V., "the midst of them that rise up against me"), is written for כַּשְׂדִּים, *Chaldæa*, by the same rule.

It is necessary to advert to the relation between the Kabbalah and Christianity in order to account for the extraordinary part which this theosophy played in the Christian church, especially at the time of the Renaissance. We have already seen that the Sephiric decade, or the archetypal man, like Christ, is considered to be of a double nature, both infinite and finite, perfect and imperfect. More distinct, however, is the doctrine of the Trinity. On Deut. vi. 43, where Jehovah occurs first, then Elohēnū, and then again Jehovah, we are told "the voice, though one, consists of three elements, fire (*i.e.*, warmth), air (*i.e.*, breath), and water (*i.e.*, humidity), yet all three are one in the mystery of the voice and can only be one. Thus also Jehovah, Elohēnū, Jehovah, constitute one—three forms which are one" (*Zohar*, ii, 43; compare iii. 65). Discussing the three holy in Isaiah vi. 3, one codex of the *Zohar* had the following remark: "The first holy denotes the Holy Father, the second the Holy Son, and the third the Holy Ghost" (comp. Galatinus, *De Arcanis Cathol.*, lib. ii., c. 3, p. 31; Wolf, *Bibliotheca Hebraica*, i. 1136). Still more distinct is the doctrine of the atonement. "The Messiah invokes all the sufferings, pain, and afflictions of Israel to come upon Him. Now if He did not remove them thus and take them upon Himself, no man could endure the sufferings of Israel, due as their punishment for transgressing the law; as it is written (Isa. liii. 4), Surely He hath borne our griefs and carried our sorrows" (*Zohar*, ii. 12). These and similar statements favoring the doctrines of the New Testament have made many Kabbalists of the highest position in the synagogue embrace the Christian faith, and write elaborate books to win their Jewish brethren over to Christ. As early as 1450 a company of Jewish converts in Spain, at the head of which were Paul de Heredia, Vidal de Saragossa de Aragon, and Davila, published compilations of Kabbalistic treatises to prove from them the doctrines of Christianity. They were followed by Paul Riei, professor at Pavia, and physician to the emperor Maximilian I. Sharing the conviction of his fellow converts that the doctrines of the Kabbalah are the doctrines of Christianity, this eminent Hebraist translated into Latin the Kabbalistic work entitled *The Gates of Light*, which he dedicated to the emperor (1516). It was from this work that Pico de Mirandola and John Reuchlin learnt the true secrets of the Kabbalah. Prominent among the "nine hundred theses" which Mirandola had placarded in Rome, and which he undertook to defend in the presence of all European scholars, whom he invited to the Eternal City, promising to defray their travelling expenses, was the following: "No science yields greater proof of the divinity of Christ than magic and Kabbalah." Mirandola so convinced Pope Sixtus of the paramount importance of the Kabbalah as an auxiliary to Christianity that His Holiness exerted himself to have Kabbalistic writings translated into Latin for the use of divinity students. With equal zeal did Reuchlin act as the apostle of the Kabbalah. His treatises exercised an almost magic influence upon the greatest thinkers of the time. Pope Leo X. and the early Reformers were alike captivated by the charms of the Kabbalah as propounded by Reuchlin, and not only divines, but statesmen and warriors, began to study the Oriental languages in order to be able to fathom the mysteries of Jewish theosophy.

Though the followers of this theosophy claim two works as their codes, viz., the *Book of Creation* and the *Zohar*, it is really only the latter which is the Bible of the Kabbalists. The renowned *Zohar* is written in Aramaic, and is a commentary on the Penta-

teuch, according to its division into fifty-two hebdomadal lessons. It derives its name זוהר, *i.e.*, Light, from the words "Let there be light" (Gen. i. 4), with the exposition of which it begins. Interspersed throughout the *Zohar*, either as parts of the text with distinct titles or in separate columns, are the following eleven dissertations:—(1) "Additions and Supplements;" (2) "The Mansions and Abodes," describing the structure of paradise and hell; (3) "The Mysteries of the Pentateuch," describing the evolution of the Sephiroth, etc.; (4) "The Hidden Interpretation," deducing esoteric doctrine from the narratives in the Pentateuch; (5) "The Faithful Shepherd," recording discussions between Moses, the faithful shepherd, the prophet Elijah, and R. Simon b. Yochi, the reputed compiler of the *Zohar;* (6) "The Secret of Secrets," a treatise on physiognomy and psychology; (7) "The Aged," *i.e.*, the prophet Elijah, discoursing with R. Simon on the doctrine of transmigration as evolved from Exod. xxi. 1–xxiv. 18; (8) "The Book of Secrets," discourses on cosmogony and demonology; (9) "The Great Assembly," discourses of R. Simon to his numerous assembly of disciples on the form of the Deity and on pneumatology; (10) "The Young Man," discourses by young men of superhuman origin on the mysteries of ablutions; and (11) "The Small Assembly," containing the discourses on the Sephiroth which R. Simon delivered to the small congregation of six surviving disciples.

The *Zohar* pretends to be a compilation made by R. Simon b. Yochi, who flourished about 70–110 A.D., of doctrines which God communicated to Adam in Paradise, and which have been received uninterruptedly from the mouths of the patriarchs and prophets. Amongst the many facts, however, established by modern criticism which prove the *Zohar* to be a compilation of the 13th century, the following are the most prominent: (1) the *Zohar* itself praises most fulsomely R. Simon, its reputed author, and exalts him above Moses; (2) it mystically explains the Hebrew vowel points, which did not obtain till 570; (3) the compiler borrows two verses from the celebrated hymn called "The Royal Diadem," written by Ibn Gebirol, who was born about 1021; (4) it mentions the capture of Jerusalem by the crusaders and the retaking of the Holy City by the Saracens; (5) it speaks of the comet which appeared at Rome, July 15, 1264, under the pontificate of Urban IV.; (6) by a slip the *Zohar* assigns a reason why its contents were not revealed before 5060–66 A.M., *i. e.*. 1300–1306 A.D.; (7) the doctrine of the En Soph and the Sephiroth was not known before the 13th century; and (8) the very existence of the *Zohar* itself was not known prior to the 13th century. Hence it is now believed that Moses de Leon (*ob.* 1305), who first circulated and sold the *Zohar* as the production of R. Simon, was himself the author. That eminent scholars both in the synagogue and in the church should have been induced to believe in its antiquity is owing to the fact that the *Zohar* embodies many opinions and doctrines which obtained among the Jews prior to the time of Christ. The undoubted antiquity of these has served as a lever in the minds of these scholars to raise the late speculations about the En Soph, the Sephiroth, etc., to the same age.

Literature.—The *Zohar*, frequently published in 3 vols., the pagination of which, like that of the Talmud, is always the same; Baron von Rosenroth's *Kabbala Denudata*, Sulzbach, 1677–78, Frankfort, 1684; Azariel, *Commentary on the Doctrine of the Sephiroth*, Warsaw, 1798, Berlin, 1850; Id., *Commentary on the Song of Songs*, Altona, 1763; Franck, *La Kabbale*, Paris, 1843 (trans. by Jellinek, Leipsic, 1844); Graetz, *Geschichte der Juden*, vol. vii. 442–459; art. "Cabbalah," in Smith's *Dictionary of Christian Biography*, etc.; Ginsburg, *The Kabbalah, its Doctrines, Development, and Literature*, London, 1865. (C. D. G.)

KABUL. See CABUL.

KABYLES, or more correctly KABÁIL, a number of tribes in the Algerian region of Northern Africa, of special interest to the politician from the peculiarity of their institutions and from the part they will probably play in the development of the French colony, and to the ethnologist as the best known branch of the great Berber race. In 1864 it was estimated that they amounted to 2,200,000. The country which they inhabit is usually regarded as consisting of two divisions—Great Kabylia and Lesser Kabylia—the former being also known as the Kabylia of the Jurjura (also called Adrar Budfel, "Mountain of Snow"). It is admitted on all hands that the Berbers form the main aboriginal element in the population of northern Africa, that at one time or other they have occupied the whole tract of country from Egypt in the east to the Canary Islands in the west, and that they are still represented not only by the Tuáreg (Amashir, etc.), who retain their native speech, but by many tribes that have become altogether Arab in language. In regard to their real ethnic relations, however, there has been much discussion and theory: Kaltbrunner includes the Berbers in the Mediterranean race in which Haeckel places the Semites, Iberians, etc. M. G. Olivier[1] recognizes the Berbers as Aryans, and Faidherbe regards them as the indigenous Libyans mingled with a fair-skinned people of European origin; while Pruner Bey and Duveyrier maintain the close relation of the Berbers with the ancient Egyptians, and consider them as forming together the white African race.[2] Be this as it may, the Kabyles are a Berber stock, and more particularly correspond to that part of the race which was known to the Romans as Numidians. Physically they do not present any very prominent contrast to the Arabs of Algeria. Both Kabyle and Arab are white at birth, but rapidly grow brown through exposure to air and sunshine. Both have in general brown eyes and wavy hair of coarse quality, varying from dark brown to jet black. In stature there is perhaps a little difference in favor of the Kabyle, and he appears also to have a stouter trunk and bulkier muscles. Both are clearly dolichocephalic. Among the Kabyles, it is worthy of particular notice, there exists a varying proportion of individuals with fair skins, ruddy complexions, and blue or gray eyes. As to the ethnic origin of this peculiar element many conjectures have been hazarded,—one theorist seeing in them the vandals, another the Gallic mercenaries of Rome, another an aboriginal fair-skinned race, another the dolmen-building people from Europe. In the whole domain of life and character the contrasts between Arab and Kabyle are of the most radical and striking kind. The Kabyle lives in a house of stone or clay, forming part of a fixed village or hamlet; the Arab's tent is moved from place to place. The Kabyle enjoys the individual proprietorship of his garden and his orchards: with the Arab the ownership of the soil is an attribute of the tribe. While cereals alone are cultivated by the Arab, the Kabyle has his fig trees, olives, and vines, vegetables, and tobacco. Active, energetic, and enterprising, the Kabyle is to be found far from home—as a soldier in the French army, as a workman in the towns, as a field laborer, or as a peddler or trader earning by steady effort the means of purchasing his bit of ground in his native village. Nor, however insignificant they may appear when measured by a high European standard, are the native industries to be despised. Not only do they comprise the making of lime, tiles, woodwork for the houses, domestic utensils, and agricultural implements, but also the weaving and dyeing of several kinds of cloth, the tanning and dressing of leather, and the manufacture of oil and soap. Without the assistance of the wheel, the women turn out a variety of earthenware articles: before it became a sort of proscribed industry the production of gunpowder was regularly carried on; the native jewellers make excellent ornaments

[2] See Henri Duveyrier,[a] "Les Progrès de la géographie en Algérie, 1868–71," *Bull. de la Soc. Khédiviale de Géogr.*, Cairo, 1876.

[a] Born in 1840 in Paris, travelled with Barth, wrote *Exploration du Sahara*, prisoner in the Franco-Prussian war. He was son of Charles (1803–66) and nephew of A. H. Joseph (1785–1865), who were dramatic collaborators with Scribe.—AM. ED.

in silver, coral, and enamel; in some places wood carving has been brought to considerable perfection; and native artists know how to engrave on metal both by etching and the burin. Like the Arabs of Algeria, the Kabyles are Mahometans of the Sunnite branch and the Malekite rite, looking to Morocco as the nearer centre of their religion; but, whereas the Arabs are fatalistic and superstitious, the Kabyles show a more independent and rationalistic turn of mind. In spite of the Koran and its administrators the Kabyles are essentially democratic. In the words of Renan,[1] "the people is everything and suffices for everything; government, police, administration of justice, cost nothing to the community. It is the ideal of democracy, the direct government of the people by the people." The political unit is the village or commune; so many ...lages constitute a fraction, so many fractions a tri... and the tribes again are combined in the Kabaïla or confederation. The governing authority in the commune is the Jemá'a or general gathering of the citizens,—every man old enough to keep the fast of the Ramadhan having a right to take part in its proceedings. Its chief executive officer, the *amin*, is chosen by the goodwill of his fellows, receives no remuneration, and withdraws from his functions as soon as he loses the confidence of the electorate. Some of the Kabyles retain their vernacular speech, while others have more or less completely adopted Arabic. The best known dialect is that of the Igaouaouen, or Zouaoua,[2] who, at least from the time of Ibn Khaldoun, have been settled on the northern side of the Jurjura; it is the principal basis of Hanoteau's *Essai de Grammaire Kabyle* (Paris, 1858). Unlike their southern brethren, the Kabyles have no alphabet, and their literature is still in the stage of oral transmission for the most part by professional reciters. Hanoteau's *Poésies populaires de la Kabylie du Jurjura* (Paris, 1867) gives the text and translation of a considerable number of historical pieces, proverbial couplets and quatrains, dancing songs, etc.

The best résumé of ascertained facts in regard to the Kabyles is the *Instructions sur l'Anthropologie de l'Algérie*, by General Faidherbe and Dr. Paul Topinard, Paris, 1874. See also Daumas, *Le Sahara Algérien*, Paris, 1845; De Slane's translation of Ibn Khaldoun's *Hist. des Berbères*, Algiers, 1852; Aucapitaine, *Les Kabyles et la Colon. de l'Algérie*, Paris, 1864, and *Les Beni M'zab*, 1868; Hanoteau and Letourneaux, *La Kabylie et les Coutumes Kabyles*, Paris, 1873; a paper by Charmetant, the head of the Roman Catholic mission, in *Jahrbücher der Verbreitung des Glaubens*, 1874; Dugas, *La Kabylie et le peuple Kabyle*, Paris, 1878; Récoux, *La démographie de l'Algérie*, Paris, 1880.

KADOM, a town of Russia, in the Temnikoff district of the Tamboff government, 169 miles north-north-east from Tamboff, near the Moksha, a navigable sub-tributary of the Volga. It lies for the most part in a low sandy plain, but the principal church and the Sorova convent are situated on a hill. The public buildings are of no special note. The population was 7365 in 1861, and 8,100 in 1900. A considerable trade is fostered by the local fairs and markets.

Kadom is an ancient place; it was purchased in 1381 along with the Meshtcher lordship by Demetrius of the Don. In modern times it has had a curious administrative history: incorporated with the Kazan government in 1708, it was assigned to the Azoff government in 1719, to the Shatsk province of the Voronezh government in 1725, and to Tamboff in 1779.

KÁDÚR, or CADOOR, a district of Mysore state, southern India, lying between 13° 12′ and 13° 58′ N. lat., and between 75° 8′ and 76° 25′ E. long., with an area of 2294 square miles. It is bounded on the N. by Shimoga, on the E. by Chitaldrug, on the S. of Hassan,—all Mysore districts; on the W. the Western Ghâts separate it from the Bombay district of South Kánara.

[1] "La société berbère," *Revue des Deux Mondes*, 1873.
[2] The Arabic Zouaoua (to use the French transliteration) has given rise to the well-known "Zouaves" of the French army.

The larger portion of the district consists of the Malnád or hill country, which contains some of the wildest mountain scenery in southern India. The western frontier is formed by the chain of the Ghâts, of which the highest peaks are the Kuduremukh (6215 feet) and the Meruti Gudda (5451 feet). The centre of the district is occupied by the horseshoe range of the Bába Budans, containing the loftiest mountain in Mysore, Mulaingiri, 6317 feet. The Maidán or plain country lying beneath the amphitheatre formed by the Bába Budan hills is the most fertile portion of the district, well watered, and with the famous "black cotton soil." The principal rivers are the Tunga and Bhadra, which rise near each other in the Ghâts, and unite to form the Tungabhadra, ...ibutary of the Kistna. The eastern portion of the district is watered by the Vedavati. At the point where this river leaves the Bába Budan hills, it is embanked to form two extensive tanks, which irrigate the lower valley. From all the rivers water is drawn off into irrigation channels by means of anicuts or weirs. The chief natural wealth of Kádúr is in its forests, which contain inexhaustible supplies of the finest timber, especially teak, and also furnish shelter for the coffee plantations. Iron is found and smelted at the foot of the hills, and corundum exists in certain localities. Wild beasts and game are numerous, and fish are abundant.

The census of 1871 returned the population of the district at 332,381 (Hindus, 318,480; Mahometans, 12,017; Jains, 1316; Christians, 568). Only one town, Tarikere, contains over 5000 inhabitants, the population in 1871 being 5302. Chikmágalúr, the headquarters of the district, has only 2027 inhabitants, and Kádúr, the old civil station, only 2733. The staple crop of the district is rice, chiefly grown on the hill slopes, where the natural rainfall is sufficient, or in the river valleys, where the fields can be irrigated from tanks and artificial canals. The principal unirrigated crop is *rági* (*Cynosurus coracanus*), which is preferred as food by the natives to rice, as affording more sustenance. The principal agricultural industry, however, is coffee cultivation. The berry is stated to have been first introduced by a Mahometan saint, Bába Budan, about two centuries ago, on his return from a pilgrimage to Mecca. European capital was not attracted to the enterprise till about 1840, but there are now 60,000 acres under coffee. The cocoa-nut and areca-nut palms flourish in the moist and sheltered valleys in the west. A Government cinchona plantation has also been established on the Bába Budan hills. The local manufactures include the production of cotton cloth, rough blankets, and sugar, as well as oil-pressing, spirit-distilling, and iron-smelting. The annual value of the district exports is estimated at £297,000, and the imports at £217,000. The revenue of the district in 1873–74, excluding forests, education, and public works, was £94,316. Government aided and inspected schools numbered 176 in 1874, attended by 3027 pupils; unaided schools, 121, with 1235 pupils. The mean annual temperature at Chikmágalúr, is about 78° F. During 1873 and 1874 the maximum recorded was 93°, and the lowest 69°. In the Malnád the temperature falls much lower, and the cold at night in December and January is very sharp. The average rainfall at Chikmágalúr during the four years ending 1874 was only 36 inches; while on certain coffee plantations on the Malnád from 100 to 170 inches have been registered. Jungle or malarious fevers are prevalent in the Malnád at certain seasons of the year, from which neither natives nor Europeans are exempt.

History.—As containing the hallowed sources of the Tungabhadra, Kádúr district abounds with scenes associated with the legends of the *Rámáyana*. Sringeri or Rishyasringa-giri, on the Tunga river, takes precedence of all other places in its claims to mythical antiquity. Here, in historical times, was the home of Sankara Acharya, the great Sivaite reformer of the 8th century; and here at the present day resides the *jagat-guru* or supreme high priest of the Smarta Bráhmans. The most ancient sites connected with local history are the ruins of Ratnápuri and of Sak-ráypatná, both of which are described as the capitals of powerful kings before the rise of the Ballála dynasty. On the overthrow of the Ballálas by the Mahometans, the Vijayanagar empire established itself over southern India; but the feudatory chiefs were practically independent. Subsequently the greater part of the district was overrun by the Ikkeri or Bednur *pálegár* from the neighboring district of Hassan, who was in his turn defeated in 1694 by the conquering Hindu rájás of Mysore. It was not until 1763 that

Hyder Ali finally incorporated the whole country in the Mysore dominions. In 1799, after the death of Tipú, Kádúr was restored to the Hindu kingdom then set up by the marquis of Wellesley. But in 1831 a general insurrection broke out, which overpowered the Mysore Government, and necessitated the use of British troops before it was suppressed. The inquiry that followed led to the assumption of the direct administration of the entire state of Mysore by the British. This administration was continued till March, 1881, when the state was again handed over to its native rulers, on the representative of the ruling family attaining his majority.

KAEMPFER, ENGELBRECHT (1651–1716), traveller and physician, was born September 16, 1651, at Lemgo in Lippe-Detmold, Westphalia, where his father was a pastor. He studied at Hameln, Lüneburg, Hamburg, and Lübeck, and, after graduating as doctor of philosophy at Cracow, he spent four years at Königsberg in Prussia, in the study of medicine and the natural sciences. In 1681 he visited Upsala in Sweden, where he was offered inducements to settle; but his desire for foreign travel led him eagerly to accept the post of secretary to the embassy which Charles XI. sent through Russia to Persia in 1683. When after a stay of two years the Swedish embassy prepared to return from Ispahan, Kaempfer entered the service of the Dutch East India Company, as chief surgeon of the fleet then in the Persian Gulf. A malignant fever which seized him at Gamron on the Gulf prevented his further travels for a long while; and he did not arrive at Batavia till September, 1689. The following winter was spent by Kaempfer in studying the natural history of Java; and in May, 1690, he set out for Japan as physician to the embassy sent yearly to that country by the Dutch. The ship in which he sailed touched at Siam, and in September arrived at Nagasaki, the only Japanese port then open to foreigners. Kaempfer stayed two years in Japan, during which he twice visited Yedo (now Tôkiô), the capital of the shôgun. His adroitness, insinuating manners, and medical skill overcame the habitual jealousy and reticence of the natives, and enabled him to elicit much valuable information, which he has embodied in his *History of Japan*. In November, 1692, Kaempfer left Japan, and in October, 1693, he landed at Amsterdam. Receiving the degree of doctor of medicine at Leyden, he settled down in his native city to edit and publish his travels and scientific papers at his leisure; but his appointment as physician to the count of Lippe involved him in the cares of an extensive medical practice that hindered his literary labors. His health, already impaired by his travels, gave way under various domestic troubles; and he died at Lemgo, November 2, 1716, in his sixty-sixth year.

The only work Kaempfer lived to publish was *Amœnitatum Exoticarum Politico-physico-medicarum Fasciculi V.* (Lemgo, 1712), a selection from his papers giving most interesting results of his observations in Georgia, Persia, and Japan. At his death his unpublished manuscripts were purchased by Sir Hans Sloane, and conveyed to England. Among them was a *History of Japan*, which was translated from the manuscript into English by J. G. Scheuchzer and published at London, in 2 vols., in 1728. The original German has never been published, the extant German version being taken from the English. The interest and value of the work are very great. It not only contains a history, strictly so called, but also a description of the political, social, and physical state of the country in the 17th century. For upwards of a hundred years it remained the chief, if not almost the only available source of information about Japan for the general reader, and is still not wholly obsolete. A life of the author is prefixed to the *History*.

KAFFA, a town in the Crimea. See THEODOSIA.

KAFFA, or GOMARA, a little-known region to the south of Abyssinia in Africa, forming a cool elevated tract between the basins of the Sobat on the west and the Juba on the east. Some of its mountain summits, among which is Mount Mata Gera, are believed to be over 12,000 feet high. Kaffa is held to be the native home of the coffee-plant, which grows in wild profusion on the mountain slopes. The chief town is Bonga, described as one of the largest towns in Ethiopia, in 7° 12′ N. lat. The inhabitants, largely belonging to the race of black Gallas, are said by Beke to be Christians, and to speak a language cognate with the Gonga tongue, spoken in a portion of Damot on the northern side of the Abái. The French traveller Abbadie, who visited Kaffa in 1843, was the first European explorer. Dr. Beke gives a description of the habits of the people in the *London Geographical Journal* for 1843; as also does Dr. Krapf in his *Travels, etc., in Eastern Africa* (1860).

KAFFRARIA, KAFFRES. The name Kaffraria or Kaffreland properly means the country of the Kaffres, and in this sense would embrace the whole region extending from the river Keiskamma to Delagoa Bay, including at least British Kaffraria and Kaffraria Proper, Natal, Zululand, the Transvaal, and the Orange River Free State. The term, however, has usually been confined to the districts popularly known as British Kaffraria and Kaffraria Proper. Neither term is now used officially. British Kaffraria was incorporated with Cape Colony in 1866, and now forms the two official districts of King William's Town and East London; Kaffraria Proper is now known officially as the Transkeian Territories, or simply the Transkei. But, as the two designations are still in popular use, and as they are in several respects convenient, it will be useful here to give some account of the geography and the more important events in the history of the two districts under the general heading.

The physical characteristics of the two Kaffrarias bear a general resemblance to those of the Cape Colony, of which they are the northeast continuation. The country generally rises from the sea-level in a series of terraces to the lofty mountains forming the northwest boundary. British Kaffraria culminates in the Amatola mountains, rising in one part to upwards of 6000 feet. The features of Kaffraria Proper are much more varied, and exhibit some of the most picturesque scenery in South Africa. The rugged range of the Drakenberg forms its northwest boundary, rising at its north-eastern point to a height of 9657 feet. Between that range and the coast-lands are many subsidiary ranges with fertile valleys through which the great rivers make their way to the Indian Ocean. The coast region is more broken than is the case farther south. The prevalent rock along the coast of Kaffraria is the Old Sandstone, non-fossiliferous rock, quartzite, intersected occasionally with veins of white quartz rock, and often capped with a dense mass of conglomerate; while the interior mountains are classed by Mr. Dunn as the Stormberg coal-bearing fossiliferous beds of the Triassic period. Kaffraria is watered by hundreds of rivers, most of them rising at no great distance from the coast, but several of them of large dimensions. The chief, beginning at the south, are the Keiskamma, the Buffalo, the Kei, the Bashee, the Umtata, the St. John's or Umzimvubu, with several large tributaries, and the Umtamvuna, which separates British Kaffraria from Natal. The rivers are of little use for navigation.

Kaffraria forms one of the most naturally fertile regions in S. Africa. In British Kaffraria most of the cereals grow, and in the cloofs, and scattered over the country, are forests and clumps of valuable timber. The Transkei shows even greater possibilities of culture. The mountain gorges abound in fine trees; thick forest and bush cover the banks of the rivers; grass grows luxuriantly in the lower regions; and the lowlands and valleys are favorable to almost any kind of fruit, field, and garden cultivation. In the occupied district cattle and sheep are numerous; lions are still found in the interior, and a fair amount of the game characteristic of the inland districts belonging to the Cape. The climate generally resembles that of the eastern province of Cape Colony, but with features more approaching to those of the tropics. The coast districts are extremely hot in summer, the temperature

on an average varying from 70° to 90°, while in winter the day temperature is seldom below 50°, though the nights are very cold. But the variation in altitude places climates of all grades within easy reach, from the burning coast to the snow-clad mountain. Thunderstorms are frequent in summer; rain mostly falls in spring and summer, and the winters are generally dry. On the whole the climate may be considered as extremely healthy.

British Kaffraria, on its incorporation with Cape Colony, was divided into King William's Town and East London, each with a capital of the same name, and forming the two most easterly divisions of the colony. King William's Town has an area of 1781 square miles, and a total population (1875) of 106,640, of whom 9012 are white; the population of the capital is 5169. The area of East London province is 1225 square miles, and the population 15,514, of whom 3773 are white. Its capital, East London (population, with the contiguous Panmure, 2134), at the mouth of the Buffalo river, is the port for British Kaffraria. The anchorage is exposed, but extensive harbor works are in operation (1881). In 1880, 135 foreign ships arrived of 134,753 tons, and coastwise 152 of 217,174 tons. It is connected by railway with King William's Town, the line going northwest as far as Queenstown, the capital of the province of that name. The imports of East London amounted in 1880 to £1,152,610, showing an increase of £72,488 over the previous year; and the exports to £303,991, being an increase over 1879 of £38,369. Sheep and goat rearing is extensively carried on; there are also large numbers of cattle. Wheat, maize, and millet are the staple agricultural products. The wool exported from East London in 1880 amounted to 5,253,650 lb. In both divisions are numerous German settlements.

Kaffraria Proper or the Transkeian Territories consist of the territories of various native tribes, most of which have been annexed (1875–80) to the Cape Colony, and are under the jurisdiction of magistrates. The area of Kaffraria proper is about 18,000 square miles,—its extreme length being about 230 miles, and its breadth from the sea to the mountains bounding it on the north-west averaging about 120 miles. On the south-east it is washed by the Indian Ocean; the Drakenberg and Stormberg ranges bound it on the north-west; in the west and south-west are the Indwe and Kei rivers, and on the east and north-east the Umzimkulu and Umtamvuna. It is surrounded by Cape Colony, Basutoland, and Natal. The area and population of the various districts can only be given approximately; the following is an official estimate of the present population:—

Fingoland, ...	45,000	Tambookieland, .	70,000
Idutwya Reserve, .	18,000	Griqualand East, .	100,000
Gcalekaland (Kreli's country),	60,000	Pondoland, . . .	230,000
Bomvaniland, . .	20,000		543,000

Fingoland, to which (with the Idutwya Reserve and Gcalekaland) the name Tanskeian Territory, or the Transkei, is often confined, is about 40 miles square, and is the most advanced of the districts; it is suited both for pasture and for cultivation. According to the latest return it had 4976 horses, 37,298 calves, 182,869 sheep, and 50,240 goats, the total value of its stock being £321,784. The revenue in 1879 was £5047, the expenditure £3286. There are many trading stations, and wool is largely exported. The annual value of the imports and exports is estimated at £150,000. Tambookieland or Tembuland is divided into Tambookicland Proper, the district of the Emigrant Tambookies, and Bomvaniland. The first is about 75 miles long and from 30 to 40 broad. The population is probably about 30,000. There are many trading stations, and large numbers of sheep and cattle. A bill for the annexation of Tambookieland Proper passed the Cape Parliament in 1880. The revenue of the whole of Tambookieland was estimated at £12,500 for 1880. The magistracy is at Umtata on the river of that name. West of Tambookieland and Fingoland is the district of the Emigrant Tambookies, removed some years ago from Tambookieland over the Indwe. It is 85 miles long and 20 broad; population about 40,000, with (in 1875) 5348 horses, 38,749 cattle, 84,201 sheep, 47,300 goats, and many trading stations. The Idutwya Reserve is about 28 miles square, with (in 1874) 2514 horses, 17,698 cattle, 51,302 sheep, 14,909 goats; revenue about £1380, expenditure £2976. Gcalekaland, the country of the Gcalekas, or Ama-Xosa Kaffres under Kreli, is about 50 miles long and 30 broad. Traders are settling in the country, and a small trade in wool is done. All these territories lie mainly between the Kei and Bashee rivers. Bomvaniland is about 30 miles by 20; it lies between the Bashee and Umtata rivers. On both sides of St. John's river, and extending to the Natal boundary, is Pondoland; only that portion of it on the south side of the St. John's river, known as St. John's Territories (21,905 inhabitants), has been formally annexed, but the magistrate has jurisdiction on both sides. Pondoland is about 60 miles square. This district is noted for its fertility and beauty, and has much excellent pasture land. The district between Pondoland, Natal, Basutoland, Wodehouse division, and Tambookieland, is now known as Griqualand East, inhabited by various tribes (upwards of 100,000 souls), about 125 miles long and 40 to 75 miles wide. A great part of this territory formerly went by the name of Nomansland, in area about 6000 square miles, and lay at the foot of the Drakenberg, between the Umzimkulu and Kinira rivers. In 1862 it was handed over to Adam Kok's people, but in 1877 an Act of annexation was passed, which was promulgated in 1879. The boundaries of the new district were made to include what was known as the St. John's river territory, including, however, British Pondoland. The Griquas themselves are not numerous, being found chiefly in the neighborhood of Kokstadt, the station of the chief magistrate, 95 miles from the mouth of the St. John's River. Their farms are rapidly passing into the hands of Europeans. Various other tribes have had land allotted them in the district. The whole district is said to be very fertile, and eminently adapted for the cultivation of various kinds of grain. In 1880 land was granted and sold in Griqualand East to the extent of about 300,000 acres. All these districts may be regarded as virtually annexed to the Cape, with which they will doubtless be gradually incorporated. Kaffraria is governed by ministers responsible to the Cape legislature, in which, however, it has no representatives. Mission stations and trading stations are scattered all over the region.

Kaffre Wars.—During the extension of the Dutch and English powers over South Africa, collisions with the natives were of course inevitable; there are six contests which more especially came under the designation of Kaffre wars. In 1780 the Great Fish river was settled on as the boundary between the Kaffres and the colonists. For some time previous to 1811 the Kaffres in the Zuurveld broke the boundary, took possession of the neutral ground, and committed depredations on the colonists. In order to expel them from the Zuurveld, Colonel Graham took the field with a mixed force in December, 1811, and in the end the Kaffres were driven beyond the Fish river. In 1817 Lord Charles Somerset, governor of the colony, entered into a treaty with a chief, Ngqika, in which he acknowledged that chief as head of all the Ama-Xosa Kaffres, and in which it was agreed that any kraal to which stolen cattle could be traced should be held accountable for compensation. This was a serious blunder, Ngqika being merely a subordinate chief, the paramount chief of the Ama-Xosas being Hintza, the chief of the Ama-Gcalekas. Some stolen cattle having been traced to one of the kraals of a chief Ndlambe, Major Fraser, with a small force, was sent to enforce restitution. On this, Ndlambe and his fellow-chiefs attacked Ngqika, who claimed and obtained help from the colonial Government. The Kaffres were completely routed in 1818 by a force under Lieutenant-Colonel Brereton. They rallied, however, and a great force suddenly poured into the colony in the early part of 1819, sweeping at first every-

thing before them. On April 22, the prophet-chief, Makanna, attacked Grahamstown, which was garrisoned by a mere handful of troops, under Colonel Wiltshire. Assistance arrived, however, and the Kaffres were defeated with great slaughter. The principal chiefs were outlawed, the country between Koonap Kat and the Great Fish river was added to the colony, and that between the latter river and the Keiskamma declared to be neutral territory; on this some of the Kaffres were allowed to settle. Final peace, however, was far from being secured. One tribe or another was almost constantly on the move, causing disturbances in which the colonists could not but suffer. In 1828 the chief Ngqika or Gaika died, and during the minority of his infant son Sandili, the government of the tribe, now called Gaikas, devolved on Macomo, his elder half-brother, who had been permitted to occupy the valleys of the Kat river. On account of an attack on the Ama-Tembu Kaffres, he was removed from the settlement, as was also his brother Tyali (1833). Permitted to return, they were removed again, and this vacillating treatmont had no doubt something to do with the next war. On December 11, 1834, another brother of Macomo, a chief of high rank, was killed while resisting a commando party. This set the whole of the Kaffre tribes in a blaze. Under Macomo, Tyali, and Xexo a force of 10,000 fighting men swept across the frontier, spread over the country, pillaged and burned the homesteads, and murdered the farmers and all who dared to resist. The fighting power of the colony was at the time scanty, but all available forces were mustered, under Colonel (afterwards Sir Harry) Smith, who reached Grahamstown on January 6, 1835, six days after news of the rising reached Cape Town. The enemy's territory was invaded, and after nine months' fighting the Kaffres were completely subdued, and a new treaty of peace concluded (September 17). By this treaty all the country as far as the river Kei was acknowledged to be British, and its inhabitants declared British subjects. A site for the seat of government was selected, and named King William's Town. All this, however, was undone by the home Government, the secretary of state for the colonies at the time being Lord Glenelg. A policy of conciliation and mildness towards the Kaffres was adopted, a policy distasteful to the colonists, although laudable efforts seem to have been made to carry it out. The next war, known as the "War of the Axe," arose from the murder of a Hottentot, to whom an old Kaffre thief was manacled while being conveyed to Grahamstown for trial for stealing an axe. The escort was attacked by a party of Kaffres and the Hottentot killed. The surrender of the murderer was refused, and war was declared on March 11, 1846. The Gaikas were the chief tribe engaged in the war, assisted during the course of it by the Tambookies. After some reverses the Kaffres were signally defeated on June 7, by General Somerset on the Gwangu, a few miles from Fort Peddie. Still the war went on, till at length Sandili, the chief of the Gaikas, surrendered, as also gradually did the other chiefs; and by the beginning of 1848 the Kaffres were again subdued, after twenty-one months' fighting. The country was declared under British rule, and was formed into the division of Victoria East and British Kaffraria, between the new colonial boundary and the Kei river,—the latter reserved for occupation by the Kaffres. The peace, however, was not to last long. About October, 1850, it was reported that the Kaffres were preparing for war. Sir Harry Smith proceeded to the frontier, and summoned Sandili and the other chiefs to an interview. Sandili refused obedience; upon which, at an assembly of other chiefs, the governor declared him deposed from his chiefship, and appointed an Englishman, Mr. Brownlee, a magistrate, to be chief of the Gaika tribe. This measure is said to have been the immediate cause of the ensuing outbreak; but there is no doubt that the Kaffres had already determined on war. On the 24th of December, Colonel Mackinnon, being sent with a small force to capture Sandili, was attacked in a narrow defile by a large body of Kaffres, and compelled to retreat with some loss. This was the signal for a general rising of the Gaika tribe. The settlers in the military villages, assembled in fancied security to celebrate Christmas day, were surprised by the treacherous foe, many of them murdered, and their houses given to the flames. Other disasters followed in quick succession. A small patrol of military was cut off to a man. The greater part of the Kaffre police deserted, many of them carrying off their arms and accoutrements. Flushed with success, the Kaffres in immense force surrounded and attacked Fort Cox, where the governor was with an inconsiderable force. His situation was truly critical. More than one unsuccessful attempt was made to relieve him; but his dauntless spirit was equal to the occasion At the head of one hundred and fifty mounted riflemen, accompanied by Colonel Mackinnon, he dashed out of the fort, and, through a heavy fire of the enemy, rode to King William's Town,—a distance of 12 miles. Meantime, a new enemy appeared. A large number of the Kat river Hottentots, who had in former wars been firm allies of the British, rose in rebellion. This revolt was followed by that of the Hottentots at other missionary stations; and part of the Hottentots of the Cape Mounted Rifles followed their example We have only space to state the general results of the war. After the confusion caused by the sudden outbreak had subsided, and due preparations were made, Sir Harry Smith and his gallant force soon turned the tide of war against the Kaffres. The Amatola mountains were stormed; and the paramount chief Kreli who all along covertly assisted the Gaikas, was severely punished. In April, 1852, Sir Harry Smith was recalled, and was succeeded by Lieutenant-General Cathcart. Kreli was again attacked, and reduced to submission. The Amatolas were finally cleared of Kaffres, and small forts erected among them to prevent their reoccupation. It was not till March 23, 1853, that martial law was revoked, and the most sanguinary of Kaffre wars brought to a conclusion, with a loss of many hundred British soldiers. Shortly after, British Kaffraria was erected into a crown colony, which it remained till 1865, when it was incorporated with the Cape Colony. After a peace of twenty-five years, once more, in 1877, the Kaffres (of Kaffraria Proper) interrupted the progress of the country and caused considerable destruction and distress. In September of that year the hereditary enmity between the Fingoes and Gcalekas broke out into open hostility, the Government taking the part of the former, who were under its protection. At first the Gcalekas were driven beyond the Bashee; but collecting in force again they recrossed, and got the Gaikas to join them about the end of December. After several months the governor called in the aid of the imperial troops, and soon effectually broke up and defeated the rebels. The war with the Zulu Kaffres will be described under ZULULAND.

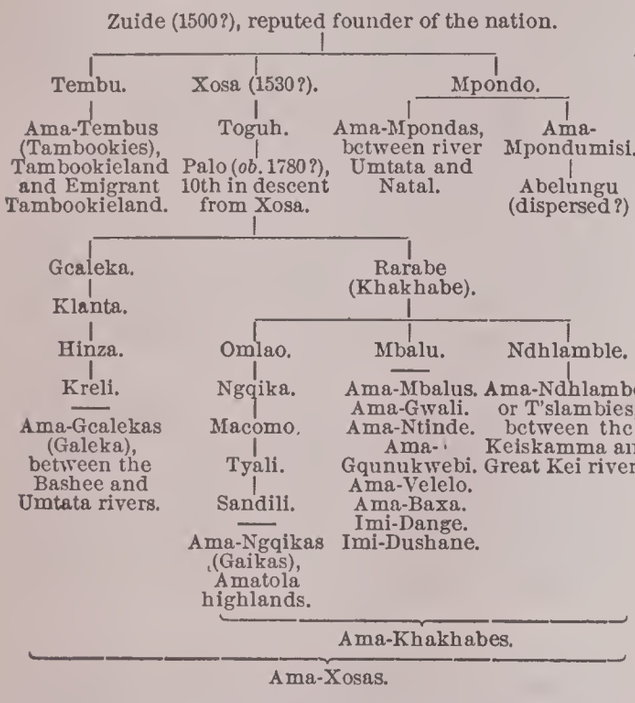
The Kaffres.

The Kaffres, or Kafirs, a large South African race, form ethnically a well-marked variety of the Negro type, and linguistically a distinct branch of the Bantu family. There are no general or collective national names, and the various tribal divisions are mostly designated by those of distinguished historical or legendary chiefs, founders of dynasties or hereditary chieftaincies. The name Káfir (a form which in popular usage designates the African race less frequently than the inhabitants of Kafiristan in Persia) is that applied by Mahometans to all who reject the faith of Islám. It was thus current along the east coast of Africa at the arrival of the Portuguese, and passed from them to the Dutch and English, and recently even to the natives themselves under the form *Kafula*, as in the expression *ba-ng'ama Kafula-nje*, they are only Káfirs. Of this race there are two main divisions, jointly occupying the south-east corner of the continent from the Lower Limpopo to the Great Fish river north and south, and from the escarpments of the central plateau to the Indian Ocean west and east. They thus impinge southwards on the Hottentot domain, westwards on the kindred Basuto and Bechuana nations, northwards on the Tekezas, Makuas, and others also of kindred stock occupying the region stretching from the Limpopo to the Zambesi and even beyond it to Lakes Nyassa and Tanganyika. Politically the Kaffre domain comprises the Portuguese possessions skirting Delagoa Bay, the semi-independent Zulu territory, the colony of Natal, and the ancient territory of Zanguana, which included that part of Cape Colony till recently known as British and Independent Kaffraria. Of the two branches, each split up into a multiplicity of tribal divisions, the representative nations are the Ama-Zulus in the north, and the Ama-Xosas, Ama-Tembu, and Ama-Mpondas or Kaffres Proper in the south, whence the compound term Zulu-Kaffre now commonly applied in a collective sense to the whole race. Intermediate between the two were the Ama-Lala or Balala of Natal, where they are still represented by the Ama-Ncolosi, and several broken Ama-Zulu tribes now collectively known to the Kaffres as Ama-Fengu, *i.e.*,

"poor" or "needy" people, from *fenguza*, to seek service.[1]

The numerous and politically important ramifications of the Kaffres Proper cannot be understood without reference to the national genealogies, most of the tribal names, as already stated, being those of real or reputed founders of dynasties. Thus the term Ama-Xosa itself means simply the "people of Xosa," a somewhat mythical chief supposed to have flourished about the year 1530. Ninth in descent from his son Toguh was Palo, who died about 1780, leaving two sons, Gcalcka and Rarabe (pronounced Kha-Kha-bē), from whom came the Ama-Gcalekas, Ama-Dhlambe (T'slambies), and the Ama-Ngquikas (Gaikas or Sandili's people). The Ama-Mpondas do not descend from Xosa, but probably from an elder brother, while the Ama-Tembus (Tambookies), though apparently representing a younger branch, are regarded by all the Kaffre tribes as the royal race. Hence the Gcaleka chief, who is lord paramount of all the Ama-Xosa tribes, always takes his first or "great wife" from the Ama-Tembu royal family, and her issue alone have any claim to the succession. The subjoined genealogical tree will help to place the mutual relations of all the Kaffre tribes in a clearer light:—



Here it will be seen that, as representing the elder branch, the Gcalekas stand quite apart from the rest of Xosa's descendants, whom they group collectively as Ama-Rarabe (Ama-Khakhabe), and whose genealogies, except in the case of the Gaikas and T'slambies, are very confused and uncertain. The Ama-Xosa country lies mainly between the Keiskamma and Umtata rivers.

The Ama-Zulus, so named by their Basuto neighbors, call themselves Abantu ba-Kwa-Zulu, *i.e.*, "people of Zulu's land," or briefly Bakwa-Zulu, from a legendary chief Zulu, founder of the royal dynasty. They were originally an obscure tribe between the Bumbo and Omtukela mountains, but rose suddenly to formidable power under[2] Chaka, who had been brought up among the neighboring and powerful Umtetwas, and who succeeded the chiefs of that tribe and of his own in the beginning of the present century. But the true mother tribes seem to have been the extinct Ama-Ntombela, whence the Ama-Tefulu, the U'ndwande, U'mlelas, U'mtetwas, and many others, all absorbed or claiming to be true Zulus. But they are only so by political subjection, and the gradual adoption of the Zulu dress, usages, and speech. Hence in most cases the term Zulu implies political rather than blood relationship. This remark applies also to the followers of Umzelekatze, who, after a fierce struggle with the Bechuanas, founded in 1830 a second Zulu state about the head waters of the Orange river. In 1837 most of them were driven northward by the Boers, and have become dispersed amongst the Makuas and Matebele tribes.

The origin of the Zulu-Kaffre race has given rise to much controversy. It is obvious that they are not the aborigines of their present domain, whence in comparatively recent times they have displaced the Hottentots and Bosjesmans of fundamentally distinct stock. On the other hand they are closely allied in speech and physique to the surrounding Basutos, Bechuanas, Matebeles and other members of the great South African Negroid family. Hence no far-fetched theories are needed to account for their appearance in the southeast corner of the continent, where their presence is sufficiently explained by the gradual onward movement of the populations pressing southward on the Hottentot and Bosjesman domain. The specific differences in speech and appearance by which they are distinguished from the other branches of the family must in the same way be explained by the altered climatic and other outward conditions of their new habitat. Hence it is that the further they have penetrated southward the further have they become differentiated from the pure Negro type, from which attempts have even been made to separate them altogether.[3] Thus the light and clear brown complexion prevalent amongst the southern Ama-Tembus becomes gradually darker as we proceed northward, passing at last to the blue-black and sepia of the Ama-Swazis and Tekezas. Even many of the mixed Fengu tribes are of a polished ebony color, like that of the Joloffs and other pure Senegambian Negroes. The hair is uniformly of a woolly texture, not differing perceptibly from that of the ordinary native of Sudan, nor growing in separate tufts on the scalp, as is often erroneously asserted. This phenomenon of a tufted growth of hair, on which many anthropologists have based their classifications of the dark races, has absolutely no existence in nature. The Kaffre head also is dolichocephalic (index 72.54, as compared with the West African 73.40); but it is also high or long vertically (index 195.8, as compared with Negro 149.5),[4] and it is in this feature of hypsistenocephaly (height and length combined) that the Kaffre presents the most striking contrast with the pure Negro. But, the nose being generally rather broad[5] and the lips thick, the Kaffre face, though somewhat oval, is never regular in the European sense, the deviations being normally in the direction of the Negro, with which race the peculiar odor of the skin again connects the Kaffres. In stature they rank next to the Patagonians, Polynesians, and West Africans, averaging from 5 ft. 9 in. to 5 ft. 11 in., and even 6 feet.[6] They are also slim, well-proportioned, and muscular; but Fritsch's measurements have shown that they are far from attaining the standard of almost ideal beauty with which early observers credited them. Owing to the hard life to which they are doomed, the women are generally inferior in appearance to the men, except amongst the Zulus, and especially the Tembus. Hence in the matrimonial market, while the Ama-Xosa girl realizes no more than ten or twelve head of cattle, the Ama-Tembu belle fetches as many as forty, and if specially fine even eighty.

The symmetrical and manly figures of the more warlike tribes are usually arrayed in leopard or ox-skins, of late years often replaced by European blankets, with feather head-dresses, coral and metal ornaments, bead armlets, and necklaces. The Makuas and a few others practise tatooing, and the Ama-Xosas are fond of painting or smearing their

[1] The Ama-Fengus are regarded both by the Ama-Zulus and Ama-Xosas as slaves or outcasts without any right to the freedom and privileges of true-born Kaffres. They are met with everywhere, not only in Fingoland between the Great Kei and Bashee rivers south of the Ama-Xosa territory, but also in Natal, Zululand, and north of it, as well as in the highlands of the interior. Yet they can scarcely be said to have any recognized territory of their own, and but for the intervention of the British they would have long ago been everywhere reduced to a state of serfdom by the dominant tribes. Those who were driven out of Zululand early in the present century fell into the hands of the Gcalekas, from whom they were delivered in 1835 by Sir Benjamin D'Urban, and by him removed to the Fort Peddie district between the Fish and Keiskamma rivers. Any tribes which become broken and mixed would probably be regarded as Ama-Fengus by the other Kaffres. Hence the multiplicity of clans, such as the Ama-Bele, Aba-Sembotweni, Ama-Zizi, Ama-Kuze, Aba-Sekunene, Ama-Ntokaze, Ama-Tetyeni, Aba-Shwawa, etc., all of whom are compared with that of the Laconian Helots, or the low-caste tribes of India.

[2] Seventh in descent from Zulu, through Kumede, Makeba, Punga, Ndaba, Yama, and Tezengakona (Bleek, *Zulu Legends*.)

[3] Amongst others quite recently by Girard de Rialle, who, in *Les Peuples de l'Afrique et de l'Amérique*, detaches the Kaffres from the Negroes, and treats them as an independent division of the African races. These he groups in five divisions:—(1) Bosjesmans, (2) Hottentots, (3) Negroes, (4) Kaffres, (5) Nubians and Fallahs,—a classification which even on linguistic grounds is untenable. J. Meyer also, notwithstanding their woolly hair, thick lips, high cheek bones, and dark complexion, maintains that their features are essentially "Asiatic."

[4] Topinard, *Anthropology*, p. 274.

[5] This feature varies considerably, "in the T'slambie tribes being broader and more of the Negro shape than in the Gaikas or Gcalekas, while among the Ama-Tembu and Ama-Mpondo it assumes more of the European character. In many of them the perfect Grecian and Roman noses are discernible" (Fleming's *Kaffraria*, p. 92).

[6] Gustav Fritsch, a most accurate observer, gives the mean of the Ama-Xosas as 1.718 metres, less than that of the Guinea Negro (1.724), but more than the English (1.708) and Scotch (1.710).

bodies with red ochre. Their arms consist chiefly of ox-hide shields 4 to 6 feet long, the kerri or club, and the assegai, of which there are two kinds, one long with 9-inch narrow blade, for throwing, the other short with broad blade 12 to 18 inches long, for stabbing. The dwellings, like those of the Hottentots, are simple conical huts grouped in kraals or villages, mostly of a temporary character. For all the Kaffres are still semi-nomadic, and easily break up their homes in search of fresh pastures. But, although cattle form their chief wealth, and hunting and stock-breeding their main pursuits, many have in recent times turned to husbandry. The Zulus raise regular crops of "mealies" (maize), and the Ama-Mpondas cultivate a species of millet, tobacco, water melons, yams, and other vegetables. Milk, millet, and maize form the staples of food, and meat is seldom eaten except in time of war Amongst some tribes the order to kill and eat their cattle is in fact equivalent to an order to prepare for some warlike undertaking.

Mentally and morally the Kaffres are on the whole superior to the average Negro. In all their social and political relations they display great tact and intelligence; they are remarkably brave, warlike, and hospitable, and were naturally honest and truthful until through contact with the whites they become suspicious, revengeful, and thievish, besides acquiring most European vices. Of religion as ordinarily understood they have very little, and have certainly never developed any mythologies or dogmatic systems. It is more than doubtful whether they had originally formed any notion of a Supreme Being; and such is the realistic bent of their minds that all such abstract conceptions, when interpreted to them by the missionaries, are immediately reduced to the grossest materialism. At the same time a belief in a future state is implied by a faintly developed worship of ancestry, accompanied by a few superstitious rites. There are no idols, sacrifices, or priests, but the prevalent belief in witchcraft has naturally led to the evolution of the "witch-doctor" or medicine-man, who often becomes an instrument of cruel oppression and injustice in the hands of unscrupulous chiefs. Circumcision and polygamy are universal; the former is sometimes attributed to Mahometan influences, but has really prevailed almost everywhere in East Africa from the remotest time.

Of the few industries the chief are copper and iron smelting practised by the Ama-Tembus, Zulus, and Swazis, who manufacture from the metal weapons, spoons, and agricultural implements, both for their own use and for trade. The Swazis display some taste in wood-carving, and others prepare a peculiar water-tight vessel of grass, somewhat like the wickerwork vases of the Siberian Yakuts. Characteristic of this race is their total ignorance or neglect of the art of navigation. Not the smallest boats are ever made for crossing the rivers, much less for venturing on the sea, except by the Makazana of Delagoa Bay and by the Zambesi people, who have canoes and flat-bottomed boats made of planks.

The Kaffre race has developed a distinct and apparently very old political system, which may be described as a patriarchal monarchy limited by a powerful aristocracy. Although the tribal state still prevails, the organization has thus acquired almost a feudal character. The nation is grouped in tribes, each under an hereditary *inkose* or chief, who administers his territory by means of officers chosen by himself, and who is supreme legislator with absolute jurisdiction and power of life and death. If his decisions are unjust, the nobles (that is, the foremost members of the tribe) protest in council, and their decisions form the traditional code of common law. A group of clans forms a nation, recognizing a common hereditary chief with the title of *umkumkani* or *inkose enkulu*, that is, "great chief," whose influence largely depends on his power and personal qualities. He possesses in theory unlimited authority, but in practice each clan retains a large share of self-government, the lord paramount seldom interfering except when appealed to. In Zululand this system rapidly developed under Chaka and his successors into a military despotism of an extremely arbitrary type. But with the fall of Cetewayo, followed by the division of the land amongst a number of semi-independent chiefs, an end was put to that absolute monarchy. While it lasted it was a distinct violation of the ancient liberties of the Zulu nation by the "great chief," who arrogated to himself almost divine honors, treated the people as his slaves, claimed all the land as his personal property, and made everything subservient to his dynastic interests.

The Zulu-Kaffre language is probably the most typical member of the wide-spread Bantu family, standing in much the same relation to the other branches of this stock as Sanskrit does to those of the Aryan group. It is spoken with considerable uniformity throughout the whole Kaffre domain, the Zulu or northern dialects differing rather in idiom and peculiar forms than in structure or phonetics from the Ama-Xosa and other southern varieties. In other respects Zulu is on the whole more primitive and conservative of the oldest forms, while Kaffre seems truer to the original meaning of words. Marked Zulu dialects are the Tefula and Swazi, both widely current in Zululand, the latter forming a transition between Zulu-Kaffre and the northern Tekeza group. The Kaffre, which presents no well-defined dialects, is current from the Keiskamma river to the southern frontier of Natal, and from the Quathlamba mountains to the sea.

The Zulu-Kaffre differs in its phonetics from most other Bantu tongues by the presence of three "clicks" adopted from the Hottentots or Bosjesmans, the true aborigines of this region. These are the dental, usually represented by *c*, as in *Ama-Gcaleka*, the palatal (*q*), as in *Ama-Gqika*, and the lateral (*x*), as in *Ama-Xosa*, uttered respectively by thrusting forward and then suddenly withdrawing the tongue from the front teeth, the palate, and the side teeth. Besides these there is a gutteral, represented by *r*, as in *Rarabe*, to be pronounced *Khakhabe*.[1] The language is in other respects extremely harmonious, the accent falling generally on the penultimate, and all words ending in vowels, or occasionally the liquids *m* and *n*. In its structure it is very regular, with few exceptions or departures from the normal rules, which is the more surprising that its mechanism is extremely delicate and involved. The verb especially is highly inflected, presenting no less than two hundred and fifty different forms, temporal, modal, positive, negative, active, passive, causal, augmentative, etc. In this respect it is probably unsurpassed even by the intricate verbal systems of the Finno-Tatar group.

But the characteristic feature of the Zulu-Kaffre and other Bantu languages is their peculiar alliterative structure, which finds no parallel in any other linguistic family, the Mande and Gor of West Africa alone excepted. This principle of "euphonic concord," as it has been called, is regulated by the pronominal prefix inseparable from every noun, and repeated in a more or less modified form with the following adjectives and other words in agreement with the subject. The nominal root itself is unchangeable, its various relations being expressed by modifications of the prefixed particle, or "inflex," as Colenso calls it. Hence the inflexion in these languages is mainly initial, not final, as in most other linguistic systems, on which account they have received the name of "Pronominal Prefix Languages." Of the inflecting prefixes, of which there were sixteen in the primitive Bantu speech, the chief function is concordance and relationship. Thus the proper inflex of *ntu* in the sense of man, person, being *um*, pl. *aba*, we get from *um-ntu*, man, *aba-ntu*, men.[2] The inflex of *kose*, chief, is *in*, pl. (irreg.) *ama*,[3] whence *in-kose*, a chief, *ama-kose*, chiefs. Then, the adjective "great" being *kulu*, "a great man" will be *umu-ntu om-kulu*, where the inflex *umu* is repeated in the modified form *om* with the adjective *kulu*. But "a great chief" will be *in-kose en-kulu*, where the inflex *in* is in the same way repeated in the modified form *en* with the following adjective *kulu*. Here we see some resemblance both to the principle of progressive vocalic harmony as developed in the Ural-Altaic group, in which the vowel of the root regulates those of all the following agglutinated formative elements, and to such Latin agreements as *filius meus, filia mea*, etc. In both cases, however, the resemblance is more apparent than real. This surprisingly complex and almost artificial principle of alliterative concordance pervading a vast number of languages spread over half a continent, and spoken exclusively by unlettered and barbarous races, is one of the most astonishing phenomena in the history of human culture. The perfection to which the system is carried in the Zulu-Kaffre group must always render that branch of the Bantu family specially interesting to the students of comparative philology.

See Gustav Fritsch, *Die Eingeborenen Süd-Afrika's*, with atlas, 30 plates, and 120 typical heads, Breslau, 1872; Bleek's *Comparative Grammar of the South African Languages*, 1869; Hahn's *Grundzüge*

[1] The *r* sound does not occur; it is replaced, as in Chinese, by *l*.

[2] This word *Abantu* is generally used by the Kaffres in speaking of themselves as the "men" in a pre-eminent sense in opposition to the *Ama-hlungi*, or inferior white people. On this ground *Abantu*, shortened to *Bantu*, has been proposed by Bleek and generally adopted as the collective name of all the races and languages belonging to this great linguistic system, which reaches from four or five degrees north of the equator southward to Cape Colony, and stretches right across the continent from the Ogoway delta to Zanzibar.

[3] The regular plural of the inflex *in* is *izin*, as in *in-hlu*, house *izin-hlu*, houses. But *ama* is extensively used instead of *aba*, *izin*, etc., in forming the plural, especially of personal nouns, nations, tribes, etc. Hence *Ama-Xosa* for *Aba-Xosa* from *um-Xosa*, *Ama-Mpondo* from *u-Mpondo*, *Ama-Kose* from *in-Kose*, etc. The northern and western Bantu nations preserve the *aba* under the forms *ba*, *be*, *wa*, whence *Ba-Suto*, *Be-chuana*, *Wa-nyamwesi*, *Wa-ganda*, etc.

KÂFIRISTÂN. This Persian term, signifying "the country of Kâfirs," or unbelievers (in Islâm), has within the last hundred years become established in geography as the name of a mountain tract on the north of Afghanistan, occupied by tribes which have resisted conversion to the faith which prevails on every side. This faith has no doubt continually gained upon these tribes more or less, and with this encroachment the limits of the Kafir country have shrunk; but the encroachment does not appear to have been large since the name became recognized in geography. Thus Baber (*c.* 1504) speaks of a certain place (Chaghânserâi, in recent maps "Chegarserai") as in the very jaws of Kafiristan, and this continued to apply forty years ago, if not now. Only it is clear that in his time the Kafirs occupied tracts about Bajaur, east of the Kuner river, which they do not pass now except on raids. The country has never been entered, and even the bordering Mahometan tracts have only here and there been touched, by any European, so that we know hardly anything of its internal geography, and not even the external geography with any precision. The northern boundary may be taken as that unvisited part of the watershed of Hindû Kûsh which lies between the Dorah Pass (71° 17′ E. long.) and the Khâwak Pass (69° 53′ E. long.) leading into the Andarâb valley of the province of Kunduz (see AFGHAN TURKESTAN, vol. i. 216). On the east it is limited by Chitrâl or Kâshkâr; on the south and west it is more difficult to define. But 35° N. lat. and 70° E. long. will mark these limits roughly, though the Kafir tribes seem still to extend south of the former line above Jalâlâbâd, whilst their limits are retracted north of the same line above Laghmân. Indeed Kafir villages, though now deserted, exist within Darah Nûr, only 20 miles from Jalâlâbâd. It is believed that the Kafir settlements on some points also pass to the north of Hindu Kush.

Tribes of Kafir kindred, subdued and converted by the Mahometans in comparatively recent times are known as *Nîmcha*, or "half-and-half." Many of these are on good terms with the Kafirs, and trade is carried on through their mediation. A most interesting account by Lieutenant-Colonel Tanner, of some tribes of this class, will be found in the *Proc. Roy. Geog. Soc.* quoted below.

The most important portion of the Kafir tribes apparently occupies the valleys which drain (by the Pech river) into the Kuner or Chitrâl river, below Chaghanserai, in about 34° 49′ N. lat. The most easterly occupy the valley running south from the Dorah Pass, and joining the same river at Bîrkot, about 35° 15′ N. lat. Others are on the headwaters of the Alingar and Alishang rivers, which join in Laghmân, and the most westerly on the sources of the river of Tagâo.

Surrounded by people professing Islam and cherishing slavery, the Kafirs are naturally objects of kidnapping incursions, and these they revenge by sallies from their mountain fastnesses to plunder and kill. Wood, in 1838, found the valley of the Upper Kokcha in Badakhshan deserted on account of Kafir forays. The Lahori Pass from Dîr into Chitrâl was within recent years so beset by Kafir robbers that many Mussulman wayfarers were annually killed, whose graves were marked by cairns and flags, and designated "The Tombs of the Martyrs." Hundreds of those dismal memorials lined the road and damped the traveller's spirits. Raverty mentions a savage invasion of Kafiristan made some thirty years ago by the chief of Bajaur from the southeast, in which villages were sacked and burnt, and the people carried off and sold. Faiz Bakhsh speaks of a like invasion from the north in 1870 by the prince of Badakhshan, which penetrated by the Dozakh Darah or "Hell-glen" to Katôr (which he calls the Kafir capital), bringing back a large number of captives, whom he saw at Faizabad. Whatever difficulty from within prevents the exploration of the Kafir country is due apparently to this atrocious treatment at the hands of their Moslem neighbors.

But the Kafir wars are far from being all external. Some of the tribes wage war with one another, so constant and deadly that Biddulph says their fights with their Mussulman neighbors are comparatively desultory and harmless. Kafirs are said, however, never to kill men of their own village.

The country is, as far as can be gathered, a land of lofty mountains, dizzy paths, and hair-rope bridges swinging over torrents, of narrow valleys laboriously terraced, but of wine, milk, and honey rather than of agriculture; the valleys on the eastern side, however, are described as thickly wooded and very fertile. Though table-lands are spoken of, arable land is scanty. Over the greater part of the country the winter is severe; hence the people depend much on dairy-produce, and consume vast quantities of cheese and curd, besides meat, and fruit, fresh or dried.

The hill country of the Kafirs, and of kindred races long continuing in paganism, which extended from the north of Cabul to the borders of Kashmir, was known to mediæval Asiatics, more or less loosely, as *Bilaur*, a name of ancient origin, which we find in Marco Polo as *Bolor*. *Pashai* also, from the name of one of those races now Mussulman, seems to have had a vague application to part of this region; this name also occurs both in Marco Polo and in Ibn Batuta. *Katôr* likewise has sometimes received a like vague extension.

The first distinct mention of Kafirs as a separate race seems to be in the history of Timur. When that prince, in March, 1398, arrived at Andarâb on his way to invade India, he was met with a cry for help against the Katôr and Siâh-posh (or "black-clothed") Kafirs; and he entered the country of the Katôr from the upper part of the Panjhir valley. It was still winter in the highlands, and the difficulties were great. Timur himself was let down the snows by *glissade* in a basket guided by ropes. The chief of the Kafirs was called the ruler of Katôr, a title which is possibly preserved in the title of the king of Chitrâl (see KÂSHKÂR), besides surviving in the name of one of the greater Kafir tribes. Timur distinguishes between Katôr and Siâh-posh; for he speaks of detaching 10,000 horse against the Siâh-posh country, which lay to the left,—therefore, it would seem, to the north of the country entered by him. This detachment met with great disaster. Timur himself claims decided success, but probably found the country quite impracticable, for he speedily emerged again at Khâwak. He speaks of the abundant fruit trees, of the wine, of the language "distinct from Turki, Persian, Hindi, and Kashmîri," of the weapons as arrows, swords, and slings. The ruler was styled *'Adâlshû*, his residence *Jorkal*, and another large place *Shokal*. Timur caused an inscription to be cut in the defiles of Katôr recording his invasion and its route. Masson tells us that in the Kafir country, on the Najîl or Alishang river, there is a structure still known as Timur's castle.

We hear of the Kafirs again in the *Memoirs* of Baber, of their raids in Panjhir, of their wine and fondness for it,—every man carrying slung round his neck a *khig* or leathern bottle. The occasional mentions of the Kafirs in the *Ain-i-Akbari* seem borrowed from Baber, but this work contains another passage (Gladwin's translation, 1784, ii. 195) which probably originated a story about the Kafirs' descent from Grecks, not yet quite obsolete in Europe. In fact, however, the passage does not appear to refer to the "Kafirs" at all, but to the claim to descent from Alexander of the princes reigning in Swât before the present Yuzufzai,—a claim remarkable enough in itself, and maintained by many other princes of the hill states north of Hindu Kush.

Again, Benedict Goes, travelling from Peshawar to Cabul in 1603, heard of a city (or country) called *Capperstam*, into which no Mahometan might enter on pain of death. Hindu traders might enter, though not into the temples. The people were said never themselves to enter their temples except in black dresses. The country abounded in grapes; the natives drank wine, of which Goes tasted; and all this was so strange that he suspected the people might be Christians. Little or nothing is heard of the Kafirs after this till the publication of Rennell's *Memoir of a Map of Hindostan* (1788),—followed twenty-six years later by Elphin-

stone's *Caubul*, in which a considerable amount of substantial information regarding the Kafirs was given by that admirable writer, of whom the Afghans believed, and with justice, that he had a telescope with which he could see what passed on the other side of a mountain.

The most favorable opportunity ever offered for the exploration of Kafiristan was during the British occupation of Cabul in 1839-40; and a Kafir deputation invited a visit from those whom they had been led to regard as kindred. But they were coldly received, owing to the great jealousy of such intercourse shown by the Afghans.

Colonel Tanner of the Artillery made a spirited attempt to reach the country from Jalâlâbâd in 1879, and spent some time among the Mahometans of Darah Nûr, whose language and customs indicate affinity to their heathen neighbors. But he was carried away dangerously ill, on the very day when a Kafir party arrived at the village to escort him into their country. Similar invitations were brought to Major Biddulph in Chitrâl in 1878. This officer was unable to avail himself of these, but he had unusual opportunities of seeing and gaining information about the people, and his chapter on the *Siâh-posh* is the most authentic account yet available. But there are no doubt local differences, and we must not assume that to be untrue which varies from Biddulph's statements.

The Kafirs are in fact only an aggregation of tribes, probably belonging to one general race, but whose present close juxtaposition is the result of various accidents and invasions which have driven them, in part at least, from the lower countries, and concentrated them in this highland region. They have themselves vague stories to this effect, and (like the Karens of Burmah) one that they formerly possessed writing. Elphinstone heard a Kafir story that brought them from Kandahâr. This may have been a dim tradition, not of the place now so called, but of the Kandahâr of the older Arab geographers, *Gandaritis* of Ptolemy, and *Gandhâra* of the Hindu books, viz., the region of Peshawar and Yusufzai. A clan of the now Moslem tribe of Sâfis is called *Gandhârai*. The *Kamoz* tribe of Kafirs have been surmised to be living representatives of the Kambojas of early Sanskrit, whose name was borrowed by that region in the far East in whose forest depths religions of Indian origin reared weird and stupendous fanes, lately made known. In two other Kafir clans, Aspîns and Ashkîns, one is tempted to trace remnants of the *Aspasii* and *Assaceni* of Alexander's historians, whose seat was about Kuner, Bajaur, and Dîr.

The people are recognized from outside as *Kâfirs* ("infidels") or *Sidh-posh* ("black-clad"—compare the *Melanchlæni* of ancient Scythia); but they use no collective term as applicable to themselves; in many cases different tribes are unable to converse with each other; and apparently they recognize no common tie of nationality. If hard pushed, or speaking with foreigners, they will thus employ the word *Kappra* (for *Kafir*), but so also a Hindu talking to an Englishman will sometimes use the term *Kâlâ âdmi* ("black man") collectively of his countrymen.

The variations in the catalogue of tribes given are endless; indeed, Tanner says explicitly that he never found two people who agreed in the names of four out of five, and the variation in actual lists is greater than this. Major Biddulph's information leads him to divide the whole body into three main tribes (or perhaps topographical divisions):—(1) *Bashgalis*, occupying the eastern valley adjoining Chitrâl, partially tributary to that state,—their principal clan being divided into Kamoz and Kamtoz; (2) *Waigalis*, occupying the Pech valley and its upper waters; (3) *Ramgalis* or *Lamgalis*, on the upper waters of the streams descending towards Laghmân (formerly *Lamghân*) and Cabul, and also apparently extending north of the great watershed. But these great tribes are subdivided into numerous clans, of which the Waigalis alone count eighteen. There are also broken clans, like the *Kalâshas*, adjoining Chitrâl, a degraded race who are claimed by the Bashgalis as their slaves, and the *Kittigalis*, a small tribe near the watershed who are subject to Munjân, one of the highland cantons of Badakhshan.

More copious lists of tribes have been given by Elphinstone (three lists on different authorities), and by Raverty, Lumsden, Bellew, etc. We may notice that all lists give a prominent place to the *Katôr* or *Katâr* (see above). Other names that appear in several lists are *Wâi* or *Wâigal* (already named from Biddulph); *Kâm*, in various forms; *Wâmah*, and *Sânu*, which we learn from Tanner, are names for one great tribe; *Pashâ-gar* or *Pashâ-gri*, suggestive of connection with the now Mahometanized *Pashais* of the Cabul highlands, spoken of above; *Munde-gal*, *Paruni*, *Traiegama*, *Gambîr* or *Gimîr*, *Ashkong* or *Askîn*, *Ashpîn* or *Ishpi*, *Nisha* or *Nishai*, etc. The affix *gale* or *gali*, which attaches to several Kafir names of place and tribe, is to be ascribed to a word *gal* signifying "country." The characteristics of some tribes were given to Tanner by their (*nîmcha*) neighbors the Chugânîs, and ran thus: "In Kafir land are many languages, many tribes with different tongues. The *Katawas* (Katôrs?) are horsemen. The *Parunis* have no guns, they kill men with clubs. The *Majgalis* are beautiful; they have guns and are marksmen; they are men of the chase, very active and swift. The *Wamas* are the nicest of all. But the *Katawas* (Katôrs?) are chief before the *Wamas*. And the *Nishai* are fairer than the *Wamas*."

In regard to the general aspect and complexion of the Kafirs, accounts have varied. Dr. Trumpp, a learned missionary, who examined three Kafirs at Peshawar, declares them to have been in all respects like natives of Upper India, with dark hair and eyes and swarthy color, tinged with ruddiness due to wine. On the other hand Burnes, Atkinson, Wood, and Masson all speak of their blue eyes, nearly all of their brown hair. Bellew describes Faramorz Khan, an officer of Kafir birth in the Afghan service, as of fair, almost florid complexion, and light brown hair, hardly to be distinguished from an Englishman. And, unless their fairness were a general characteristic, one hardly sees how the story current among themselves of their kin to us could have found vogue. The fact seems to be, as Biddulph states, and as the Chugâni characterization quoted above implies, that they differ considerably in complexion, some of those living at high elevations being very fair. In feature those whom he saw were pure Aryans of a high type,—the women handsome (as all native reports make them), with brown hair and eyes, sometimes very fair. Indeed, Sir H. Rawlinson, who repeatedly saw Kafirs at Cabul in 1838-40, has stated that the most beautiful Oriental lady he ever had seen was a Kafir slave; by loosening her golden hair she could cover herself completely from head to foot as with a veil.

The current tale has always been like that told to Goes in 1603 that no Mussulman could enter their land and live. This is true of any one entering without warning; but, on the eastern side at least, they receive visitors when passed in by one of themselves. Thus pedlers with wares from Peshawar enter; and Mahometans from Chitrâl are occasionally allowed to enter the country for sport, and enjoy the hospitality for which the Kafirs are famed. The assurance that they would welcome the visits of Christians has been general, and the invitation often given. Two Afghans from Peshawar, Christian converts, on the invitation of a Kafir who had been a soldier in the Guides under Colonel (now Sir Harry) Lumsden, visited the Kafir country in 1864, and brought back a very interesting journal. They witnessed, soon after entering the country, the treacherous massacre by the Kafirs, in fulfilment of an old vendetta, of a large party of Mohometans who had been invited across the border, but were themselves well treated.

The language of the Kafir tribes belongs, like their physical type, to the Aryan class. On both northern and southern slopes of Hindu Kush are spoken a number of languages and dialects, all of which, with the striking exception of the Khajuna or Burishki in Gilgit, belong to the class named, some of them leaning more to the Persic, some to the Indic (or Prakritic) type. To the first belong especially the dialects of the north known as *Ghâlcha*, spoken in Sirikol, Wakhân, Shighnân, and other cantons of the upper Oxus. To the second belong the Shina language of Dardistan, and other dialects, spoken on the Indus and west of it as far as Chitrâl. Major Biddulph considers the Kafir languages, of which the Khowâr or Chitrâli is a type, to stand between the two classes, drawing on the whole

nearest to the Indic side, but with a larger number of Persic roots than the Dard dialects. Vocabularies of Kafir or Siâh-posh dialects have been published by various persons (*e. g.*, Leech, Burnes, Raverty, Lumsden, Trumpp, Norris, Leitner, Tanner, Biddulph). The most ample are by no means the most valuable; and the data as yet, both as to copiousness and as to precision regarding the locality of the dialects represented, are scanty, though in these respects Major Biddulph's book marks a considerable step. The Hindi character of the list of numerals in some of the dialects is very striking. They all seem to confirm Elphinstone's statement that in all the Kafir dialects the numeration is by scores, as in the French "survival" of *quatrevingt, quatrevingt-dix*, etc.

Biddulph regards the religion of the Kafirs as a crude form of the old Vedic worship. *Imbra* is their chief god, a name suggestive of *Indra*. *Mani* is spoken of as mediating with Imbra on behalf of man. There are many inferior divinities, some acknowledged to have been mortals worshipped after death. Names of some of these are given by Elphinstone and by Biddulph, and a large part of the two lists agree. Stones are set up as emblems of Imbra, but carved idols are not used, says Biddulph; we must perhaps interpolate,—"as representations of Imbra,"—for there is much evidence that images are set up. *Deogan* is a name which several accounts give as that of a chief god,—perhaps a generic word connected with *deo*, *dîv*, *deus*, etc. Colonel Tanner's informants told him of a temple of Deogan among the Wamas, hung about with bright-colored cloths and ornaments, whilst Deogan was represented by a fierce image of wood, armed with club, knife, and gun. The temples are said to be stored with the accumulated spoils of ages. To all the deities cows are sacrificed, and cedar branches burned. On all occasions of slaughtering for food, some deity is invoked and sacrificial ceremonies observed. The Bashgalis showed Biddulph the sacrifice of a goat. The detail is most remarkable, as he points out, in its agreement, even in some of the minutiæ (such as the ritual words used, *sûch!* and *hê-mach!*, with the account given by Elphinstone after Mullah Najîb,—thus attesting the authenticity of the latter's narrative.

Polygamy is practised, and according to the balance of evidence woman's chastity is loose, and adultery slightly punished or easily compensated (but on these points the Afghan Christians give a strongly opposed statement). Female children are freely sold by the Bashgalis to their Mussulman neighbors, and the king of Chitrâl receives an annual tribute of children of both sexes (whom he sells doubtless). The black clothing, which has given the Kafirs a general name, varies in character. Tribes on the Cabul side wear entire goat's skins; the Bashgalis wear short-sleeved black tunics of woven goat's hair, with a broad red binding, and girt with a leather belt bearing a dagger. On their feet they wear rude sandals of wild-goat skin, with a tuft on the instep. The women wear long sack-like garments of black woven goat's hair, with long loose sleeves, girt loosely at the waist, and with a colored cotton scarf tightly bound over the shoulders. It is a general characteristic that men shave the whole head except a circular 3-inch patch on the crown, from which the hair hangs often to the waist. The Bashgalis at least wear no head covering. Women wear the hair plaited in many long thin tresses, coiled under their head-dress. The head-dress of the Bashgali women is remarkable, consisting of a black cap with lappets and two horns about a foot long, made of wood wrapped with black cloth and fixed to the cap. Such a head-dress, with horns of greater length, is described by Chinese travellers of the 6th and 7th centuries as worn in the valley of the upper Oxus, then held by the Yetha or Ephthalites, an indication probably of kindred with or influence over the ancestors of this Kafir tribe. Among the Sanus, Wamas, or red Kafirs, long, massive, silver chains presented by the tribe are worn over the shoulders by successful warriors. Their women tie up the hair with a silver band.

The Kafir arms are bows and arrows, battle-axe and dagger. The dagger is peculiar, of excellent fabric, with a deep ⊥ hilt of iron with brass studs, and slung in a triangular iron sheath. Their bows and arrows are short and weak-looking, but they make good practice up to 60 yards. Swords and matchlocks are spreading.

Among the notable and general customs are the copious use of wine, which at their feasts they drink from large silver cups which are among their most precious possessions; their sitting habitually upon stools of wicker-work, whilst they find it as difficult as we do to adopt the cramped postures usual among Asiatics; their use of slips of pine for candles; the custom of recording the deeds of a warrior by a post beside his coffin, in which a peg is driven for every man he has slain. The Islamized Chugâni people of Darah Nûr also maintain this practice.

The people are fond of dancing. Men and women join. Biddulph witnessed a village dance, wild and strange,—the men brandishing arms, with whooping and whistling and discharge of guns. At times the whole would lock arms by pairs and revolve backwards and forwards in grotesque waltz, or following in order wind in figures of 8.

Their houses are neat and clean, generally of more than one story (communicating by rough ladder beams), and sometimes of five or six on the declivity of a hill. They are much embellished with wood carving. We may assume Tanner's striking description of a large Chugâni village to give a fairer idea of the Kafir towns than we have yet any direct means of gaining:—

"It is built on the face of a very steep slope, and the houses, of which there must be six hundred, are arranged in terraces one above another. From the roof of one of the lower ones I gazed with astonishment at a vast amphitheatre of carved wood—at thousands of carved veranda-posts, and at tens of thousands of carved panels, with which the upper story of each house is constructed. . . . The carving completely covered the woodwork of the upper story of every house. The lower story is of stone and wood, and double the extent of the upper, and this allows an open roof-space on which the inhabitants mostly pass their time in fine weather."

A newborn child is carried with its mother to a special house outside the village, where they remain secluded. After twenty days mother and child are bathed and brought back with music and dancing. The dead are placed in coffins, and, after much dancing and waking and sham fighting, are carried to some lofty spot and there deposited, but no grave is made.

The Siâh-posh dogs, cattle, sheep, fowls, and all their agricultural products are famous for quality, and much sought by their neighbors. Their cattle in appearance and size compare favorably with English breeds, but have large humps. The women are said to do much of the agricultural work.

Roy. As. Soc.* vol. xix. p. 1 *sq.* (H. Y.)

KAHLÚR, also called BILÁSPUR, one of the petty hill states in the Punjab, India, lying between 31° 12′ 30″ and 31° 35′ 45″ N. lat., and between 76° 26′ and 76° 58′ E. long. The area is 448 square miles, and the estimated population 60,000. The principal products are opium and grain; woollen goods are manufactured. The estimated revenue is about £10,000. The Gurkhás overran the country in the early part of the century, and expelled the rájá, who was, however, reinstated by the British in 1815.

K'AI-FUNG FOO is the capital of the province of Honan in China, and is one of the most ancient cities in the empire. A city on the present site was first built by Duke Chwang (774–700 B. C.) to mark off (*k'ai*) the boundary of his fief (*fung*); hence its name. It has, however, passed under several *aliases* in Chinese history. During the Chow, Suy, and T'ang dynasties (557–907) it was known as P'een-chow. During the Woo-tai, or five dynasties (907–960), it was the Tung king, or eastern capital. Under the Sung and Kin dynasties (960–1260) it was called P'een-king. By the Yuen or Mongol dynasty (1260–1368), its name was again changed to P'een-leang, and on the return of the Chinese to power with the establishment of the Ming dynasty (1368–1644), it was rechristened by its original name of K'ai-fung, The city is situated at the point where the last spur of the Kwan-lun mountain system melts away in the eastern plain, and a few miles south of the Yellow river. Its position, therefore, lays it open to the destructive influences of the Hwang-ho. In 1642 it was totally destroyed by a flood caused by the dykes of that river bursting, and on several prior and subsequent occasions it has suffered injury from the same cause. The city is large and imposing-looking, with broad streets and handsome edifices, the most noticeable of which are a twelve-storied pagoda 600 feet high, and a watch tower from which, at a height of 200 feet, the inhabitants are able to observe the approach of the yellow waters of the river in times of flood. The city wall forms a substantial protection, and is pierced by five gates. The whole neighborhood, which is the site of one of the earliest settlements of the Chinese in China, is full of historical associations, and it was in this city that the Jews who entered China in the reign of Ming-te (58–75 A. D.) first established a colony. For many centuries these people held themselves aloof from the natives, and practised the rites of their religion in a temple built and supported by themselves. Of late years, however, they have fallen upon evil times, and in 1851, out of the seventy families which constituted the original colony, only seven remained. For fifty years no rabbi had ministered to the wants of this remnant. Their temple was in ruins, and the people themselves were reduced to the lowest extreme of poverty. In 1853 the city was attacked by the Tai-ping rebels, and, though at the first assault its defenders successfully resisted the enemy, it was subsequently taken. With the ruthlessness common to the Tai-pings the captors looted and partially destroyed the town, which still retains traces of this its latest misfortune. Of the population, which is probably not far short of 100,000, it is estimated that two-thirds of the tradesmen, tavern keepers, educated classes, and attendants at the Government offices are Mahometans. The city, which is situated in 34° 52′ N. lat., and 114° 33′ E. long., forms also the district city of Seang-foo.

KAIRA, a British district in the province of Guzerat, Bombay, India, lying between 22° 26′ and 23° 6′ N. lat., and between 72° 33′ and 73° 21′ E. long., bounded on the N. by Ahmadábád district, on the E. and S. by the river Mahi, and on the W. by Ahmadábád district and the state of Cambay, with an area of 1561 square miles. Except a small corner of hilly ground near its northern boundary, and in the southeast and south where the land along the Mahi is furrowed into deep ravines, Kaira district forms one unbroken plain, sloping gently towards the southwest. The north and northeast portions are dotted with patches of rich rice land, broken by untilled tracts of low brushwood. The centre of the district is very fertile and highly cultivated; the luxuriant fields are surrounded by high growing hedges, and the whole country is clothed with clusters of large, shapely trees. To the west this belt of rich vegetation passes into a bare though well-cultivated tract of rice land, growing more barren and open till it reaches the maritime belt, whitened by a salt-like crust, along the Gulf of Cambay. The chief rivers are the Mahi on the southeast and south, and the Sábarmati on the western boundary. The former, owing to its deeply cut bed and sand-banks, is impracticable for either navigation or irrigation; but the waters of the Sábarmati are largely utilized for the latter purpose. A smaller stream, the Khári, also waters a considerable area by means of canals and sluices.

The census of 1872 returned the population at 782,733 (419,142 males and 363,591 females). Hindus numbered 711,619; Musalmáns, 70,741; Pársís, 68; and Christians 305, of whom 243 are natives. Among the Hindus the most important classes are the Lewa and Kadwa Kumbis, numbering 144,639; they are the best cultivators in the district, sober, peaceful, and industrious. The Rájputs, with the exception of a few who with the title of thákur still retain landed estates, have sunk into the mass of ordinary peasant proprietors. The Kolís number 281,252; idle and turbulent under native rule, they are now quiet, hard-working, and prosperous. Among the Hindu low castes, numbering 61,834, the Dhers are distinguished for industry and good behavior. They formerly lived in comfort by weaving coarse cotton cloth, but the competition of the Bombay and local steam mills is now shutting them out of the market. Of the Musalmán population, about one-third represent the foreign conquerors of Guzerat; the remainder are the descendants of converted Hindus. The first class, employed chiefly as cultivators, or in Government service as police and messengers, are for the most part poor; the second class, who are artisans, chiefly weavers and oil-pressers, are hard-working and well-to-do. Thirteen towns contain more than 5000 inhabitants each. Agriculture forms the support of upwards of two-thirds of the population. In 1876–77, 362,221 acres, or 75 per cent. of the Government cultivable land, were under tillage, and 20,753 acres fallow or under grass. Food grains comprise upwards of 88 per cent. of the crops; pulses, 8 per cent.; oil-seeds, 1 per cent.; fibres, 1 per cent.; the remainder being taken up by miscellaneous crops, chiefly tobacco, which has the reputation of being the finest in western India. The manufactures comprise soapmaking, glassmaking, calico printing, and handloom weaving of coarse cloth. A steam spinning and weaving mill has been recently established. The exports are grain, tobacco, butter, oil, and the petals of the *mahuá* tree; the imports, piece-goods, groccries, molasses, and dyestuffs. About 40 miles of the Bombay, Baroda, and Central India Railway pass through the district.

The revenue administration of the district is conducted by a collector-magistrate and three assistants; for judicial purposes Kaira is included within the jurisdiction of the judge of Ahmadábád. The total imperial, local, and municipal revenue in 1875–76 was £249,314, of which £195,184 was derived from the land. Education was afforded in 1876–77 by 189 schools, attended by 14,720 pupils. Kaira possesses a public library, and in 1876 published three vernacular newspapers. The prevailing diseases consist of fevers of a malarious type. The average rainfall during the five years ending 1876 was 30 inches.

Kaira district has no independent history of its own. It is made up partly of lands acquired from the peshwá in 1802, and partly of territory acquired from the gáekwár of Baroda in 1803 and 1817.

KAIRA, chief town and headquarters of the above district, situated 5 miles southwest of Mehmadábád railway station, in 22° 44′ 30″ N. lat., and 72° 44′ 30″ E. long. It is a very ancient city, having a legendary connection with the *Mahábhárata*, and is proved by the evidence of copperplate grants to have been known as early as the 5th century. Early in the 18th century it passed to the Babi family, with whom it remained till 1763, when it was taken by the Marhattás; it was finally handed over to the British in 1803. It was a large military station till 1820, when the cantonment was removed to Deesa. Population (1872), 12,681.

KAIRWAN, KIRWAN, KEROUAN (properly KAIRAWÁN), the Mecca of northern Africa, is a city of the regency of Tunis, 30 miles inland from Susa, and about 80 miles due south from the capital. It is built in an open plain a little to the west of a stream which flows south to the Sidi el Heni lake. Of the luxuriant gardens and olive groves which form so prominent a feature in the early Arabic accounts of the place hardly a remnant has been left. The total

circuit of the walls, according to Edward Rae, is about 3500 yards; and the population is variously estimated from 20,000 to 22,000. A little modification of the eastern wall would make the plan an irregular hexagon. Kairwan is emphatically a religious city: no Jew is permitted to enter within its gates, and it is only at rare intervals that access has been obtained by Christian travellers, though for them in ordinary circumstances the real danger is reduced to a minimum. The more important mosques are only six in number, but the variety of the lesser religious structures is exceedingly great, and several parts of the city are crowded with the tombs of saints and warriors of the Mahometan faith. In the northern quarter stands the great mosque founded by 'Okba ibn Náfi' el Fehri, and containing within its sacred precincts the shrine of this great defender of the faith and the tombs of the kings of Tunis. It has a length of 140 yards, and the southeast and northeast ends measure respectively 85 and 75 yards. To the outside it presents a heavy buttressed wall, with little of either grandeur or grace, but in the interior, in spite of whitewash and paint, it has that magnificence of marble columns which fitted it to be the prototype of the mosque of Cordova. As no European footstep has traversed its arcades, the number of the columns has not been ascertained, but there are at least upwards of 400 of them—a mingled spoil from the Roman ruins of the surrounding country. To the Mahometan mind the crowning distinction of the building is that through Divine inspiration the founder was enabled to set it absolutely true to Mecca. In the central aisle are two pillars between which the people believe that no person with the guilt of mortal sin upon him can by any possibility pass. A unique collection of ancient armor is preserved in one of the chambers. Of greater external beauty than the great mosque is the mosque of the Three Gates. The shrine of Sidi Ibn 'Isá is worthy of note for the peculiar conjuring performances carried on every Friday by the followers of its founder; and that of the Companion (*i.e.* of the Prophet) outside of the walls is specially sacred as possessing three hairs of the Prophet's beard. Formerly famous for its carpets and its oil of roses, Kairwan is now known in northern Africa rather for copper vessels, articles in morocco leather, potash, and saltpetre. In almost every respect it has greatly declined.

The Arabic historians relate the foundation of Kairwan by 'Okba with miraculous circumstances (Ṭabary, ii. 63; Yákút, iv. 213). The date is variously given (see Weil, *Gesch. d. Chalifen*, i. 283 *sq.*); according to Ṭabary it must have been before 670.

See Grenville T. Temple, *Excursions in the Mediterranean*, 1835; Edward Rae, *The Country of the Moors*, 1873; R. L. Playfair, *Travels in the Footsteps of Bruce*, 1877.

KAISARIEH. See CÆSAREA, vol. iv. p. 568.

KAISERSLAUTERN, the chief town of a circle in the government district of Rheinpfalz, Bavaria, is situated on the Lauter, in the hilly district of Westrich, about 40 miles west of Mannheim, and is one of the most important industrial towns of the Palatinate. It is the seat of the usual official bureaus, and counts among its educational institutions a gymnasium, a Protestant normal school, a commercial school, and an industrial museum. There are several churches, of which one owes its first foundation to Frederick Barbarossa, a hospital, and a large fruit-market. The house of correction occupies the site of Barbarossa's castle, built in 1153, and demolished by the French in 1713. The industries include cotton and wool spinning and weaving, iron-founding, and the manufacture of beer, tobacco, and numerous other articles. There is some trade in fruit and in timber. Population in 1905 52,306.

Kaiserslautern takes its name from the emperor (Kaiser) Frederick I., who presented to the place a wood worth 50,000 marks annually. In 1276 it became a town, and in 1357 passed to the Palatinate. In 1621 it was taken by the Spanish, in 1631 by the Swedish, in 1635 by the imperial, and in 1713 by the French troops. During 1793 and 1794 it was the scene of active fighting; and in the Franco-Prussian war of 1870 it was the base of operations of the second German army, under Prince Frederick Charles. It was one of the early stations of the Reformation, and in 1849 was a focus for the revolutionary spirit in the Palatinate.

KAISERSWERTH, an ancient town in the circle and government district of Düsseldorf, Prussia, is situated on the right bank of the Rhine, 6 miles below Düsseldorf. It contains an old Romanesque church of the 12th or 13th century, and has several benevolent institutions, of which the chief is the training-school for Protestant sisters of charity. This institution, founded by Pastor Fliedner in 1836, has more than 100 branches, some even in Asia and America; the head establishment at Kaiserswerth includes an orphanage, a lunatic asylum, and a Magdalen institution. The Roman Catholic hospital occupies the former Franciscan convent. The population in 1905 was 2,462, chiefly engaged in silk-weaving and tobacco manufacture.

In 710 Pippin of Heristal presented the site of the town to Bishop Suitbert, who built the Benedictine monastery round which the town gradually formed. Until 1214 Kaiserswerth lay on an island, but in that year Count Adolphus V. of Berg, who was besieging it, dammed up effectually one arm of the Rhine. About the beginning of the 14th century Kaiserswerth was pawned by the empire to Jülich, whence, after some vicissitudes, it finally passed into the possession of the princes of the Palatinate, whose rights, long disputed by the elector of Cologne, were legally settled in 1762. In 1702 the fortress was captured by the Austrians and Prussians, and the Kaiserburg, whence the young emperor Henry IV. was abducted by Archbishop Hanno in 1062, blown up.

KAITHAL, or KYTHAL, an ancient town in Karnál district, Punjab, India, 29° 48′ 7″ N. lat., 76° 26′ 26″ E. long. It is said to have been founded by the mythical hero Tudishthira, and is connected by tradition with the monkey-god Hanúmán. In 1767 it fell into the hands of the Sikh chieftain, Bhai Desu Sinh, whose descendants, the Bhais to Kaithal, ranked among the most important and powerful Cis-Sutlej chiefs. Their territories lapsed to the British in 1843. There is some trade in grain, sal-ammoniac, live stock, and blankets; and saltpetre and lac ornaments and toys are manufactured. Population in 1868, 14,490.

KAKAPO, the Maori name, signifying "Night-Parrot," and frequently adopted by English writers, of a bird, commonly called by British colonists in New Zealand the "Ground-Parrot" or "Owl-Parrot." The existence of this singular form was first made known in 1843 by Dieffenbach (*Travels in N. Zealand*, ii. p. 194), from some of its tail-feathers obtained by him in the interior of that country, and he suggested that it was one of the *Cuculidæ*, possibly belonging to the genus *Centropus*, but he added that it was becoming scarce, and that no example had been seen for many years. The late Mr. G. R. Gray, noticing it in June, 1845 (*Zool. Voy. "Erebus" and "Terror,"* part ix. p. 9), was able to say little more of it, but very soon afterwards a skin was received at the British Museum, of which, in the following September, he published a figure (*Gen. Birds*, part xvii.), naming it *Strigops*[1] *habroptilus*, and rightly placing it among the Parrots, but he did not describe it technically for another eighteen months (*Proc. Zool. Society*, 1847, p. 61), by which time some further information concerning it had been furnished by Sir George Grey (*Ann. Nat. History*, xviii. p. 427) and the late Mr. Strange (*Proc. Zool. Society*, 1847, p. 50); while in the same year Jules Verreaux sent an example, with an account of its habits, to the museum of Paris, which was published by Dr. Pucheran (*Rev. Zoologique*, 1847, p. 385). Various observers, among whom must be especially named Drs. Lyall (*Proc. Zool. Society*, 1852, p. 31) and Haast (*Verh. zool.-bot. Gesellsch. Wien*, 1863, p.

[1] This generic term was subsequently altered by Van der Hoeven, rather pedantically, to *Stringops*, a spelling now generally adopted.

1115) supplied other particulars, and many specimens have now been received in Europe, so that it is represented in most museums, and at least half a dozen examples have reached England alive. Yet, though much has been written about it, there is no detailed description of its internal structure, which fact is the more to be regretted since the bird is obviously doomed to early extinction, and the opportunity of solving several zoological problems of great interest, which a minute examination of its anatomy might afford, will be lost if some one does not speedily take the matter in hand. Few existing birds offer a better subject for a monographer, and it is to be hoped that, if perish the genus and species must, posterity will not have to lament the want of an exhaustive treatise on its many and wonderful characteristics.

In habits the Kakapo is almost wholly nocturnal,[1] hiding in holes (which in some instances it seems to make for itself) under the roots of trees or rocks during the daytime, and only issuing forth about sunset to seek its food, which is solely vegetable in kind, and consists of the twigs, leaves, seeds, and fruits of trees, grass, and fern-roots—some observers say mosses also. It sometimes climbs trees, but generally remains on the ground, only using its comparatively short wings to balance itself in running, or to break its fall when it drops from a tree—though not always then—being apparently quite incapable of real flight. It thus becomes an easy prey to the marauding creatures—cats, rats, and so forth—which European colonists have let loose in New Zealand, so disastrously for its indigenous inhabitants. Sir G. Grey says it had been, within the memory of old people, abundant in every part of that country, but (writing in 1854) was then found only in the unsettled districts. But as the latter are continually suffering from encroachment, so are the haunts of the Kakapo, and it is to be remarked that, from some cause unknown to us, there are localities which, though unsettled, it does not seem to inhabit, and thus little hope can be entertained of its surviving much longer.

The Kakapo is about the size of a Raven, of a green or brownish-green color, thickly freckled and irregularly barred with dark brown, and dashed here and there with longitudinal stripes of light yellow. Examples are subject to much variation in color[2] and shade, and in some the lower parts are deeply tinged with yellow. Externally the most striking feature of the bird is its head, armed with a powerful beak, that it well knows how to use, and its face clothed with hairs and elongated feathers that sufficiently resemble the physiognomy of an Owl to justify the generic name bestowed upon it. Of its internal structure little has been described, and that not always correctly. Its furcula has been said (*Proc. Zool. Society*, 1874, p. 594) to be "lost," whereas the clavicles, which in most birds unite to form that bone, are present, though they do not meet, while in like manner the bird has been declared (*op. cit.*, 1867, p. 624, note) to furnish among the *Carinatæ* "the only apparent exception to the presence of a keel" to the sternum. The keel, however, is undoubtedly there, as remarked by MM. Blanchard (*Ann. Nat. Sc. Zoologie*, ser. 4, xi. p. 83) and A. Milne Edwards (*Ois. Foss. de la France*, ii. p. 516), and, though much reduced in size, is nearly as much developed as in the DODO and the WEKA (*qq.v.*). The aborted condition of this process can hardly be regarded but in connection with the incapacity of the bird for flight, and may very likely be, as some have supposed, the result of disuse. There can be scarcely any doubt as to the propriety of considering this genus the type of a separate Family of *Psittaci*; but whether it stands alone, or some other forms (*Pezoporus* or *Geopsittacus*, for example, which in coloration and habits present some curious analogies) should be placed with it, must await future determination. In captivity the Kakapo is said to show much intelligence, as well as an affectionate and playful disposition, soon attaching itself to its master and taking pleasure in caressing him and being caressed in turn. Unfortunately it does not seem to share the longevity characteristic of most Parrots, and none that have been held in confinement appear to have long survived, while many succumb speedily. For further details the reader may be referred to Gould's *Birds of Australia* (ii. p. 247) and *Handbook* (ii. p. 539), Dr. Finsch's *Die Papageien* (i. p. 241), and Mr. Buller's *Birds of New Zealand* (p. 26)—in which last work nearly all the information hitherto recorded is to be found.

(A. N.)

[1] It has, however, been occasionally observed abroad by day; and, in captivity, one example at least is said to have been just as active by day as by night.

[2] A specimen in the British Museum (*Zool. Voy. "Erebus" and Terror,"* pt. xxii. pl. 7) has the prevailing green tint replaced by blue of several shades, and has been described as a distinct species, *S. greyi*; but it is obviously in an abnormal condition, and its specific distinctness cannot be maintained without further evidence.

KÁLABÁGH, or KULABAGH, a town in Bannu district, Punjab, India, in 32° 57′ 57″ N. lat., 71° 35′ 37″ E. long., picturesquely situated at the foot of the Salt Range, on the right bank of the Indus, where the river debouches from the hills, 105 miles below Attock. The houses nestle against the side of a precipitous hill of solid rock-salt, piled one upon another in successive tiers, the roof of each tier forming the street which passes in front of the row immediately above, and a cliff, also of pure rock-salt, towers above the town. The salt is quarried (about 2700 tons in 1871–72) at Mári, opposite the town, where it stands out in huge cliffs, practically inexhaustible. The similar outcrop at Kálabágh itself is not quarried. Alum also occurs in the neighboring hills, and forms a considerable item of local trade. Iron implements are manufactured. Population in 1868, 6419.

KALAMATA, chief town of the modern Greek monarchy of Messenia in the Morea, is situated on the left bank of the Nedon, about a mile from the sea. There is a suburb on the right bank of the stream. On a hill behind the town are the ruins of a mediæval castle; but no ancient Greek remains have been discovered, although modern travellers have identified the site with that of the classical Pharæ or Pheræ. It is the seat of a court of justice and of an archbishop. Kalamata is situated in a very fruitful district, of which it is the emporium. The roadsteads are safe in summer only; in the winter months the fishing craft take shelter in the haven of Armyro. The value of the chief exports in 1879 and 1880 was as follows:—currants, £111,750 and £109,200; figs, £112,730 and £87,186; olive oil, £21,340 and £12,789; silk, £34,230 and £31,215. The population in 1897 was 14,298.

Pharæ, Pheræ, or Phere was founded, according to Pausanias, by Pharis, son of Hermes; and the antiquity of its origin is still further assured by its mention in the *Iliad* (v. 543, ix. 151), and the *Odyssey* (iii. 490, xvii. 186). When Messene was captured (182 B.C.) by the Achæans, Pharæ became a distinct member of the Achæan league. During the Middle Ages it was for a time a fief of the Villehardouins. In 1685 Kalamata was captured by the Venetians; in 1770, and again in 1821, it was the revolutionary headquarters in the Morea. In 1825 it was sacked by Ibrahim Pasha.

KALAMAZOO, the county seat of Kalamazoo county, Michigan, U. S., 40 miles east of Lake Michigan, and equi-distant from Chicago and Detroit, at the intersection of four railways, in the centre of one of the finest agricultural districts in the country. The public institutions include Kalamazoo College, the Michigan Female Seminary, and an asylum for the insane. About one-third of all the windmills in the United States are made here. Agricultural implements, carriages, steel springs, paper and milling machinery are among the chief manufactures; and there are also extensive planing mills and flour mills. The population of the town in 1900 was 24,404, against 11,937 in 1880.

KALATCH, a town of Russia, in the country of

the Don Cossacks, on the left bank of the Don above the confluence of the Karpovka, in 48° 43′ N. lat. and 43° 30′ E. long. Previous to the opening of the railway to Tsaritsin on the Volga, it was a place of only 500 inhabitants, but since that date (1862) it has increased to more than 12,000 inhabitants; and its transit trade has received a great development.

KALBE, or CALBE, AN DER SAALE, chief town of a circle in the government district of Magdeburg, Prussia, is situated on the Saale, 3 miles from the Saale (Grizehne) station on the Leipsic and Magdeburg Railway. It contains a local court, a middle school, and several benevolent institutions. The industries of the place include wool-spinning, and the manufacture of cloth, oil, paper, bricks, beet-root sugar, and tobacco. Cucumbers and onions are largely cultivated in the neighborhood; and anthracite is excavated. In 1875 the population was 7982; with the adjacent Bernburger and Schlossvorstadt it was 12,264 in 1905.

KALEIDOSCOPE. This, as the name implies, is an instrument by means of which beautiful forms may be seen. It was invented by Sir David Brewster about 1815,—the idea of the instrument having occurred to him some time before while he was engaged with experiments on the polarization of light by reflection. When it first appeared it attracted almost universal attention. This arose from the extreme beauty of the forms which it presented, their endless variety and perfect symmetry, as well as the readiness with which one beautiful form could be converted into another. The construction of the instrument was so simple, too, that almost any one could make it; and, in consequence, the patent originally taken out by Brewster was persistently evaded; kaleidoscopes were made by the hundred, and sold in almost every toy-shop. Large cargoes of them were sent abroad; and it is stated that no fewer than two hundred thousand were sold in London and Paris in the space of three months. Besides being of essential service in the art of the designer, the kaleidoscope constitutes a very useful piece of philosophical apparatus, as it illustrates, in a very beautiful way, the optical problem of the multiplication of images produced by reflection when the object is placed between two plane mirrors inclined to each other at a definite angle.

The general principle of the instrument will be easily understood from the following description and figures.

1. Let OA, OB (Fig. 1) be the sections of two plane mirrors placed perpendicular to the plane of the paper and inclined to each other at a right angle. Let P be a luminous point, or object, placed between them. According to the general law of the reflection of light from plane mirrors, the image of P formed by the mirror OA will be as far behind OA as P is in front of it; that is, the image of P is P_1, where $PX = P_1X$, the line PP_1 being perpendicular to OA. Now P_1 may be regarded as a new object placed before the mirror OB, and hence the image of P_1 formed by OB will be P_2 where $P_1Y_1 = P_2Y_1$. Similarly the image of P formed by OB will be P_1', where $PY = P_1'Y$, and the image of P_1' formed by OA will also be at a point such that $P_1'X_1 = P_2X_1$, that is, the two last-formed images will coincide. Hence we have three images placed symmetrically about O, constituting, with the object P, a symmetrical pattern of four luminous points placed at the corners of a rectangle.

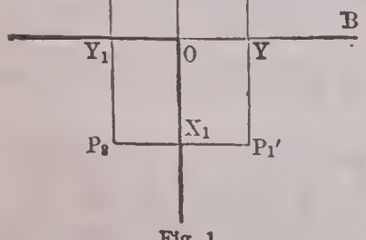

Fig. 1.

2. Let the mirrors OA and OB (Fig. 2) be inclined to each other at any angle a, and let P be the object placed between them. With centre O and radius OP describe a circle. Evidently the images formed by successive reflections from the mirrors will all lie on the circumference of this circle. We shall denote the images formed by a *first* reflection at OA, *second* at OB, *third* at OA, and so on, by the symbols P_1, P_2, P_3 respectively; and the images formed by a *first* reflection at OB, *second* at OA, *third* at OB, and so on by P_1', P_2', P_3' respectively. Draw PP_1 perpendicular to OA, P_1P_2 perpendicular to OB, P_2P_3 perpendicular to AO produced, and P_3P_4 perpendicular to BO produced. Then P_1, P_2, P_3, P_4 are the first set of images formed.

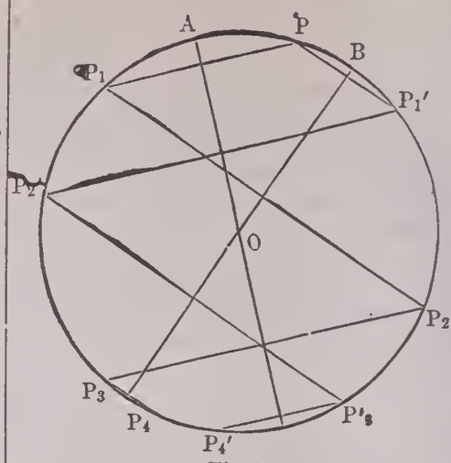

Fig. 2.

Similarly draw the lines PP_1', $P_1'P_2'$, $P_2'P_3'$, $P_3'P_4'$, then P_1', P_2', P_3', P_4' are the second set of images formed by a first reflection at OB. Now, when any image falls within the angle vertically opposite to AOB, it is evident that no further reflection can take place, as it is behind both mirrors. Hence the number of images formed depends upon the size of the angle AOB and also upon the position of the point P in relation to the mirrors.

When a symmetrical picture is required, it is essential that the two last-formed images, that is, P_4 and P_4' in the figure, should coincide, and we must determine when this will be the case. We shall measure the distances of the several images from P by the arcual distances PP_1, etc. Now it is evident that

$$P_1PP_1' = 2PA + 2PB = 2AB = 2a.$$
$$P_2PP_2' = PP_2 + PP_2' = PB + P_1B + PA + P_1'A$$
$$= PB + PA + AB + P_1A + AB + P_1'B$$
$$= 4AB = 4a.$$
$$P_3PP_3' = 6a.$$
$$\cdots\cdots\cdots$$
$$P_nPP_n' = 2na.$$

Now, when the last-formed images coincide, the arcual distance between them must be a whole circumference. Hence if P_n and P_n' be the last-formed coincident images, we have

$$P_nPP_n' = 2na = 2\pi.$$

Hence $a = \frac{\pi}{n}$; that is, the mirrors must be inclined to each other at an angle which is an exact submultiple of two right angles, or, which is the same thing, an even submultiple of 360°.

3. Next suppose that, instead of a point, we put a line as an object in the angle between the mirrors; and, first, let us suppose that the mirrors are inclined to each other at an angle which is an odd submultiple of 360° (as one-fifth of 360° in Fig. 3). OA, OB are the mirrors, PQ the line placed between them. The image of PQ formed by OA is PQ_1, that formed by OB is QP_1. The image of PQ_1 formed by OB is P_1Q_2, and the image of QP_1 formed by OA is Q_1P_2. Now it is readily seen that the points P_2 and Q_2 will not, in general, coincide, and, hence, a symmetrical picture of the line cannot in general be formed when the angle is an odd submultiple of 360°. If, however, the line OP = OQ, then the points P_2 and Q_2 will coincide, and a symmetrical picture of five lines be formed. Secondly, let us suppose that the angle AOB is an even submultiple of 360°. By following the course of the images it will be seen that the last-formed images of the line coincide in all positions of PQ, and hence a symmetrical figure can, in all cases, be formed.

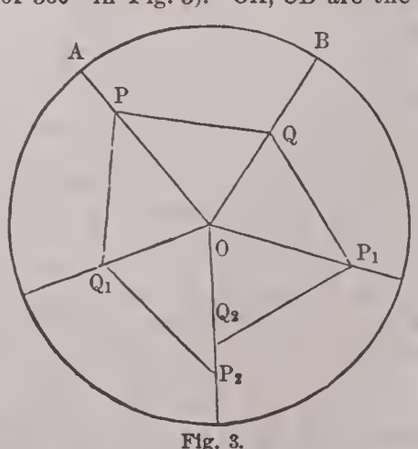

Fig. 3.

As the object of the kaleidoscope is to produce symmetrical figures from objects placed in any position between

the mirrors, we are necessarily limited to angles which are *even* submultiples of 360°.

The simple kaleidoscope consists essentially of two plane mirrors EOA and EOB (Fig. 4) inclined to each other at an angle which is an even submultiple of 360°. A very common angle in practice is 60°. The mirrors are usually made of two strips of thin flat glass,—the length of each being from 6 to 12 inches, and the

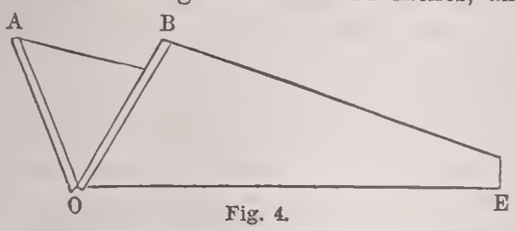

Fig. 4.

greatest breadth from 1 to 3 inches. The mirrors are first fixed, in any convenient manner, at the proper angle, and then inserted into a cylindrical tube of brass or paper. At the one end of the tube is a small eye-hole opposite the point E, while the other end is closed by what is called the "object box." This consists of a shallow cylindrical box, which fits on to the end of the tube, and contains the objects from whose reflection the pattern is produced. These objects may consist of petals of differently colored flowers, scraps of differently colored paper, or, still better, pieces of colored glass. Very often the objects consist of small glass tubes filled with differently colored liquids and then hermetically sealed. These produce a very fine effect. The objects are placed in the box between two circles of thin glass which fit into the box, the one of which is transparent and the other obscured by grinding. When in position the transparent glass is close to the end of both mirrors and fills up the sector AOB, while the other, the obscured one, is fixed into the outer end of the object box. The distance between the two glasses is made as small as possible,—just room enough being left to allow the objects to fall freely by their own weight into any position between the glasses. Suppose now that the angle AOB is 60°, and that the eye is placed at E, a beautiful symmetrical picture of six equal and similar sectors will be seen round the point O; and, by simply turning the tube round, so as to allow the objects to fall into a new position, an endless variety of pictures can be produced.

It is important to notice the proper position of the eye. This should be, as nearly as possible, in the plane of both mirrors,—first, because in that position only the direct and reflected sectors are all at the same distance from the eye, and, in consequence, no want of symmetry is introduced by the foreshortening of one sector more than another; and, secondly, because in that position the maximum amount of light is reflected to the eye by the mirrors, and, in consequence, the various sectors appear as nearly as possible equally illuminated. Of course a certain amount of light is necessarily lost at each reflection, and hence there is always a slight difference between the luminosity of the various sectors. However, this is found not to introduce any serious want of symmetry when the instrument is properly constructed.

A modification of the simple kaleidoscope was introduced by Sir David Brewster, whereby the images of large and distant objects can be introduced into the picture. This is effected by removing the object box

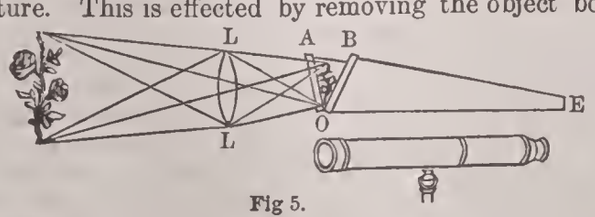

Fig 5.

and replacing it by a tube carrying at its outer end a double convex lens, represented by LL in fig. 5. By a screw adjustment the lens can be so placed as to focus the distant object exactly in the plane of the sector AOB, and so bring its image into the very best position for producing symmetrical patterns. When this instrument is directed towards a tree in full foliage, or towards an arrangement of flowers in full bloom, a very beautiful effect is produced, which can be varied by gradually moving the instrument. This form was called by Brewster the *telescopic kaleidoscope*.

Another form is called the *polyangular kaleidoscope*, (fig. 6). The only essential difference in it is that the mirrors are so arranged that the angle between them can be varied at pleasure. This, being very useful for illustrating the theory of the instrument, is the form usually found in collections of philosophical apparatus.

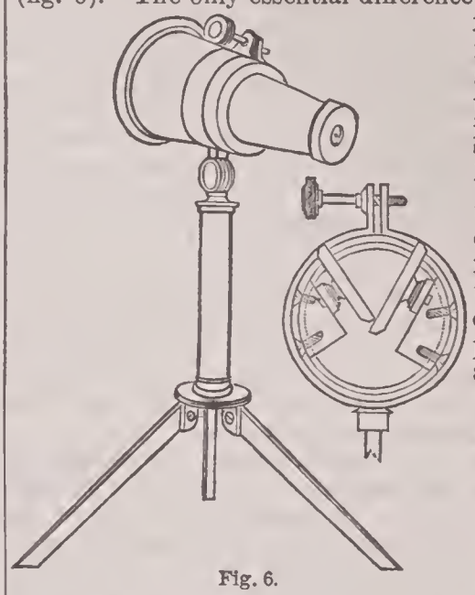

Fig. 6.

In all the instruments above described only two mirrors have been employed; but obviously we may have more than two. Suppose we wish to employ three mirrors enclosing a triangular opening, and that we also wish to produce perfectly symmetrical pictures. We are here limited in our choice of angles by the following conditions—first, the sum of the three angles which the mirrors make with each other must be equal to 180°, and, secondly, each angle must be an even submultiple of 360°. By trial it is easily found that the only angles which satisfy these conditions are 60°, 60°, 60°; 90°, 60°, 30°; and 90°, 45°, 45°. Hence with three mirrors we must choose one or other of these three sets. The first is that usually chosen.

Suppose similarly we wish to use four mirrors; then, we must put them either in the form of a square, when all the mirrors are of equal breadth, or in the form of a rectangle, when the opposite mirrors are of equal breadth. It is obvious that in these two cases only will the angle between each pair of mirrors be an even submultiple of 360°.

With more than four mirrors kaleidoscopes cannot be constructed so as to give symmetrical forms, since each of the interior angles of a regular polygon of more than four sides must exceed an even submultiple of 360°.

See Harris's *Optics;* Wood's *Optics;* Parkinson's *Optics;* Brewster's *Treatise on the Kaleidoscope.* The last-mentioned contains an account of the application of the instrument to the art of designing.

(J. BL.)

KALGAN, or CHANG-KEA-KOW, a large city of China, in the province of Chih-li, with a population estimated at from 60,000 to 70,000. It lies in the line of the Great Wall, 137 miles northwest of Peking, "commanding one of the most important passes between China and Mongolia and the main road of the overland route between China and Russia" (Bushell). Fritsche gives its position as in 40° 50′ N. lat. and 114° 54′ E. long., and its height above the sea as 2810 feet. The valley amid the mountains in which it is situated is under excellent cultivation, and thickly studded with villages. Kalgan consists of a walled town or fortress and suburbs 3 miles long. The streets are wide, and excellent shops are abundant; but the ordinary houses have rather an odd appearance, from the fact that, like those of Erzeroum, they are usually roofed with earth and become covered with green sward. Large quantities of soda are manufactured; and the position of the town renders it the seat of a very extensive transit trade. In early autumn long lines of camels come in from all quarters for the conveyance of the tea-chests from Kalgan to Kiakhta; and each caravan usually makes three journeys in the winter. There is

an excellent inn in the town frequented by the Russian merchants, some of whom have permanent residences and warehouses just outside the gate. On the way to Peking the road passes over a beautiful bridge of seven arches, ornamented with marble figures of monkeys, lions, tigers, and other animals. The name Kalgan is Mongolian, and means a barrier or "gate-beam."

KÁLIDÁSA is the most illustrious name among the writers of the second epoch of Sanskrit literature, which, as contrasted with the age of the Vedic hymns, may be characterized as the period of artificial poetry. Owing to the utter absence of the historical sense in the Hindu race, it is impossible to fix with chronological exactness the lifetime of either Kálidása or any other Sanskrit author. Native tradition places him in the 1st century B.C.; but the evidence on which this belief rests has been shown to be wholly worthless. The works of the poet have been found to contain no allusions by which their date can be directly determined; yet the extremely corrupt form of the Prákrit or popular dialects spoken by the women and the subordinate characters in his plays, as compared with the Prákrit in inscriptions of ascertained age, has led the chief authorities, Weber and Lassen, to agree in fixing on the 3d century of our era as the approximate period to which the writings of Kálidása should be referred.

The richness of his creative fancy, his delicacy of sentiment, and his keen appreciation of the beauties of nature, combined with remarkable powers of description, which are conspicuous throughout his works, place Kálidása in the first rank of Oriental poets. The effect, however, of his productions as a whole is greatly marred by extreme artificiality of diction, which, though to a less extent than in other Hindu poets, not unfrequently takes the form of puerile conceits, and plays on words, the matter being treated merely as a means for displaying dexterity in the manipulation of the language. In this respect his writings contrast very unfavorably with the more genuine poetry of the Vedas. Though a true poet, he is wanting in that artistic sense of proportion so characteristic of the Greek mind, which exactly adjusts the parts to the whole, and combines form and matter into an inseparable poetic unity. Kálidása's fame rests chiefly on his dramas, but he is also distinguished as an epic and a lyric poet.

He wrote three plays, the plots of which all bear a general resemblance to each other, inasmuch as they consist of love intrigues, which, after numerous and seemingly insurmountable impediments of a similar nature, are ultimately brought to a successful conclusion.

Of these, *Çakuntalá* is that which has always justly enjoyed the greatest fame and popularity. The unqualified praise bestowed upon it by Gocthe sufficiently guarantees its poetic merit. There are two recensions of the text in India, the Bengalí and the Devanágarí, the latter being generally considered older and purer. *Çakuntalá* was first translated into English by Sir William Jones (Calcutta, 1789), who used the Bengalí recension. It was soon after translated into German by G. Forster (1791), and by Herder in 1803. An edition of the Sanskrit original, with French translation, was published by Chézy at Paris in 1830. This formed the basis of a translation by Hirzel (Zurich, 1830). Another edition of the Bengalí recension was published by Prema Chandra (Calcutta, 1860) for the use of European students. The Devanágarí recension was first edited by Böhtlingk (Bonn, 1842), with a German translation. On this were based the successive German translations of Meyer (Tübingen, 1851) and Lobedanz (2d ed., Leipsic, 1861). The same recension has been edited by Dr. C. Burkhard with a Sanskrit-Latin vocabulary and short Prakrit grammar (Breslau, 1872), and by Professor Monier Williams (Oxford, 2d ed., 1872). Another edition was published at Bombay in 1861.

The *Vikramorvaçí*, or *Urvaçí won by Valor*, abounds with fine lyrical passages, and is of all Indian dramas second only to *Çakuntalá* in poetic beauty. It was edited by Lenz (Bonn, 1833) and translated into German by Höfer (Berlin, 1837), by Hirzel (1838), and by Lobedanz (Leipsic, 1861). The best edition is by Bollensen (Petersburg, 1845). There is also an English edition by Monier Williams, a metrical and prose version by the late Professor H. H. Wilson, and a literal prose translation by Professor E. B. Cowell (1851).

The third play, entitled *Málavikágnimitra*, has considerable poetical and dramatic merit, but is confessedly inferior to the other two. It possesses the advantage, however, that its hero Agnimitra and its heroine Málaviká are more ordinary and human characters than those of the other plays. It was edited by Dr. Tullberg at Bonn, 1840, and more correctly by Shankar P. Pandit, with English notes, in 1869, and ably translated into German by Professor Weber in 1856.

Two epic poems are also attributed to Kálidása. The longer of these is entitled *Raghuvança*, the subject of which is the same as that of the *Rámáyana*, viz., the history of Ráma, but beginning with a long account of his ancestors, the ancient rulers of Ayodhya (edited by Stenzler, London, 1832). The other epic is the *Kumárasambhava*, the theme of which is the birth of Kumára, otherwise called Kárttikeya or Skanda, god of war (edited by Stenzler, London, 1838, and by the Rev. K. M. Banerjea, 3d ed., Calcutta, 1872). Though containing many fine passages, it is tame as a whole.

His lyrical poems are the *Meghadúta* and the *Ritusamhára*. The *Meghadúta*, or the Cloud-Messenger, describes the complaint of an exiled lover, and the message he sends to his wife by a cloud. It is full of deep feeling, and abounds with fine descriptions of the beauties of nature. It was edited with free English translation by H. H. Wilson (Calcutta, 1813), and by Gildemeister (Bonn, 1841); a German adaptation by M. Müller appeared at Königsberg (1847), and one by Schmitz at Bielefeld (1859). It was edited by Johnson, with vocabulary and Wilson's metrical translation (London, 1867). The *Ritusamhára*, or Collection of the Seasons, is a short poem, of less importance, on the six seasons of the year. There is an edition by Bohlen, with prose Latin and metrical German translation (Leipsic, 1840).

Another poem, entitled the *Nalodaya*, or Rise of Nala, edited by Benary (Berlin, 1830) and by Yates (Calcutta, 1844), which is a treatment of the story of Nala and Damayanti, but describes especially the restoration of Nala to prosperity and power, has been ascribed to the celebrated Kálidása, but was probably written by another poet of the same name. It is full of most absurd verbal conceits and metrical extravagances.

So many poems, partly of a very different stamp, are attributed to Kálidása that it is scarcely possible to avoid the necessity of assuming the existence of more authors than one of that name. It is by no means improbable that there were three poets thus named; indeed modern native astronomers are so convinced of the existence of a triad of authors of this name that they apply the term Kálidása to designate the number three. (A. A. M.)

KALINGA, or CALINGA, one of the nine kingdoms of southern India in ancient times. Its exact limits varied, but included the eastern Madras coast, from Pulicat to Chicacole, running inland from the Bay of Bengal to the Eastern Ghâts. The name at one time had a wider and vaguer meaning, comprehending Orissa, and possibly extending to the Ganges valley. The Kalinga of Pliny certainly included Orissa, but latterly it seems to have been confined to the Telugu-speaking country; and in the time of Hwen Tsang (630 A. D.) it was distinguished on the south and west from Andhra, and on the north from Odra or Orissa, The language of the country is Telugu. Taranatha. the Tibetan historian, speaks of Kalinga as one division of the country of Telinga. Hwen Tsang speaks of Kalinga ("Kie-ling-kia") having its capital at what may now be identified with the site either of Rájámahendri (Rajahmundry) or Coringa. Both these towns, as well as Sinhapur, Kalingapatam, and Chicacole, share the honor of having been the chief cities of Kalinga at different periods.

KALINGAPATAM, or CALINGAPATAM, a town and port in Ganjám district, Madras, situated at the mouth of the Vamsadhára river, 18° 20′ 20″ N. lat., 84° 9′ 50″ E. long. Population (1871), 4676. It was the capital of the ancient Hindu kingdom of Kalinga, and one of the early seats of the Mahometan power in the Telugu country. Signs of its ancient greatness are still visible in the ruins of many mosques and other large buildings. The place is again rising in importance as a harbor, being the only safe roadstead along 400 miles of coast, and now a regular port of call for steamers. The value of the imports in 1875–76 was

£16,400; of the exports, chiefly rice, seeds, and sugar, £62,800. Kalingapatam yields a salt revenue to Government of from £40,000 to £50,000 a year.

KALISH (Polish, *Kalisz*), the chief town of a government of the same name in Russian Poland, is situated in 51° 46′ N. lat. and 17° 7′ E. long., 135 miles due west of Warsaw on the banks of the Prosna, which there forms the boundary of Prussia. It is one of the oldest and finest cities of Poland, is the seat of a Roman Catholic bishop, and possesses a castle, a gymnasium, a teachers' institute, a theatre, and a large public park. The industrial establishments comprise a brewery, cloth factories, a ribbon factory, and tanneries. In 1900 the population amounted to 21,680, of whom more than 8000 were Jews.

Kalish is identified with the Calisia of Ptolemy, and its antiquity is indicated by the abundance of coins and other objects of ancient art which have been discovered on the site, as well as by the numerous grave mounds existing in the neighborhood. In modern times it has been the scene of the decisive victory of Augustus the Strong over the Swedish general Mardefeld on 29th October, 1706, of several minor conflicts in 1813, and of the friendly meeting of the Russian and the Prussian troops in 1835, in memory of which an iron obelisk was erected in the town by Nicholas I. in 1841. The treaty of 1813 between Russia and Prussia is dated from Kalish.

KALITVENSKAYA, a stanitsa or camp-village in the country of the Don Cossacks, on the left bank of of the Donetz, 81 miles east of Novotcherkassk. The name is well known in southern Russia through the excellent building material obtained from the sandstone quarries of the neighborhood. The population increased from about 1500 in 1860 to 12,700 in 1872.

KÁLNÁ, or CULNA, a town in Bardwán district, Bengal, India, situated on the right bank of the Bhágirathí river 23° 13′ 20″ N. lat., 88° 24′ 30″ E. long. It is an important river-side market town, with an extensive trade. The population in 1872 amounted to 27,336,—22,463 of them Hindus.

KALOCSA, a town of Hungary, and capital of the former county of Solt (now included in the county of Pest-Pilis-Solt-Kis-Kun), is situated in a marshy but highly productive district, 3 miles distant from a steam-packet station on the left bank of the Danube, and about 69 miles south of Budapest, 46° 31′ N. lat., 18° 58′ E. long. Kalocsa is the see of the second of the four Roman Catholic archbishops of Hungary, and has a fine cathedral, a seminary for priests, a Roman Catholic (Jesuit) gymnasium, an observatory, and an archiepiscopal palace (formerly a fortress) containing a library of 80,000 volumes and a botanical collection. The inhabitants of Kalocsa and its wide-spreading communal lands are for the most part employed in the cultivation of the vine, fruit, flax, hemp, and cereals, in the capture of water-fowl, and in fishing. The population in 1900 was 13,380, chiefly Magyars by nationality and Roman Catholics by creed.

Kalocsa is one of the oldest towns in Hungary. The present archbishopric is a development of a bishopric said to have been founded in the year 1000 by King Stephen the Saint. The town was once well fortified, and of far greater relative importance than at present. It suffered much during the 16th century from the desolating hordes of Ottomans who then ravaged the country. Kalocsa is much resorted to as an ecclesiastical centre.

KÁLPI, or CULPEE, a town in Jaláun district, North-Western Provinces, India, situated on the right bank of the Jumna, 26° 7′ 30″ N. lat., 79° 47′ 15″ E. long. Population (1872), 15,570, viz., 11,414 Hindus and 4156 Mahometans. It was founded, according to tradition, by Básdeo or Vasudeva, who ruled at Kámbai from 330 to 400 A.D. In 1196 it fell to Kutb-ud-dín, the viceroy of Muhammad Ghorí, and during the subsequent Mahometan period it played a large part in the annals of this part of India. About the middle of the last century it fell into the hands of the Marhattás. It was captured by the British in the campaign of 1803, and since 1806 has remained in British possession. In May, 1858, Sir Hugh Rose (Lord Strathnairn) defeated there a large force of about 10,000 rebels under the rání of Jhánsí. Kálpi was formerly a place of far greater importance than at present. It had a mint for copper coinage in the reign of Akbar; and the East India Company made it one of their principal stations for providing the "commercial investment." A bridge of boats on the Jhánsí and Cawnpur road crosses the river during the summer months. Cotton and grain are exported to Cawnpur, Mírzápur, and Calcutta; and paper and sugar candy are manufactured.

KALUGA, a central government of European Russia, surrounded by those of Moscow, Smolensk, Orel (Orloff), and Tula. The area is estimated at 25,594 square miles, or according to the maps of the Kaluga surveying office 27,407. For the most part the surface is flat, and the culminating point of the government is a hill in the northern district of Meduin, 910 feet in height. In the northwest there is a considerable tract of peat-bog. The Oka, a main tributary of the Volga, and its confluents (the Zhizdra, the Ugra, etc.), drain all but a strip of country in the west, which is traversed by the Bolva, an affluent of the Dnieper. Strata of Carboniferous Limestone prevail except in the north, where Jurassic rocks take their place. The coal though common enough is of poor quality, and has been comparatively little worked. Clays from the southern districts are employed in the glass-works of Kaluga and the surrounding governments. Iron-ore is obtained in considerable abundance between the left-hand feeders of the Bolva and the upper course of the Zhizdra. According to the reports of the statistical committee for 1880 (*Pamyatnaya Knizhka*, 1881) about 1,246,874 acres were covered with forest (pines, firs, birches), large tracts more especially existing in the Zhizdra district; 20,000 acres consisted of marsh land, 903,580 acres were under tillage, and 2,201,208 were devoted to pasturage. The soil in most parts of the government is composed of sand or clay; and it is only in certain portions of the districts of Peremuishl, Kozelsk, and Meshtchovsk that the famous "black earth" is found. Agriculture is in a comparatively low state in Kaluga, requiring a great increase in the outlay of capital, and especially the keeping of more live stock for the fattening of the soil.

Rye and oats are the principal crops, but the production is less than the local demand. Buckwheat, potatoes, flax, and hemp are also grown. Manufacturing industries are on the increase, the cloth and cotton factories employing upwards of 2000 men, the iron-works more than 6000, the paper-mills about 1300, and the match-works more than 1500. The breeding of canaries, which are sent to all parts of Russia, was a source of livelihood to 350 persons in 1880. Railway lines from Moscow to Orel, from Moscow to Smolensk, and from Smolensk to Orel enclose the government in a triangle, but none of them touch its territory. By means, however, of the navigable streams, a good deal of traffic is carried on. The government is divided into eleven districts (*uyezd*):—Kaluga, Mosalsk, Meshtchovsk, Likhvin, Kozelsk, Zhizdra, Peremuishl, Meduin, Borovsk, Maloyaroslavets, and Tarusa. The following are the towns of more than 5000 inhabitants, according to the returns for 1870:—Kaluga, 38,600; Zhizdra, 11,700; Borovsk, 9500; Meduin, 7800; Kozelsk, 7350; Sukhinitchi, 6050; Meshtchovsk, 5450; Maloyaroslavets, 5150. The government had a population of 1,287,300 in 1906.

KALUGA, the chief town of the above government, is situated 475 feet above the sea-level on the left bank of the Oka, at the confluence of the Yatchenka, 114 miles southwest of Moscow, in 54° 31′ N. lat. and 36° 6′ E. long. Among the public buildings may be mentioned the cathedral of the Trinity (rebuilt in the present century in room of an older edifice dating from 1687), two monastic establishments, a male and a female gymnasium, an ecclesiastical seminary (with 219 students in 1879), an infant asylum, an orphanage, a public hospital, a lunatic asylum, a hospital for incurables, and a house of correction. The principal articles of production are leather, oil, bast mats, wax candles,

starch, and a particular kind of cake known in Russia by the name of the town. This last item alone counts for more than 1,000,000 roubles (£156,000) per annum in the local trade. Situated as it is on a navigable river, and at the junction of important roads, Kaluga is naturally the centre of no small commercial activity. Even in the beginning of the century its merchants and manufactures were known in Leipsic, Bremen, and Dantzic. Including the suburban villages of Yamskaya and Podsavalya the town had 49,513 inhabitants in 1900.

The first historical mention of Kaluga occurs in 1389, when Demetrius of the Don assigned it to his son; and its final incorporation with the principality of Moscow belongs to the year 1518. In 1607 it was held by the pretender Bolotnikoff, and vainly besieged for four months by the forces of Shuiski; but in 1619 it fell into the hands of the Zaporogian hetman. Nor was it from war alone that Kaluga suffered. Two-thirds of its inhabitants were carried off by a plague; and in 1622 the whole place was laid waste by a conflagration. It recovered, however, and, in spite of several extensive conflagrations (especially in 1742 and 1754) has continued to flourish. The rank of chief town of a province was obtained in 1719. In 1734 the population numbered 13,788, and by 1785 had increased to 17,078. On several occasions Kaluga has been chosen as the residence of political prisoners; among others, the famous Schamyl (see *Russkaya Starina*, 1877) spent his exile there.

KALVARIYA (*i.e.*, Calvary), a district town in the government of Suvalki in Russian Poland, on the right bank of the Shelupa, 40 miles southwest of Kovno. It carries on a considerable trade, and manufactures needles, linen, flannel, leather, and combs. The inhabitants, of whom more than two-thirds are Jews, amounted to 9400 in 1867, and to 8,420 in 1897.

KALW, or CALW, chief town of a circle in the government district of Schwarzwald, Würtemberg, is situated on the Nagold, about 34 miles southwest of Stuttgart by rail. It is the seat of local, civil, and criminal courts, and of a chamber of commerce; and it contains a high school, a commercial gymnasium, and a missionary institution. The industries include a large variety of spinning and weaving operations in wool and cotton. Carpets, cigars, and wool-combs are also manufactured. The timber trade, chiefly carried on with the Netherlands, is important. The prevalence of malaria renders the valley of the Nagold unhealthy. The population in 1905 was 5,196.

The name of Kalw emerges as early as 1037. In the Middle Ages the town was under the dominion of an ancient and powerful family of counts, whose possessions finally passed to Würtemberg in 1345. In 1634 the town was taken by the Bavarians, and in 1692 by the French.

KÁMALÁ, a red powder used in medicine as an anthelminthic. It is obtained from *Mallotus Philippinensis*, Müll., a large shrub or small tree from 20 to 45 feet in height, widely distributed in Asia, from southern Arabia in the west to North Australia and the Philippines in the east. The fruit of this species, as of many other Euphorbiaceous plants, is covered with stellate hairs, among which are intermixed ruby-colored glands. These are found also on other parts of the plant, especially among the down with which the under surface of the leaf is covered. Kámalá is collected in many parts of India, and forms one of the lesser products of the Government forests in the Madras presidency at Naini Tal, where the *Mallotus* is found growing in immense quantities at the foot of the hills. According to Mr. F. E. G. Matthews, numbers of people, chiefly women and children, are engaged in collecting the powder for exportation. A quantity of the berries is thrown into a large basket and rubbed with the hand until the powder is removed and falls through the basket, as through a sieve, on a cloth spread below it to receive it.

The collection of kámalá begins in March, and lasts for about a month. The drug thus prepared contains, besides the glands, stellate hairs and fragments of leaves. Some samples, however, are occasionally met with in commerce containing as much as 60 per cent. of earthy matter, which is easily detected by its sinking when the kámalá is stirred up with water, or by the amount of ash left when the powder is incinerated. In India kámalá has long been known, since it has several ancient Sanskrit names, one of which kapila, signifies dusky or tawny red. Under the name of wars, kanbil, or qinbil, kámalá appears to have been known to the Arabian physicians as a remedy for tapeworm and skin diseases as early as the 10th century, and indeed is mentioned by Paulus Ægineta in the 7th, but it did not attract any special attention in Europe as a medicine until experimented with by Mackinnon, a surgeon in the Bengal medical establishment, who tried it in numerous cases of tapeworm. Anderson and others in India, and Leared in London, confirmed the results obtained, and established the fact that kámalá is an efficient tænifuge. It was soon after introduced into the British pharmacopœia (1864).

Kámalá floats on water, which scarcely acts on it even at a boiling heat, but it yields about 80 per cent. of a splendid red resin to alcohol, ether, chloroform, benzol, glacial acetic acid and bisulphide of carbon. When sprinkled over a flame it ignites with a flash like lycopodium, and yields after incineration about 1.7 per cent. of ash. Leube found that the resin consisted of two varieties, one more easily soluble, and fusing at 176° Fahr. (80° C.), and the other dissolving less readily, fusing at 375.8° Fahr. (191° C.). Anderson obtained a substance, named by him rottlerin, $C_{22}H_{20}O_6$, by allowing a strong etherial solution of kámalá to stand for a few days. This when purified by recrystallization formed satiny minute tabular yellow crystals soluble in ether, sparingly soluble in cold and more so in hot alcohol, and insoluble in water.

Another kind of kámalá under the Arabic name of wars is sometimes exported from Aden, where it is shipped from Harar on the east coast of Africa, and is also collected in southern Arabia and exported thence to the Persian Gulf and Bombay. The plant from which this variety is obtained is not known. It differs from true kámalá in having a deep purple color, in the greater coarseness of its particles, in yielding 12 per cent. of ash, in having long simple hairs mixed with it, and in becoming quite black when heated to from 199.4° Fahr. (93° C.) to 212° Fahr. (100° C.), at which temperature true kámalá undergoes no change. The microscopic structure of the glands is also different, the resin cells being oblong instead of club-shaped, and the grains themselves cylindrical or subconical instead of irregularly spherical. It is to this variety of kámalá that the name wars alone belongs, while kámalá, kanbil, and qinbil are restricted to the red powder collected in India. In 1875–76 there were exported from Aden 42,975 lb of wars. Dr. Vaughan when residing in Aden in 1852 observed that under the name of wars kámalá was also used as a dyestuff for silk (*Pharmacographia*, p. 373).

KAMCHATKA, or KAMTCHATKA, a peninsular portion of eastern Siberia, Russia, stretching south between the sea of Okhotsk on the west and Behring's Sea on the east, and finding its physical continuation first in the Kurile Islands (of which Shunshu is only 7 miles distant from the terminal Cape Lopatka) and then in the larger islands of the empire of Japan. The area is estimated at 237,266 square miles. The range of mountains which form the backbone of the peninsula opens up towards the middle into two distinct branches, and gives the whole the general outline of an oval leaf. The western branch is the higher of the two. Southwards from 57° N. lat. there are no fewer than twelve active and twenty-six extinct craters,—all, however, except five on the eastern side of the peninsula. The active volca-

noes are as follows:—Klyutchevskaya Sopka (15,040 feet in height), Shevelyutch (9898 feet), Bolshaya (*i. e.*, the Great) Tolbatcha (7800 feet), Kizimen, Uzon, Kishpinitch, the Great and the Little Semetchik, Zhupanova Sopka (8496 feet), Avatchinskaya (8360 feet), Asatcha, and Tchaokhtch. The eruptions of Klyutchevskaya are not unworthy of being compared with those of Mount Etna; the most notable chronicled by European observers are those of 1727–1731 (lasting four years), 1737, and 1854. More than twenty hot springs are known. The basis rocks are granite and porphyry, with metamorphieschists, basalts, trachytes, and other volcanic rocks. The sedimentary rocks are mainly of Tertiary and more particularly Eocene origin; those of the Quaternary period have a limited area. Native copper, magnetic iron, lignite, amber, mica, and sulphur are the chief minerals. Of the rivers the largest bears the same name as the peninsula; rising in the highest part of the central range, it flows north

Map of Kamchatka.

for about 310 miles, and falls into the Behring Sea. The valley of the Kamchatka forms the most fertile and most populous portion of the peninsula. For the meteorology of this portion of Asia the materials are of the scantiest; Dr. Wild even (*Met. Repertorium*, suppl. vol., St. Petersb., 1881) is obliged to have recourse to observations as far back as 1844. In January the mean temperature appears to be 19.4° Fahr. at the southern point of the peninsula, 17.6° at Petropavlovsk, and −5.8° at the northern extremity. The western coast is very considerably colder in winter than the east, but the snowfall is much heavier in the east than in the west. Towards the south especially snow often lies so thick that the natives cannot keep reindeer. During summer the weather is very uncertain, with frequent rains and fogs; but in the centre of the peninsula especially there is a large amount of warmth. Vegetation, especially on soils of volcanic origin, is remarkably luxuriant; the grass grows nearly 5 feet high, and may be cut three times. In the woods berries, mushrooms, and the Martagon lily abound, the bulbs of the last also furnishing food to the natives. Beyond the forests appear *Rhododendron Kamtschaticum*, *Salix arctica*, and other plants of an alpine type. The Kamchatkan nettle—with richly variegated foliage—is a familiar object in English greenhouses. Besides the Kamchadales proper there are Koryak and Lamut tribes within the limits of the peninsula. By themselves the Kamchadales are called Itelm,—the name by which they are usually known being a corruption of Konchal, their Koryak appellation. There are not in all more than 2000 Kamchadales, and the process of Russification is going on rapidly. They are a strong hardy people, inured to the severities of the climate, capable of any amount of toil in the way of walking. To their women they are affectionate, and even submissive. In winter they live in pits covered in with earth and turf, the interior being reached by means of a ladder. In the summer they occupy slight wooden sheds (*bologans*) raised on high props or stilts. The skill they display in the training of their sledge-dogs is not surpassed by any other people who practice the same art. With their sledges (narts)—which measure from 5 to 10 feet in length—they travel 4 to 8 miles an hour. The Kamchadale language cannot be assigned to any known group; its vocabulary is extremely poor. The purity of the tongue is best preserved by the people of the Penzhinsk district on the west coast; many of the inhabitants of the Kamchatka valley speak a broken Russian. Mr. Kennan compares the sound of the language to that of water running out of a narrow-mouthed jug. The total population of the peninsula were 7331 in 1853, and 5846 in 1870.

The Russians made their first settlements in Kamchatka in the end of the 17th century; in 1696 Vladimir Atlasoff from Anaduirsk founded Nizhne-Kamchatsk, and in 1704 Kobeleff founded Bolsheretsk. About twelve years later the Russians came for the first time by sea from Okhotsk. In 1720 a survey of the peninsula was undertaken; in 1725–30 it was visited by Behring's expedition; and from 1733–45 it was the scene of the labors of the Krasheninnikoff and Steller expedition. Disturbance among the natives in 1731 led to the building of a fort at Tigilsk. The seat of the government is at Petropavlovsk. In 1855 the country was incorporated with the Maritime Province.

See Krasheninnikoff, *Opisanie Kamchatki*, 1786, of which an English translation appeared at Gloucester, 1764, and a German translation at Leipsic, 1774; Lesseps, *Reise durch Kamtschatka*, Berlin, 1791; Erman, *Reise*, vol. iii.; Langsdorff, *Bemerk. auf einer Reise um die Welt*, 1812; Tronson, *Voyage to Japan*, etc., London, 1859; Petermann's *Mittheilungen*, 1860; *Revue d'Anthropologie*, 1872; Kennan, *Tent Life in Siberia*, New York, 1870; and the same author's paper in *Journ. of Amer. Geogr. Soc.*, 1876.

KAMENETS (Polish, *Kamieniec*), usually distinguished as Podolian Kamenets to distinguish it from Lithuanian Kamenets in Grodno, is the chief town of the government of Podolia, Russia. It is situated in 48° 40′ N. lat. and 26° 25′ E. long., 982 miles south of St. Petersburg, and occupies a high and rocky peninsula formed by the river Smotritch, a left-hand tributary of the Dniester. Round about the town lie quite a cluster of suburban villages, the Polish Folwark, the Russian Folwark, Zinkovtsui, Karvasarui, etc.; and on the opposite side of the river, and accessible by a

wooden bridge, stands the fine old castle which so long frowned defiance across the Dniester to Khotin. Among the ecclesiastical buildings may be mentioned the Roman Catholic cathedral of St. Peter and St. Paul, built in 1361, and distinguished by a minaret, which recalls the time when it was used as a mosque by the Turks; the Greek cathedral of John the Baptist, dating from the 16th century, but up to 1798 belonging to the Basilian monastery; the Orthodox monastery of the Trinity; the Catholic Armenian church, founded in 1398, and possessing among its treasures a missal of slightly earlier date and an image of the Virgin Mary that saw the Tartar invasion. The town contains further a Government gymnasium, Orthodox and Roman Catholic seminaries, Jewish colleges, and an infirmary. The population was 20,699 (11,091 males) in 1863, comprising 9965 Jews, 4987 Catholics, 69 Armenians, and 56 Protestants. In 1870 the total was 22,611.

Kamenets appears to be first mentioned in the Russian chroniclers in the end of the 12th century, though there is some doubt whether it be the Podolian town that is meant. Laid waste in 1240 by the forces of Baty, the leader of the Golden Horde, it passes out of view for nearly a century. It afterwards appears frequently in the general history of the Podolian region; and in 1434 it was made the chief town of the province of Podolia, instituted by Ladislaus III., king of Poland. In the course of the 15th and 16th centuries it suffered frequently from the invasions of Tartars, Moldavians, and Turks; and in 1672 the hetman Doroshenko, assisted by Mahomet IV., made himself master of the place. Restored to Poland by the peace of Carlowitz (1699), it passed with Podolia to Russia in 1795, and on the constitution of the Podolian government in the following year obtained the rank of government town.

KAMENZ, chief town of a department in the circle of Bautzen, Saxony, is situated on the Black Elster, about 21 miles northeast of Dresden. It is the seat of a local court, and has a handsome new town-house and a library. The hospital is dedicated to the memory of Lessing, who was born here in 1729. A colossal bust of the poet was placed opposite the Wend church in 1863; and a monument was raised to him on a neighboring hill in 1864. The industries of Kamenz include wool-spinning, and the manufacture of cloth, crockery, and stoneware. In 1905 the inhabitants numbered 11,120, including the garrison.

Till the 16th century Kamenz was known by the name Dreikretcham. In 1318 it passed by purchase to the margrave of Brandenburg; in 1319 it went to the king of Bohemia; and in 1635, after suffering much in the Hussite and Thirty Years' wars, it came into the possession of Saxony. In 1706 and 1842 it was visited by conflagration. About 6 miles southeast is the Cistercian monastery of Marienstern.

KAMES, Henry Home, Lord (1696–1782), a philosopher and Scotch judge, was descended from an old Scotch family, and was the son of George Home of Kames, in the county of Berwick, where he was born in 1696. After receiving a somewhat imperfect education from a private tutor, he was in 1712 bound by indenture to a writer to the signet in Edinburgh, but an accidental introduction to the comfortable and dignified leisure of Sir Hew Dalrymple, then president of the court of session, determined him to aspire to the higher position of advocate. He accordingly set himself with great diligence to remedy the defects of his early education, studying in private the various branches of literature and science which constituted the curriculum of arts in the Scottish universities, and with special interest those of metaphysics and moral philosophy. He was called to the bar in 1723, and, as he was unpossessed of those brilliant qualities which sometimes command immediate success, he employed his leisure in the compilation of a volume which he published in 1728 under the title *Remarkable Decisions in the Court of Session from* 1716 *to* 1728. This work having attracted attention to his abilities, his power of ingenious reasoning and mastery of law gradually gained him a leading position at the bar. His professional duties did not, however, prevent him devoting a large portion of his time to special studies, as well as to philosophy and literature, while his flow of animal spirits, his affectionate disposition, and his conversational gifts rendered him very partial to social intercourse, especially with persons of cultivated tastes. In 1752 he was appointed a judge in the court of session under the title of Lord Kames, and in 1763 he was made one of the lords of justiciary. Through his wife, Agatha Drummond, whom he married in 1741, he in 1761 succeeded to the estate of Blair-Drummond, Perthshire, where he put into practice a remarkably bold scheme of agricultural improvement, the removal of a stratum of peat on 1500 acres of land by floating it into the river Forth. He died at Edinburgh, 27th December, 1782.

Whatever opinion may be formed of the literary qualities, the originality, or the intrinsic value of the publications of Lord Kames, there can be no question as to the versatility of taste and incessant diligence which they imply. The extent and thoroughness of his legal knowledge is attested by a large number of separate works: *Jus Tertii*, etc., 1732; *Dictionary of Decisions*, 1741; *Essays concerning British Antiquities*, 1747; *Principles of the Law of Scotland*, 1754; *Statute Law of Scotland abridged*, 1757; *Historical Law Tracts*, 1758; *Principles of Equity*, 1760; a second volume of *Remarkable Decisions*, 1766; *Elucidations concerning the Commercial and Statute Law of Scotland*, 1770; and *Selected Decisions of the Court of Session*, 1780. Lord Kames also took a special interest in the agricultural and commercial affairs of the country. In 1755 he was appointed a member of the board of trustees for encouragement of the fisheries, arts, and manufactures of Scotland, and about the same time he was named one of the commissioners for the management of the forfeited estates annexed to the crown. One of his favorite amusements was the embellishment of his estate, in connection with which he carried into execution a novel plan of a winter garden. On the subject of agriculture he wrote *The Gentleman Farmer*, 1776. In 1765 he published a small pamphlet *On the Flax Husbandry of Scotland;* and, besides availing himself of his extensive acquaintance with the proprietors of Scotland to recommend the introduction of manufactures, he took a prominent part in furthering the project of the Forth and Clyde Canal. He was also one of the founders of the Physical and Literary Society, afterwards the Royal Society of Edinburgh. It is, however, as a writer on philosophy that Lord Kames is best known. In 1751 he published his *Essays on the Principles of Morality and Natural Religion*, in which he endeavored to maintain the doctrine of innate ideas, but conceded to man an apparent but only apparent freedom of the will. His statement of the latter doctrine so aroused the alarm of certain clergymen of the Church of Scotland that he found it necessary to withdraw what was regarded as a serious error, and to attribute man's delusive sense of freedom, not to an innate conviction implanted by God, but to the influence of the passions. *An Introduction to the Art of Thinking*, which appeared in 1761, was followed in 1762 by *Elements of Criticism*, an ingenious, and, in some respects, suggestive discussion of the principles of taste, but in many ways imperfect and unsatisfactory. In 1774 he published, in two volumes, *Sketches of the History of Man*, a somewhat heterogeneous medley of opinions and speculations on a great variety of subjects, but containing many shrewd suggestions and much curious observation. The works of Kames as a whole are more remarkable for superficial fertility and varied learning than for real originality, and his reasoning is clever and ingenious rather than subtle and comprehensive. His style is loose, frequently incorrect, and awkward in construction, and abounds in expressions which border on slang.

See *Life of Lord Kames*, by A. F. Tytler, Lord Woodhouselee, in 2 vols., 1807.

KAMMIN, or Cammin, the chief town of a circle in the government district of Stettin, Prussia, is situated 2½ miles from the Baltic coast, on the Kamminsche Bodden, a lake connected with the sea by the Dievenow. It is the seat of a local court. The venerable cathedral and the church of St. Mary are noteworthy. Portland cement and knitted goods are produced in the town, which has also some fishing and shipping industry. There is daily steamer communication with Stettin, about 40 miles south-southwest. Kammin is of Wendish origin. From 1175 till 1628

it was the seat of a bishopric, which at the latter date became a secular principality, afterwards incorporated with Brandenburg. Population in 1905, 5,923.

KAMPEN, a town of Holland, in the province of Overyssel, stretches for nearly a mile along the left bank of the Yssel, about 3¾ miles above the mouth of the river. It is connected by railway with Zwolle. The town is traversed in its whole length by a canal, and the old walls have been transformed into promenades and drives. Three of the town gates are good examples of the style of such architecture in the 16th and 17th centuries. Of the seven churches the most noteworthy is St. Nicholas, which ranks with the cathedral of Utrecht and St. John's of Bois-le-Duc as one of the three great mediæval churches in the Netherlands. The town-hall, dating partly from the 16th century and partly from the 18th, is of interest both from its architecture and decorations, and for the value of the archives. There are a theological seminary, a gymnasium, an upper burgher school, and a municipal school of design; among the beneficent foundations the most notable is the Great Orphanage. The pasture land of the vicinity fosters a considerable trade in dairy produce; and there are ship-yards, rope-walks, a tool factory, cigar factories, paper mills, etc. The inhabitants numbered 7760 in 1840, 11,903 in 1870, and 19,664 in 1900.

Kampen (variously Latinized as *Campæ, Campi,* and *Campania ad Isalam*) appears as early as 1172, and soon acquired municipal rights. In the 14th century it was the seat of a flourishing cloth manufacture, and as a member of the Hanseatic League it developed a large trade with Denmark and various parts of the Low Countries and Germany. The town was vainly besieged by Duke John of Bavaria in 1400, and by Jan van Ens in 1493. During the great wars of the 16th century it was occupied by the forces of the States in August, 1572, a little later captured by Don Frederick, recovered for the States by Rennenberg in 1578, and attacked without success by Verdugo in 1584. The Münster party obtained possession of Kampen in 1672, but were expelled by the French in 1673.

Kampen is to the Dutch what Gotham is traditionally to the English, or Schilda and Schöppenstadt to the Germans. See E. Moulin, *Histor. Kamper Kronijk;* Havard, *Cities of the Zuyder Zee,* 1876.

KAMPTULICON. See FLOOR CLOTH.

KÁMRÚP, a district of Assam, India, extending along both banks of the Brahmaputra, between 25° 50′ and 26° 53′ N. lat. and 90° 40′ and 92° 2′ E. long., bounded on the N. by Bhután state, on the E. by Darrang and Nowgong districts, on the S. by the Khási hills, and on the W. by Goálpárá district.

The general physical characteristics of Kámrúp are those common to the whole valley of Assam. In the immediate neighborhood of the Brahmaputra the land is low, and exposed to annual inundation. In this marshy tract reeds and canes flourish luxuriantly, and the only cultivation is that of rice. At a comparatively short distance from the river banks, the ground begins to rise in undulating knolls towards the mountains of Bhután on the north, and towards the Khási territory on the south. The hills south of the Brahmaputra in some parts reach the height of 800 feet. It is on the slopes of these hills, amid the primeval jungle, that European planters have set out their trim tea-gardens. The general scenery of Kámrúp is thus agreeably diversified; and the villages are described as very picturesque. The Brahmaputra, which divides the district into two nearly equal portions, is navigable by river steamers and large cargo boats throughout the year, and receives several tributaries navigable by large native boats in the rainy season. The chief of these are the Manás, Chául Khoyá, and Barnadi on the north, and the Kulsi and Dibru on the south bank. Forests cover about 130 square miles of the district, of which 49 square miles have been reserved by the forest department. There is also a plantation reserve, where seedlings of teak, *sál, sissu, súm,* and *nahor* are reared, and experiments are being made with the caoutchouc tree.

The census of 1871 returned a population of 561,781 (292,688 males and 268,993 females), spread over an area of 3631 square miles. Hindus numbered 514,024; Mahometans, 45,823; Buddhists, 182; Christians, 204, of whom 120 are natives; and "others" 448. Kámrúp is the headquarters of a sect of Vishnuvites, known as Mahápurúshiás, who are described as extremely bigoted. The Mahometans are supposed to be the descendants of the early invaders. The native Christian community is under the charge of the American Baptist Mission, which has a station at Gauhátí town. The population is entirely rural, the only town with upwards of 5000 inhabitants being Gauhátí, with 11,492. The temples of Hajo and Kamákhya attract many pilgrims from all quarters.

The staple crop of the district is rice, of which there are three crops. The state is the landlord, and the land settlement is made directly with the cultivators. The condition of the cultivators is high, and it is found difficult to obtain laborers for ordinary work. The indigenous manufacturers are confined to the weaving of silk and cotton cloths for home use, and to the making of brass cups and plates. The cultivation and manufacture of tea are conducted almost solely by European capital. In 1874 there were twenty-four plantations, with 2638 acres under tea, the out-turn being 375,634 lb. The chief exports are rice, oilseeds, timber, and cotton; the imports are fine rice, salt, piece goods, sugar, betel nuts, cocoa nuts, and hardware. Education in 1872 was afforded by 146 schools, attended by 3969 pupils, including a high school and college in Gunhátí town. The mean temperature is 76°, and the average annual rainfall 70.12 inches.

KAMTHÍ, or KAMPTEE, a large town and cantonment in Nágpur district, Central Provinces, India, 21° 13′ 30″ N. lat., 79° 14′ 30″ E. long. Population (1877), 48,831. Considerable trade is carried on here in cattle, country cloth, salt, European piece goods, and timber. The town contains a large market-place, a dispensary, schools, travellers' rest-houses, a Protestant and a Roman Catholic church, five Mahometan mosques, and seventy Hindu temples. An extensive parade ground separates the cantonment from the town, which is built in broad and regular streets.

KAMUISHIN, or KAMYSHIN, a town of Russia, in the Saratoff government, on the right bank of the Volga, 120 miles south-southwest of Saratoff, on the highway to Astrakhan. The inhabitants carry on a good river-trade in wood, tar, grain, fish, tallow, and garden produce,—the Kamuishin melons especially being sent to various parts of Russia, and forming the raw material for a kind of syrup (*nardek*) manufactured in the town. The population in 1861 was 8644; the St. Petersburg calendar for 1873 gives the number as 15,698. Population 15,934 in 1900.

Kamuishin, it is said, was founded in 1668 on the left bank of the Kamuishinka, for the suppression of the brigandage carried on in the district. Peter I., intending to make a canal from the stream to the Ilovyla, erected a fort on its right bank; and in 1710 the inhabitants of the older settlement removed to the same side, and the town took the name of Dmitrievsk. The present name dates from 1780, when the place became the chief town of a district.

KANANÚR, or CANNANORE, a town, seaport, and cantonment in Malabar district, Madras, India, 11° 51′ 12″ N. lat., 75° 24′ 44″ E. long., with a population in 1871 of 10,265. The sea-borne trade in 1875–76 amounted to £220,244 value of imports, and £115,248 of exports. Anglican, German, and Roman Catholic missions are established in the town. Kananúr belonged to the Kalahasti or Cherakal rájás till the invasion of Malabar by Hyder Ali. In 1498 a Portuguese colony was planted there by Cabral, and seven years later a factory was established by Vasco da Gama. In 1656 the Dutch effected a settlement and built the present fort, which fell into the hands of the Mysore troops in 1766. In 1784 Kananúr was captured by the British, and the reigning princess became tributary to the East India Company. From 1791 it has been the principal British military station on the Malabar coast.

KÁNARA, or CANARA, NORTH, the most southerly of the coast districts of Bombay, India, lying between 13° 52′ and 15° 31′ N. lat., and between 74° 10′ and

75° 7′ E. long., bounded on the N. by Belgaum, E. by Dhárwár and Mysore, S. by South Kánara, W. by the Arabian sea and N.W. by the Portuguese territory of Goa, with an area of 4235 square miles. The chief town is Kárwár. The main feature in the physical geography of the district is the Sahyádri range of the Western Ghâts, which, running from north to south, divides it into two parts, a lowland or coast strip (Payanghât), and an upland plateau (Bálághât). The coast-line is only broken by the Kárwár headland in the north, and by the estuaries of four rivers and the mouths of many smaller streams, through which the salt water finds an entrance into numerous lagoons winding several miles inland. The breadth of the lowlands varies from 5 to 15 miles. From this narrow belt rise a few smooth, flat-backed hills, from 200 to 300 feet high; and at places it is crossed by lofty, rugged, densely wooded spurs, which, starting from the main range of the Sahyádri hills, maintain almost to the coast a height of not less than 1000 feet. Among these hills lie well-tilled valleys of garden and rice land. The plateau of the Bálághât is irregular, varying from 1500 to 2000 feet in height. In some parts the country rises into well-wooded knolls, in others it is studded by small, isolated, steep hills. Except on the banks of streams and in the more open glades, the whole is one broad waste of woodland and forest. The open spaces are dotted with hamlets or parcelled out into rice clearings.

Of the rivers flowing eastward from the watershed of the Sahyádri hills the only one of importance is the Wardha, a tributary of the Tungabhadra. Of those that flow westwards, the four principal ones, proceeding from north to south, are the Káli, Gungawáli, Tadri, and Sharavati. The last of these, plunging over a cliff 825 feet in height, about 35 miles from Honáwar town, forms the famous Gersoppa falls. The mineral products of the district consist of iron, limestone, and building stone. Extensive forests clothe the Sahyádri hills, and are conserved under the rules of the forest department. During the ten years 1866–76 they yielded an average annual revenue of £39,307 to the state. Tigers, leopards, bears, deer, and wild hogs are numerous, and small game is plentiful. North Kánara formed part of Madras till 1861, when it was transferred to Bombay presidency.

The census of 1872 returned a population of 398,406 (206,417 males and 191,989 females), 94 to the square mile. The Hindus numbered 364,402; Mahometans, 21,755; Pársís, 25; Christians, 12,189; and Jews, 34. The most noteworthy class among the Hindus are the Havik Bráhmans, who make their livelihood from spice and areca nut gardens. Besides the regular Mahometan population (descendants from Hindu converts to Islám), there are two special classes of foreign Mahometans,—the Navâyâtas or seamen, representatives of early colonies of Arab merchants, and the Sidis or descendants of African slaves formerly owned by the Portuguese. The Christians are nearly all Roman Catholics, a few families of whom are of Portuguese extraction, though much mixed by intermarriage with the natives; the remainder consist of local converts or their descendants.

The area under cultivation is returned at 333,175 acres, or about 12 per cent. of the total area. Rice forms the staple crop, but *rágí*, sugar-cane, and safflower are also grown to a considerable extent; and cocoa-nuts, areca-nuts, cardamoms, and pepper are produced in gardens in large quantities for home consumption and for export. Cochineal is largely exported. Coffee is grown only to a small extent. Kárwár, Kumpta, Ankola, Bhatkal, and Honáwar are the most important seaports. The total value of the trade at these in 1876 was £1,841,173, viz., £1,199,077 exports and £642,096 imports. Carving in sandalwood and ebony forms an important industrial art. Salt is largely manufactured under Government supervision. The total revenue of the district in 1876–77 was £165,597, of which the land tax yielded £82,862, and forests £34,281. There were, in 1875–76, 83 schools, attended by 4425 pupils. Fever of a severe type is the prevalent disease, and occasionally rages in an epidemic form. The average annual rainfall on the coast varies from 100 inches at Kárwár to 163 at Kumpta; in the uplands it averages about 72 inches.

KÁNARA, or CANARA, SOUTH, a district on the western coast of the Madras presidency, India, bounded on the north by North Kánara (Bombay), E. by Mysore and Coorg, S. by Malabar, and W. by the Indian Ocean, with an area of 3902 square miles. The chief town is Mangalore. The district is intersected with rivers, none of which exceed 100 miles in length. They all take their rise in the Western Ghâts, and many of them are navigable for boat traffic during the fair weather for from 15 to 25 miles from the coast. The chief of these streams are the Netravati, Gúrpur, and Chendragiri. The general scenery of the district is varied and picturesque. Abundant vegetation, extensive forests, and numerous groves of cocoa-nut palms extend along the coast, and green rice-fields are seen in every valley. The Western Ghâts, rising to a height of from 3000 to 6000 feet, fringe the eastern boundary of the district. Forest land of great extent and value exists, but most of it is private property. Jungle products (besides timber) consist of bamboo, cardamoms, wild arrowroot, gall-nuts, gamboge, catechu, fibrous bark, cinnamon, gums, resin, dyes, honey, and beeswax. The forests formerly abounded in game, which, however, is now rapidly decreasing under incessant shooting.

The census of 1871 returned a population of 919,513 (235 to the square mile), of whom 787,183 were Hindus, 82,803 Mahometans, 49,517 Christians, and 10 "others." The only towns with a population exceeding 2000 are Mulki, Udipi, Kárikal, Bantwal, and Mangalore. The staple crop is rice. Cocoa-nut gardens are numerous along the coast, and areca plantations in the interior. Gram, beans, hemp, *rágí*, sugarcane, tobacco, and cotton are also grown, but not to any great extent. The chief articles of import consist of piece goods, cotton twist, yarn, oils, and salt. The total value of imports in 1875–76 was £183,250, and the value of the exports £781,672, of which £400,000 represented coffee and £175,000 rice. The total revenue of the district in 1870–71 was £233,776, of which £116,189 was made up by land tax. Education was afforded in 1871 by 103 Government and inspected schools, attended by 4007 pupils.

KANAUJ, an ancient city in Farrukhabad district, Northwestern Provinces, India, 27° 2′ 30″ N. lat., 79° 58′ E. long., with a population in 1872 of 17,093, viz., 10,864 Hindus and 6229 Mahometans. Kanauj in early times formed the capital of a great Aryan kingdom, and the Gupta dynasty extended their sway over a large portion of Upper India. The prosperity of the city dates from a prehistoric period, and seems to have culminated about the 6th century. In 1018 it fell before Mahmúd of Ghazní, and again in 1194 before Muhammad Ghori. The existing ruins extend over the lands of five villages, and occupy a semicircle fully 4 miles in diameter. Among the antiquities the shrine of Rájá Jaipál ranks first in interest. The great mosque, which bears the name of Sítá's Kitchen, also dates back to Hindu times. Hinduism in Lower Bengal dates its legendary origin from a Bráhman migration southwards from this city, about 800 or 900. To this day all Bráhmans in the lower provinces trace their descent from one or other of the five Bráhman emigrants from Kanauj.

KANDAHAR, the largest city in Afghanistan, is situated in 31° 37′ N. lat. and 65° 43′ E. long., at a height of 3400 feet above the sea. It is 370 miles distant from Herat on the northwest, by Girishk and Farrah,—Girishk being 75 miles, and Farrah 225 miles from Kandahar. From Cabul, on the northeast, it is distant 315 miles, by Khelat-i-Ghilzai and Ghazni,—Khelat-i-Ghilzai being 85 miles, and Ghazni 225 miles from Kandahar. To the Pishin valley the distance is about 110 miles, and from Pishin to India the three principal routes measure approximately as follows.—by the Zhób valley to Dera Ismail Khan, 300 miles, by the Bóri valley to Dera Ghazi Khan, 275 miles, by Quetta and the Bolán to Dadur, 125 miles; and by Chappar and Nari (the proposed railway route) to Sibit, 120 miles. Sibit is connected by rail with the rest of India. Immediately round the city is a plain, highly

cultivated and well populated to the south and west; but on the northwest this plain is barren, and is bounded by a double line of rough and precipitous hills, rising to about 1000 feet above its general level, and breaking its dull monotony with irregular lines of scarped precipices, crowned with fantastic pinnacles and peaks. To the northwest these hills form the watershed between the valleys of the Argandab and the Tarnak, until they are lost in the mountain masses of the Hazarajat,—a wild region inhabited by tribes of Tartar origin, which effectually shut off Kandahar from communication with the north. On the southwest they lose themselves in the sandy desert of Registan, which wraps itself round the plain of Kandahar, and forms another impassable barrier.

But there is a break in these hills,—a gate as it were, to the great high road between Herat and India; and it is this gate which the fortress of Kandahar so effectually guards, and to which it owes its strategic importance. Other routes there are, open to trade, between Herat and northern India, either following the banks of the Hari Rud, or, more circuitously, through the valley of the Helmand to Cabul; or the line of hills between the Argandab and the Tarnak may be crossed close to Khelat-i-Ghilzai; but of the two former it may be said that they are not ways open to the passage of Afghan armies owing to the hereditary bitterness of hostility existing between the Eimák and Hazára tribes and the Afghans generally, while the latter is not beyond striking distance from Kandahar. The one great high road from Herat and the Persian frontier to India is that which passes by Farrah and crosses the Helmand at Girishk. Between Kandahar and India new and feasible means of communication are being discovered with every geographical search into the intermediate country. To the northwest, and parallel to the long ridges of the Tarnak watershed, stretches the great road to Cabul, the same which was traversed by Nott in 1842, and by Stewart and, more recently, by Roberts in 1880. Between this and the direct route to Pishin is a road, well known, though never yet traversed by a British force, which leads through Maruf to the Kundar river and the Guleri Pass into the plains of Hindustan at Dera Ismail Khan. This is the most direct route to northern India, but it involves the passage of some rough country, where lies the great watershed between the basins of the Helmand and the Indus. But the best-known road from Kandahar to India is that which stretches across the series of open stony plains, interspersed here and there with rocky hills of irregular formation, leading to the foot of the pass across the Kojak range, on the far side of which from Kandahar lies the valley of Pishin. The passage of the Kojak involves a rise and fall of some 2300 feet, but an excellent road now crosses the pass. The proposed line of railway to Kandahar follows an easier but comparatively waterless route, turning the Kojak at Gwaja (about 25 miles southwest of the Kojak Pass), and involving no serious gradients. Between the Pishin valley and India are several routes, all more or less open to a force equipped for mountain warfare, of which the best known are the Bolán and the Chappar (or Nari) passes from the plateau of Afghanistan to the plains of Sind at Jacobabad; and the Zhób and the Bóri valley routes leading through the Sulimani range to Dera Ismail and Dera Ghazi Khan respectively. The Bóri valley was the line followed by Sir M. Biddulph in 1879, and it diverges but slightly from that known as the Thal-Chotiali route. Thus Kandahar becomes a sort of focus of all the direct routes converging from the wide-stretching western frontier of India towards Herat and Persia, and the fortress of Kandahar gives protection on the one hand to trade between Hindustan and Herat, and on the other it lends to Cabul security from Herat invasion.

Kandahar is approximately a square-built city, surrounded by a wall of about 3¾ miles circuit, and from 25 to 30 feet high, with an average breadth of 15 feet. Outside the wall is a ditch 10 feet deep. The city and its defences are entirely mud-built, with no pretensions to architectural beauty. There are four main streets crossing each other nearly at right angles, the central "chouk" being covered with a dome. These streets are wide and bordered with trees, and are flanked by shops with open fronts and verandas much after the universal fashion of the East. There are no buildings of any great pretension in Kandahar, a few of the more wealthy Hindus occupying the best houses. The tomb of Ahmed Shah is the only attempt at monumental architecture. This, with its rather handsome cupola, and the twelve minor tombs of Ahmed Shah's children grouped around, contains a few good specimens of fretwork and of inlaid inscriptions. The four streets of the city divide it into convenient quarters for the accommodation of its mixed population of Duranis, Ghilzais, Parsiwans, and Kakuris, numbering in all some 30,000 souls. Of these the greater proportion are the Parsiwans (chiefly Kizilbashes).

It is reckoned that there are 1600 shops and 182 mosques in the city. The mullas of these mosques are generally men of considerable power. The walls of the city are pierced by the four principal gates of "Cabul," "Shikarpur," "Herat," and the "Idgah," opposite the four main streets, with two minor gates, called the Top Khana and the Bardurani respectively, in the western half of the city. The Idgah gate passes through the citadel, which is a square-built enclosure with sides of about 260 yards in length. The flank defences of the main wall are insufficient; indeed there is no pretence at scientific structure about any part of the defences; but the site of the city is well chosen for defence, and the water supply (drawn by canals from the Argandab or derived from wells) is good.

About 4 miles west of the present city, stretched along the slopes of a rocky ridge, and extending into the plains at its foot, are the ruins of the old city of Kandahar as it existed until it was sacked and plundered by Nadir Shah in 1738. From the top of the ridge a small citadel overlooks the half-buried ruins. On the northeast face of the hill forty steps, cut out of solid limestone, lead upward to a small, dome-roofed recess, which contains some interesting Persian inscriptions cut in relief on the rock, recording particulars of the history of Kandahar, and defining the vast extent of the kingdom of the emperor Baber. Popular belief ascribes the foundation of the old city to Alexander the Great.

Although Kandahar has long ceased to be the seat of government, it is nevertheless by far the most important trade centre in Afghanistan, and the revenues of the Kandahar province assist largely in supporting the chief power at Cabul. There are no manufactures or industries of any importance peculiar to Kandahar, but the long lines of bazaars display goods from England, Russia, Hindustan, Persia, and Turkestan, embracing a trade area as large probably as that of any city in Asia. The customs and town dues together amount to a sum equal to the land revenue of the Kandahar province, which is of considerable extent, stretching to Pul-i-Sangin, 10 miles south of Khelat-i-Ghilzai on the Cabul side, to the Helmand on the west, and to the Hazara country on the north. Although Farrah has been governed from Kandahar since 1863, its revenues are not reckoned as a part of those of the province. The land revenue proper is assessed in grain, the salaries of Government officials, pay of soldiers, etc., being disbursed by "barats" or orders for grain at rates fixed by Government, usually about 20 per cent. above the city market prices. The land revenue for the year 1877–78 amounted to 640,000 rupees English. English goods imported from Kurrachee pay upwards of 18 per cent. on their value at Kandahar. By the time they are exposed for sale at Herat they pay upwards of 28 per cent. *ad valorem*. Nevertheless the greater part of the English goods sold at Herat are imported by Kurrachee and Kandahar—a fact which testifies to the great insecurity of trade between Meshhed and Herat. Some of the items included as town dues are curious. For instance, the tariff on animals exposed for sale includes a charge of 5 per cent. *ad valorem* on slave girls, besides a charge of 1 rupee per head. The kidney fat of all sheep and the skins of all goats slaughtered in the public yard are perquisites of Government, the former being used for the manufacture of soap, which, with snuff, is a Govern-

ment monopoly. The imports consist chiefly of English goods, indigo, cloth, boots, leather, sugar, salt, iron, and copper, from Hindustan, and of shawls, carpets, "barak" (native woollen cloth), postins (coats made of skins), shoes, silks, opium, and carpets from Meshhed, Herat, and Turkestan. The exports are wool, cotton, madder, cummin seed, assafœtida, fruit, silk, and horses. The system of coinage is also curious: 105 English rupees are melted down, and the alloy extracted, leaving 100 rupees worth of silver; 295 more English rupees are then melted, and the molten metal mixed with the 100 rupees silver; and out of this 808 Kandahari rupees are coined. As the Kandahari rupee is worth about 8 annas (half an English rupee) the Government thus realizes a profit of 1 per cent. Government accounts are kept in "Kham" rupees, the "Kham" being worth about five-sixths of a Kandahari rupee; in other words, it about equals the franc, or the Persian "keran."

Immediately to the south and west of Kandahar is a stretch of well-irrigated and highly cultivated country, but it is the valley of the Argandab that possesses the chief local wealth of agriculture, and which, from the luxuriant abundance of its orchards and vineyards, offers the most striking scenes of landscape beauty. The wide extent of the pomegranate fields forms a striking feature in the valley,—the pomegranates of Kandahar, with its "sirdar" melons and grapes, being unequalled in quality by any in the East. The vines are grown on artificial banks, probably for want of the necessary wood to trellis them,—the grapes being largely exported in a semi-dried state. Fruit, indeed, besides being largely exported, forms the chief staple of the food supply of the inhabitants throughout Afghanistan. The art of irrigation is so well understood that the water supply is at times exhausted, no river water being allowed to run to waste. The plains about Kandahar are chiefly watered by canals drawn from the Argandab near Baba-wali, and conducted through the same gap in the hills which admits the Herat road. The amount of irrigation and the number of water channels form a considerable impediment to the movement of troops, not only immediately about Kandahar, but in all districts where the main rivers and streams are bordered by green bands of cultivation. Irrigation by "karez" is also largely resorted to. The karez is a system of underground channelling, which usually taps a sub-surface water supply at the foot of some of the many rugged and apparently waterless hills which cover the face of the country. The broad nullahs which seam their sides frequently possess a supply of water some distance below the surface which can be tapped by boring. The water is not brought to the surface, but is carried over long distances by an underground channel or drain, which is constructed by sinking shafts at intervals along the required course, and connecting the shafts by tunnelling. The general agricultural products of the country are wheat, barley, pulse, fruit, madder, assafœtida, lucerne, clover, and tobacco.

Of the mineral resources of the Kandahar district not much is known, but an abandoned gold mine exists about 2 miles north of the town. Some general idea of the resources of the Kandahar district may be gathered from the fact that it supplied the British troops with everything except luxuries during the entire period of occupation in 1879–81; and that, in spite of the great strain thrown on those resources by the presence of the two armies of Ayub Khan and of General Roberts, and after the total failure of the autumn crops and only a partial harvest the previous spring, the army was fed without great difficulty until the final evacuation, at one-third of the prices paid in Quetta for supplies drawn from India.

Kandahar has a stormy history. Sultan Mahmud of Ghazni took it in the 11th century from the Afghans who then held it. In the beginning of the 13th century it was taken by Jenghiz Khan, and in the 14th by Timur. In 1507 it was captured by the emperor Babar, but shortly afterwards it fell again into Afghan hands, to be retaken by Baber in 1521. Baber's son, Humayun, agreed to cede Kandahar to Persia, but failed to keep his word, and the Persians besieged the place unsuccessfully. Thus it remained in the possession of the Moghuls till 1625, when it was taken by Shah Abbas. Aurungzebe tried to take it in 1649 with 5000 men, but failed. Another attempt in 1652 was equally unsuccessful. It remained in Persian possession till 1709, when it was taken by the Afghans, but was retaken after a two years' siege by Nadir Shah. Nadir Shah was assassinated in 1749, and immediately on hearing the news of his death Ahmed Shah (Abdalli) seized Nadir Shah's treasure at Kandahar, and proclaimed himself king, with the consent, not only of the Afghans, but, strange to say, of the Hazáras and Baluchis as well. He at once changed the site of the city to its present position, and thus founded the Afghan kingdom, with modern Kandahar as its capital. Ahmed Shah died in 1773, and was succeeded by his son Taimur, who died in 1793, and left the throne to his son Zamán Shah. This prince was deposed by his half brother Mahmud, who was in turn deposed by Shah Suja, the full brother of Zamán Shah. After a short reign Shah Suja was compelled to abdicate from his inability to repress the rising power of Fatteh Khan, a Barakzai chief, and he took refuge first with Runjit Singh, who then ruled the Punjab, and finally secured the protection of British power. Afghanistan was now practically dismembered. Mahmud was reinstated by Fatteh Khan, whom he appointed his vizier, and whose nephews, Dost Mahommed Khan and Kohn dil Khan, he placed respectively in the governments of Cabul and Kandahar. Fatteh Khan was barbarously murdered by Kamrán (Mahmud's son), near Ghazni in 1818; and in retaliation Mahmud himself was driven from power, and the Barakzai clan secured the sovereignty of Afghanistan. While Dost Mahommed held Cabul, Kandahar became temporarily a sort of independent chiefship under two or three of his brothers. In 1839 the cause of Shah Suja was actively supported by the British. Kandahar was occupied, and Shah Suja reinstated on the throne of his ancestors. Dost Mahommed was defeated near Cabul, and after surrender to the British force, was deported into Hindustan. The British army of occupation in southern Afghanistan continued to occupy Kandahar from 1839 till the autumn of 1842, when General Nott marched on Cabul to meet Pollock's advance from Jalalabad. The cantonments near the city, built by Nott's division, were repaired and again occupied by the British army in 1879, when Shere Ali was driven from power by the invasion of Afghanistan, nor were they finally evacuated till the spring of 1881.

(T. H. H.)

KÁNDÍ, a town in Murshidábád district, Bengal, India, in 23° 58′ N. lat., 88° 5′ 1″ E. long., with a population in 1872 of 12,016, viz., Hindus, 10,452; Mahometans, 1516; "others," 48. It is the residence of the rájás of Páikpárá, a wealthy and devout Hindu family. The founder of this family was Gangá Govind Sinh, the *bania* of Warren Hastings, who was born at Kándí, and retired thither in his old age with an immense fortune. His name has acquired celebrity for the most magnificent *sraddha*, or funeral obsequies, ever performed in Bengal, celebrated in honor of his mother at a cost, it is said, of £200,000.

KANDY, a town of Ceylon, formerly the capital of a kingdom of the same name, situated towards the heart of the island, at a height of 1713 feet above the sea, 74¾ miles by rail from Colombo. It lies round the margin of an artificial lake constructed by the last king of Kandy in 1806, and has a population of 26,522 (1901). The most striking objects of interest are the temples (of which twelve are Buddhist and four Brahman), the tombs of the Kandian kings, and the various buildings of the royal residence, partly allowed to fall into disrepair, partly utilized by the Government. Of the temples the Dalada Malagawa is worthy of particular mention; it claims, as the name indicates, to be in possession of a Buddha tooth. Kandy is the seat of a Government agent and of a district judge, and regular sessions of the criminal court are held in the town. As a municipality (constituted in 1865, and divided into five wards in 1871) it is governed by a body of eight councillors. Among the public buildings and institutions are the Government house or pavilion, erected in 1824, the planters' association, two libraries, an industrial school, and Trinity College, established in 1857, and reopened in 1871 after being closed for six years. The Church Missionary Society, to which the college owed its existence, began its labors in 1818.

Kandy was occupied by the Portuguese in the 16th century and by the Dutch in 1763; but in both instances the native kings succeeded in shaking off the foreign yoke. The British got possession of the place in 1803, but the garrison afterwards capitulated and were massacred, and it was not till 1814–15 that the king was defeated and dethroned. The British authority was formally established by the convention of March 2, 1815. In 1848, owing to an attempt at rebellion, the town was for a time under martial law.

KANE, Elisha Kent (1820–1857), American traveller, scientist, and arctic explorer, was born in Philadelphia, on February 3, 1820, the eldest of seven

children. His father was judge of the eastern district of Pennsylvania, and through both parents he inherited a mixture of Irish, English, Scotch, and Dutch blood. In his boyhood, in spite of feebleness of body, he was remarkable for his activity, vivacity, and energy. While still at school he showed a fondness for outdoor pastime and enterprise, and a decided leaning towards scientific pursuits. Having chosen civil engineering as a profession, he entered the university of Virginia, where he continued to show his taste for science, especially chemistry, mineralogy, and physical geography. A violent attack of heart disease, however, which stuck to him to the end of his life, induced him to abandon engineering and devote himself to the study of medicine. He obtained his doctor's degree in 1842, having already acquired a reputation in physiological research. In 1843 Kane entered the U. S. navy as surgeon, and was appointed to the "Brandywine," commissioned to carry Caleb Cushing as U. S. minister to China. While the vessel remained at Rio Janeiro the restless and eager Kane made a journey to the skirts of the Andes and explored their geology. Leaving the ship again at Bombay, he indulged his irrepressible exploring proclivities by a journey up country, rejoining his ship at Ceylon. On his arrival at his destination, Macao, he provided a substitute for his post in the embassy, crossed and explored the island of Luzon, visited the mysterious volcano of Taal, and, amid many difficulties, descended its steep crater, bringing up with him specimens of its lava. Finally resigning his position on the embassy, he practised for a time at Whampoa, where he was stricken down by rice fever. In August, 1844, he left China, and, returning by India (where he visited the Himalayas), Persia, Syria, Egypt, Greece, Austria, Germany, and Switzerland, reached home in 1846. In May of that year he was ordered to the west coast of Africa, where he visited the kingdom of Dahomey, and caught the African fever, which told severely on his constitution. On his return in April, 1847, he exchanged the naval for the military service, and was sent to join the U. S. army in Mexico, where he had some extraordinary adventures in endeavoring to reach his destination, and where he was again laid down with fever. In February, 1849, he was presented with a sword by the city of Philadelphia, and in the same year made a visit to the Mediterranean and afterwards to the West Indies. On the fitting out of the first Grinnell expedition, in 1850, to search for Sir John Franklin, Kane was appointed surgeon and naturalist under Lieutenant De Haven, who commanded the two ships, the "Advance" and "Rescue." The expedition left New York on May 22d; and after an absence of sixteen months, during nine of which the ships were ice-bound, they returned without having found any trace of the missing vessels. Kane was in feeble health, but worked on at his narrative of the expedition, which was published in 1854, under the title of *The U. S. Grinnell Expedition in Search of Sir John Franklin*. He also read a paper at the American Geographical Society on an "Open Polar Sea," a chimæra which was to play so important and delusive a rôle in subsequent Arctic explorations. Kane was determined not to give up the search for Franklin, but Government refused all help. In spite of feeble health, he travelled through the States lecturing to obtain funds, and gave up his pay for twenty months. Mr. Grinnell again came to the rescue, with the brig "Advance," which was equipped with the help of Mr. Peabody and some of the learned societies. It sailed on the 30th of May, 1853, and on August 23d reached 78° 41′ in Rensselaer Bay, off the coast of Greenland, where it remained fast during the whole time the expedition was out. During the first winter a sledge party was sent out, and reached 79° 50′, though at the expense of terrible sufferings. During the second winter the expedition suffered greatly from want of food and fuel, as well as from scurvy. Still Kane carried on with incessant diligence his scientific observations—magnetic, meteorological, astronomical and tidal; and the results were afterwards published in the *Smithsonian Contributions to Knowledge*, vols. x.–xiii., 1858. One of the most notable incidents of this expedition was the journey made by Morton, one of the staff, up Kennedy Channel, as far as Cape Independence, in 81° 22′ N. lat., whence he saw what he and Kane firmly believed to be an "open polar sea." No doubt a large area of open water was seen, but a permanent open sea in this direction has long ago been proved a myth, though doubtless the constant shiftings of the ice often leave considerable areas of water uncovered at continually shifting points. After the endurance of the greatest hardships, it was finally resolved to abandon the ship, which was done on May 17, 1855, Upernivik being reached after many difficulties on August 5. Kane reached home in October in good health, and set himself at once to write the narrative of his expedition, which was published in 1856. In October of the same year he left Philadelphia for England in search of health. From England he went to Cuba, where he died at Havana on February 16, 1857, at the early age of thirty-seven. Between his first and second Arctic voyages, Kane made the acquaintance of the Fox family, the celebrated spiritualists. With one of the daughters, Margaret Fox, he carried on a lengthened correspondence, which was afterwards published by the lady, who declares that they were privately married before Kane left for England. Notwithstanding his weak health, Kane was a man of restless activity and high intelligence, but much of that activity appears to have been wasted. He certainly did a vast amount of work during his short life, but will be remembered mainly for his chivalrous and self-sacrificing but fruitless search for Franklin, during which he appreciably advanced our knowledge of the Arctic area, and made important contributions to physics and biology.

See, besides the works mentioned above, *Biography of E. K. Kane*, by William Elder, 1858; *Life of E. K. Kane and other American Explorers*, by S. M. Smucker; *The Love-Life of Dr. Kane, containing the Correspondence and a History of the engagement and Secret Marriage between E. K. Kane and Margaret Fox*, New York, 1866; "Discoveries of Dr. Kane," in *Jour. of the Roy. Geog. Soc.*, vol. xxviii., reprinted in *R. G. S. Arctic Papers of* 1875.

KANEFF, or KANIEFF, a town of Russia, in the Kieff government, on the Dnieper, 141 miles southeast of Kieff. The population, which in 1863 was returned as 6838, was about 8892 in 1897; but neither the trade nor the industry of the place is of importance.

Vsevolod of Kieff founded a church at Kanieff in 1144, and in the latter part of the same century the place was the annual rendezvous of the forces collected to give protection to the merchant ships returning from Greece. In 1880 Poniatoffski, to whom it had passed from Stanislaus Augustus, gave the revenues of the town and the site of the royal court to the prior of the Basilians, who assigned them to the Kaneff schools of the brotherhood. The administration of the Boguslaff district was transferred to Kaneff in 1837, and in 1844 the district took the name of that town.

KANGAROO. When Captain Cook, during his first memorable voyage of discovery, was detained, for the purpose of refitting his ship at Endeavor river, on the northeast coast of Australia, a strange-looking animal, entirely unknown to them, was frequently seen by the ship's company; and it is recorded in the annals of the voyage that, on the 14th of July, 1770 "Mr. Gore, who went out this day with his gun, had the good fortune to kill one of the animals which had been so much the subject of our speculation, . . and which is called by the natives kanguroo,"[1] a name which, though it does not appear to be now known to any of the aboriginal tribes of the country, has been adopted for this animal in all European languages,

[1] Hawkesworth, *Collection of Voyages*, vol. iii. p. 577 (1773)

with only slight modifications of spelling. With the exception of a passing glimpse in the beginning of the same century by the Dutch traveller Bruyn of some living examples of an allied species, to be referred to presently, this was the first introduction to the civilized world of any member of a group of animals now so familiar. The affinities of the species, skins of which were brought home by Captain Cook and subsequent voyagers, were recognized by Schreber as nearer to the American opossums (then the only known marsupials) than to any other mammals with which zoologists were acquainted, and consequently it was placed by him, in his great work on the Mammalia, then in the course of publication, in the genus *Didelphis*, with *gigantea* for a specific designation,—the latter having been bestowed upon it by Zimmer-

FIG. 1.—Kangaroo (*Macropus giganteus*).

man under the impression that it was a huge species of jerboa. Soon afterwards (1791) Dr. Shaw very properly formed a new genus for its reception, which he named *Macropus*, in allusion to the peculiar length of its hind foot. By the name thus formed, *Macropus giganteus*, this kind of Kangaroo has ever since been known in zoological literature.

Further explorations in Australia and the neighboring islands have led to the discovery of a very considerable number of species, which are now included in the family *Macropodidæ*, one of the subdivisions of the order *Marsupialia*, for the characters of which see MAMMALIA.

The *Macropodidæ*, or kangaroos, taken as a whole, form a very well marked family, easily distinguished from the remaining members of the order by their general conformation, and by peculiaritics in the structure of their limbs, teeth, and other organs. They vary in size from that of a sheep down to a small rabbit. The head, especially in the larger species, is small, compared with the rest of the body, and tapers forward to the muzzle. The shoulders and fore limbs are feebly developed, and the hind limbs of disproportionate strength and magnitude, which gives them a peculiarly awkward appearance when moving about on all fours, as they occasionally do when feeding. Rapid progression is, however, performed only by the powerful hind limbs, the animal covering the ground by a series of immense bounds, during which the fore part of the body is inclined forwards, and balanced by the long, strong, and tapering tail, which is carried horizontally backwards. When not moving they often assume a perfectly upright position, the tail aiding the two hind legs to form a sort of supporting tripod, and the front limbs dangling by the side of the chest. This position gives full scope for the senses of sight, hearing, and smell to warn of the approach of enemies, from which they save themselves by their bounding flight. The fore paws have five distinct digits, each armed with a strong, curved claw. The foot of the hind limb is quite different, and very peculiar in construction, being extremely long and narrow, and (with only one, lately discovered, exception) without any hallux or great toe. It consists mainly of one very large and strong toe, corresponding to the fourth of the human or other typically developed foot, ending in a strong curved and pointed claw. Close to the outer side of this lies a smaller fifth digit, and to the inner side two excessively slender toes (the second and third), bound together almost to the extremity in a common integument. The two little claws of these toes, projecting together from the skin, may be of use in scratching and cleaning the fur of the animal, but the toes must have quite lost all connection with the functions of support or progression.

FIG. 2.—Skeleton of hind foot of Kangaroo.

The dental formula, when completely developed, is *incisors* $\frac{3}{1}$, *canines* $\frac{1}{0}$, *premolars* $\frac{2}{2}$, *molars* $\frac{4}{4}$ on each side, giving a total of thirty-four teeth. The three incisors of the upper jaw are arranged in a continuous arched series, and have crowns with broad cutting edges; the first or middle incisor is often larger than the others. Corresponding to these in the lower jaw is but one tooth on each side, but it is of great size, procumbent or directed horizontally forwards, narrow, lanceolate, pointed, and with sharp edges. Owing to the laxity of the union of the two rami of the lower jaw at the symphysis, in many species the two lower incisors can be made to work together like the blades of a pair of scissors, a very remarkable arrangement not known to occur in other mammals. The canines

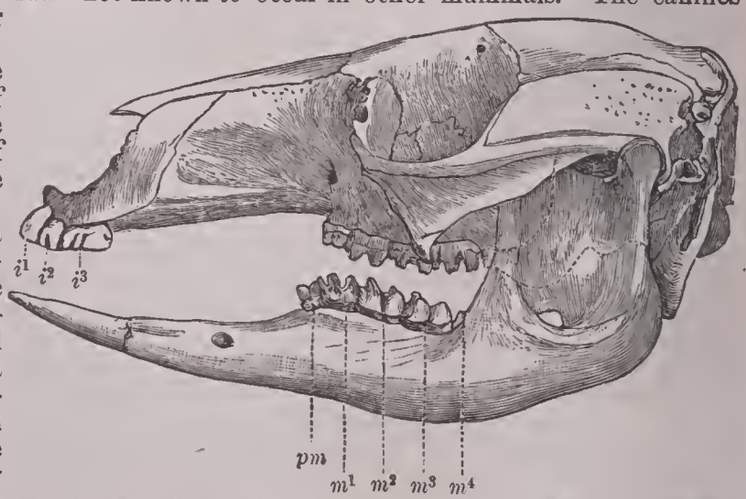

FIG. 3.—Skull and teeth of Bennett's Kangaroo (*Macropus bennettii*). i^1, i^2, i^3, first, second, and third upper incisors; pm, second or posterior premolar (the first having been already shed); m^1, m^2, m^3, m^4, the four true molars. The last, not fully developed, is nearly concealed by the ascending ramus of the jaw.

are absent or rudimentary, always so in the lower jaw, and often deciduous at an early age in the upper jaw. The premolars are compressed, with cutting longitudinal edges, the anterior one is always deciduous, being lost about the time the second one replaces the milk molar, so that both premolars are never found in place and use in the same individual. The true molars have quadrate crowns, provided with two strong trans-

verse ridges, or with four obtuse cusps. In *Macropus giganteus* and its immediate allies, both premolars and one or two of the anterior true molars are shed during the lifetime of the animal, so that in old examples only the two posterior molars and the incisors are found in place. The milk dentition, as in other marsupials, is confined to a single molar tooth on each side of each jaw, the other molars and incisors being never changed. The dentition of the kangaroos, functionally considered, thus consists of sharp-edged incisors, most fully developed near the median line of the mouth, for the purpose of cropping the various kinds of herbage on which they feed, and ridged and tuberculated molars for crushing it, there being no tusks or canines for offensive or defensive purposes.

The number of vertebræ is—in the cervical region 7, dorsal 13, lumbar 6, sacral 2, caudal varying according to the length of the tail, but generally from 21 to 25. In the fore limb the clavicle and the radius and ulna are well developed, allowing of considerable freedom of motion of the hand. The pelvis has large epipubic or "marsupial" bones. The femur is short, and the tibia and fibula of great length, as is the foot, the whole of which is applied to the ground when the animal is at rest in the upright position.

The stomach is of large size, and very complex, its walls being puckered up by longitudinal muscular bands into a great number of sacculi, like those of the human colon. The alimentary canal is long, and the cæcum well developed. All the species have a marsupium or pouch formed by a fold of the skin of the abdomen, covering the mammary glands with their four nipples. In this pouch the young (which, as in other marsupials, leave the uterus in an extremely small and imperfect condition) are placed as soon as they are born; there their growth and development proceeds; and to it they resort temporarily for the purpose of shelter, concealment, or transport, for some time after they are able to run and jump about the ground and feed upon the same herbage which forms the nourishment of the parent. During the early period of their sojourn in the pouch, the blind, naked, helpless young creatures (which in the great kangaroo scarcely exceed an inch in length) are attached by their mouths to the nipple of the mother, and are fed by milk injected into their stomach by the contraction of the muscle covering the mammary gland. In this stage of their existence the respiratory organs are modified much as they are permanently in the *Cetacea*, the elongated upper part of the larynx projecting into the posterior nares, and so maintaining a free communication between the lungs and the external surface, independently of the mouth and gullet, thus averting all danger of suffocation while the milk is passing down the latter passage.

The kangaroos are all vegetable feeders, browsing on grass and various kinds of herbage, the smaller species also eating roots. They are naturally timid, inoffensive creatures, but the larger ones when hard pressed will turn and defend themselves, sometimes killing a dog by grasping it in their fore paws, and inflicting terrible wounds with the sharp claws of their powerful hind legs, sustaining themselves meanwhile upon the tail. The great majority are inhabitants of Australia and Tasmania, forming one of the most prominent and characteristic features of the fauna of these lands, and in the scenery of the country, as well as the economy of nature, performing the part of the deer and antelopes of other parts of the world, which are entirely wanting in Australia. They were very important sources of food-supply to the natives, and are hunted by the colonists, both for sport and with a view to their destruction, on account of the damage they naturally do in consuming the grass, now required for feeding cattle and sheep. Notwithstanding this, they have in some districts increased in numbers, owing to the suppression of their former enemies, the aborigines and the dingo or native dog. A few species are found in New Guinea and the adjacent islands, which belong, in the zoological sense, to the Australian province, beyond the bounds of which none have been found either existing or in a fossil state.

The *Macropodidæ* are divided into two well-marked sections—(1) the true kangaroos (*Macropodinæ*), and (2) a group consisting of smaller animals, commonly called rat-kangaroos, or (improperly) "kangaroo-rats," or sometimes potoroos.

I. In the *Macropodinæ* (see fig. 3) the cutting edges of the upper incisors are nearly level, or the first pair but slightly longer than the others. The canines are rudimentary and often wanting. The premolars are usually not longer (from before backwards) than the true molars, and less compressed than in the next section. The crowns of the molars have always two prominent transverse ridges. The fore limbs are small, with subequal toes, armed with strong, moderately long, curved claws. Hind limbs very long and strongly made. Head small, with more or less elongated muzzle. Ears generally rather long and ovate.

Upwards of thirty species of this group have been described, and many attempts have been made to subdivide it into smaller groups or genera for the convenience of arrangement and description, but these have generally been based upon such trivial characters that it is preferable to speak of most of them as sections of the genus *Macropus*, reserving generic rank only to two forms somewhat aberrant both in structure and geographical distribution. According to this arrangement the genera will be as follows:

1. *Macropus*, Shaw, divided into the following sections or sub-genera. **A.** *Macropus* proper, of which the type is *M. giganteus*, spoken of at the beginning of this article as having been discovered in 1770 by the first English explorers of Australia. It is the common great kangaroo, called "boomer," "forrester," or "old man" by the colonists, and frequents the open grassy plains of the greater part of eastern Australia and Tasmania. Some closely allied species or perhaps local varieties, *M. ocydromus*, *M. fuliginosus*, and *M. melanops*, are found in southern and western Australia. **B.** *Osphranter*, Gould, distinguished from the above by the naked muffle, includes some very large and handsome species, which principally dwell in rocky mountain ranges, as the great red kangaroo, *M. rufus*, *M. antilopinus*, and *M. robustus*. **C.** *Halmaturus*, F. Cuv. The kangaroos of this section have also the muffle naked, but they are rather smaller species, frequenters of forests and dense impenetrable brushes and scrubs, and hence often called brush kangaroos, though a native name "wallaby" is now generally applied to them. There are many species, of which *M. bennettii*, *M. ruficollis*, *M. ualabatus*, *M. dorsalis*, *M. agilis*, *M. derbianus*, *M. thetidis*, *M. billardieri* are the best known. *M. brachyurus* is remarkable for its comparatively short and slender tail and small ears. The earliest known species of kangaroo, referred to before, *M. brunii* (Schreber), may perhaps belong to this section. Several examples were seen by Bruyn in 1711 living in captivity in the garden of the Dutch governor of Batavia, and described and figured in the account of his travels (*Reizen over Moskovie*, etc.) under the name of "Filander." It was quite lost sight of, and its name even transferred by S. Müller to another species (now known as *Dorcopsis mülleri*, Schlegel) until rediscovered in 1865 by Rosenberg, who sent a series of specimens to the Leyden Museum from the islands of Aru and Great Key, thus determining its true habitat. Quite recently three other species of true kangaroo have been discovered out of Australia:—*M. papuanus*, Peters, from the eastern extremity of New Guinea, near Yule Island; *M. crassipes*, Pierson-Ramsay, from near Port Moresby; and *M. browni*, Piersou-Ramsay, from New Ireland. **D.** *Onychoyalea*, Gould, with a hairy muffle and long slender tail, furnished with a horny nail-like organ at the apex. *M. unguifer*, *M. frænatus*, and *M. lunatus*. **E.** *Lagorchestes*, Gould, hare-kangaroos, a group of small hare-like animals, great leapers and swift runners, which mostly affect the open grassy ridges, particularly those of a stony character, sleeping in forms or seats like the common hare. Their limbs are comparatively small, their claws sharp and slender, and their muffle clothed with velvet-like hairs. *M. fasciatus*, *M. leporoides*, *M. hirsutus*, *M. conspicillatus*, etc. **F.** *Petrogale*, Gray. These differ from all the others in having the tail cylindrical and bushy towards the apex instead of tapering. The muffle is naked, the hind foot comparatively short and stout, and densely clothed with coarse hairs, the nails short. These are the "rock kangaroos," making their retreats in caverns and crevices, leaping with surprising agility from one narrow ledge to another, and browsing upon the scanty herbage that the neighborhood of such situations affords. *M. xanthopus*, *M. penicillatus*, *M. lateralis*, *M. concinnus*, *M. brachyotus*, *M. inornatus*, etc.

2. *Dendrolagus*, Sal. Müller.—A genus formed for the reception of two species, *D. ursinus* and *D. inustus*, commonly known as "tree kangaroos," both inhabitants of New Guinea, and which differ greatly from all the foregoing in being chiefly arboreal in their habits, climbing with facility among the branches of large trees, and feeding on the bark, leaves, and fruit. In accordance with this habit their hinder limbs are comparatively shorter than in the true kangaroos, and their fore limbs are longer and more robust, and have very strong curved and pointed claws. These differ from all the preceding, and agree with the next genus, in some details of the structure of the molar teeth, and in the circumstance that the fur of the back of the neck is directed forwards or in a reverse position to that of the remainder of the coat.

3. *Dorcopsis*, S. Müller.—Of this genus two species are at present known, both from New Guinea, *D. mülleri*, and another lately discovered by D'Albertis, *D. luctuosa*. In some respects they resemble the last, but they differ from them and all the other *Macropodinæ*, and agree with the next section, in the great size and peculiar form of the premolar teeth.

II. The second section or sub-family, the *Hypsiprymninæ* (see fig. 4), have the first upper incisor narrow, curved, and much exceeding the others in length. Upper canines always persistent, flattened, blunt, and slightly curved. Premolars of both jaws always with large, simple, compressed crowns, with a nearly straight or slightly concave free cut-

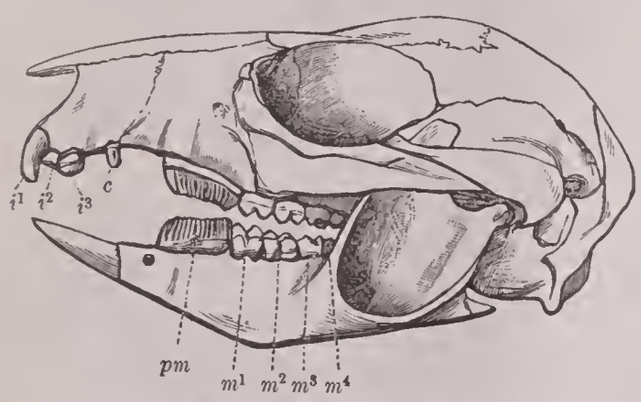

FIG. 4.—Skull and teeth of Gray's Rat Kangaroo (*Bettongia grayii*). c, upper canine tooth. The other letters as in fig. 3.

ting edge, both outer and inner surfaces usually marked by a series of parallel, vertical grooves and ridges. Molars with quadrate crowns, having a blunt, conical cusp at each corner, the fourth notably smaller than the third, sometimes rudimentary or absent. Fore feet narrow; three middle toes considerably exceeding the first and fifth in length; their claws long, compressed, and but slightly curved. Hind feet as in *Macropus*. Tail long, sometimes partially prehensile, being used for carrying bundles of grass with which they build their nests.

The potoroos or rat-kangaroos are all small animals, none of them exceeding a common rabbit in size. They inhabit Australia and Tasmania, are nocturnal, and feed on the leaves of various kinds of grasses and other plants, as well as roots and bulbs, which they dig up with their fore paws. About ten species are known, presenting a considerable range of diversity in minor characters, and admitting of being grouped in four principal sections, which may perhaps be allowed the rank of genera. These are

1. *Hypsiprymnus*, Illiger.—Head long and slender. Auditory bullæ somewhat inflated. Ridges on premolars few and perpendicular. Large palatine foramina. Tarsus short. Muffle naked. *H. murinus, H. apicalis, H. gilberti, H. platyops.*

2. *Bettongia*, Gray.—Head comparatively short and broad. Auditory bullæ much inflated. Tarsus long. Large palatine foramina. Ridges on premolars numerous and oblique. Muffle naked. *B. penicillatus, B. cuniculus, B. gaimardii, B. ogilbyi, B. grayii, B. campestris*, etc.

3. *Æpyprymnus*, Garrod.—Head short and broad. Auditory bullæ not inflated. No palatine foramina. Tarsus long. Muffle hairy. *Æ. rufescens.*

4. *Hypsiprymnodon*, Pierson-Ramsay.—Distinguished from all other members of the family by possessing a small prehensile hallux or first toe, without nail. It is, therefore, a form of great interest, as showing a structure of foot connecting that of the kangaroos with that of the phalangers. The single known species, *H. moschatus*, Ramsay, has been lately discovered in northeast Australia. It was described almost simultaneously by Owen under the name of *Pleopus nudicaudatus.*

In seeking among the other marsupials for the nearest allies to the kangaroos, using this word in the comprehensive sense as above, two most striking points in their organization must be borne in mind, the structure of the hind foot and the dentition. Of the former the essential peculiarity is the great predominance of the fourth digit, and the remarkable character of the second and third, which while retaining a considerable length, are of extreme tenuity, and buried up to the claws in a common integument. Such a structure of foot is quite unknown out of the marsupial order, but in that order it is found in the *Phalangistidæ* in a very modified form, associated with a large opposable hallux, and a broad sole of the foot, appropriate for climbing trees; and again, in almost the same form as in the kangaroos, in the ground-dwelling *Peramelidæ*, which in their dentition and digestive organs are so widely different. The Australian carnivorous marsupials, *Dasyuridæ*, and the American opossums or *Didelphidæ*, show no trace of this singular conformation. It is therefore only with the former families, the *Phalangistidæ* and the *Peramelidæ*, that the kangaroos are allied by this character.

The chief peculiarity of the dentition consists in the presence of three pairs of incisors in the upper jaw, the first or middle one of which is generally the largest, opposed to a single pair in the lower jaw, strong, sharp, and procumbent. These are followed by an interval, in which may be, in the upper jaw only, a canine, but always so small, as to be of little functional importance. The premolars are compressed and cutting, and the true molars ridged or tuberculated. Such a dentition is found among the *Phalangistidæ* alone of existing marsupials. In this respect the *Peramelidæ* are completely separated from the kangaroos, their numerous small incisors, large canines, and cuspidated molars resembling those of the *Dasyuridæ* and *Didelphidæ*. On the whole then, the kangaroos and the phalangers are groups most nearly allied in essential characters, having both dentition and extremities formed upon the same fundamental type, though with modifications of the latter to suit their respective terrestrial and arboreal habits.

Remains of numerous extinct species of true kangaroos, many of them of much larger size than any now existing, are abundant in the Pleistocene deposits of Australia, and have been described and figured by Professor Owen in the *Philosophical Transactions*. Hitherto they have been found in no other part of the world. Other animals of gigantic size, the *Diprotodon*, as large as a rhinoceros, and the *Nototherium*, but little inferior, with dentition of the same general type, but the structure of whose feet is not yet known, lived with these kangaroos in the same land. An extraordinary modification of the *Hypsiprymnus* type, with the great premolar characteristic of that genus immensely exaggerated in size, and the true molars equally reduced, misnamed *Thylacoleo carnifex*, was another contemporary. Beyond these, which all belong to the most recent geological epoch, we have no knowledge of any extinct animals which can be said to be nearly allied to kangaroos, or to connect them with any other forms of mammals. The only marsupials discovered in European Tertiaries resemble the existing opossums of America, and except in their common marsupial characters have no affinities with the kangaroos.

It is, however, a most remarkable fact that in the Purbeck beds of the newer Oolitic series, not only in England, but also in deposits of corresponding age in America, lower jaws of smaller mammals (to which Dr. Falconer gave the name of *Plagiaulax*), with a type of dentition showing a considerable resemblance to that described above as peculiar to the kangaroos and their existing allies, have been discovered. Unfortunately no part of the skull or upper teeth, or of the limbs of any of these is as yet known; so whether the resemblance was fully carried out, even in the dentition.

is uncertain, and it is almost too great a stretch of the imagination to assume that the modern "diprotodont" marsupials have derived their special type of tooth-structure from such remote ancestry. The evidence of the affinity of the still more ancient *Hypsiprymnopsis* (Boyd Dawkins), founded upon a single and much worn tooth, having some resemblance to one of the large premolars of the *Hypsiprymnus*, found in the infra-Liassic beds of Watchet in Somersetshire, is based on still slighter foundation; but, if it should eventually turn out to be well-grounded, it would carry back the type to an extraordinary antiquity.

Soc.*, 1875, p. 48. (W. H. F.)

KÁNGRA, a district in the lieutenant-governorship of the Punjab, India, lying between 31° 20′ and 33° N. lat., and between 75° 39′ and 78° 55′ E. long, bounded on the N.W. by Gurdaspur district and Chamba state, on the N.E. by the Himálaya mountains, on the S.E. by the states of Bashahr, Mandi, and Biláspur, and on the S.W. by Hoshiarpur district, with an area of 8988 square miles. Kángra district comprises a vast tract, extending eastward from the plain country of the Bári and Jalandhar Doábs, across two distinct Himálayan ranges, far into the heart of Thibet. It naturally falls into three parts—the sub-Himálayan country of Kángra proper, the central valleys of Kullu and Bangáhal, and the rugged outer region of the Tibetan slope. It consists almost entirely of immense mountain ranges, whose three parallel lines, with a transverse ridge, form four main basins, in each of which a great river takes its rise—the Beas (Biás), Spiti, Chenáb, and Rávi. From the great variety of the different tracts included in the district by modern arrangements, it is impossible to assign any general physical peculiarities to the whole beyond their common characteristic as mountainous regions, intersected by snowy chains and scored by deep river valleys. The western portion, abutting on the Punjab plains, admits of cultivation, and supports a comparatively dense population; while the bare and sterile eastern glens are sparsely inhabited by a Tibetan race.

The census of 1868 disclosed a population of 743,882 (393,571 males and 350,311 females),—83 to the square mile. The Hindus numbered 693,505; Mahometans, 48,613; Síkhs, 1314; Christians, 277; and "others," 173. The six municipal towns with their population are—Núrpur, 7151; Kángra, 6344; Haripur, 3839; Sujanpur Tira, 3393; Jawálamukhi, 2847; Dharmsala, 2024. The famous Hindu temple of Nágarkot at Kángra town is one of the oldest and most wealthy shrines in India, and twice exposed the district to the plunder of the Mahometans.

The cultivated area of the district is returned at 681 square miles, or less than one-thirteenth of the entire surface. The staple crops include wheat and barley for the spring, and rice and maize for the autumn harvest. Rice is the principal crop of the upper valleys, while maize composes the ordinary food of the upland people for six months of the year. Sugar-cane covers a large area in the neighborhood of Kángra town. Tea cultivation has taken root as an important industry, both in Kángra proper and in Kullu. In 1872–73 the district contained twenty-eight plantations, producing a gross out-turn of 428,655 lbs. of tea, valued at £65,000. Potatoes also constitute a considerable crop. In Láhúl and Spiti barley is the agricultural staple; but the former tract does not grow a sufficient quantity of grain for its own consumption, being largely supplied by importations from Kullu.

Agricultural produce forms the staple of the export trade; the imports consist of grain, cotton, tobacco, and European piece goods. The Pálampur fair, established by Government with a view to fostering commerce with Central Asia, draws together a small concourse of Yárkandi merchants. The Láhúlis carry on an enterprising trade with Ladákh and countries beyond the frontier, by means of pack sheep and goats. The total imperial revenue in 1872–73 amounted to £71,434, of which the land-tax contributed £62,443. Crime is rare, but education is still in a very backward state, only 2936 children being under instruction in 1872–73. The endemic diseases of the district include fever and goitre, but scurvy also prevails to a large extent. The widespread cultivation of rice, by which the whole Kangsa valley is converted into a swamp, has a very prejudicial effect upon the general health. The average annual rainfall varies from 148 inches at Dharmsála to 76 at Kángra, 52 at Hamírpur, and 108 at Pálampur. The mean temperature in the Himálayan station of Dharmsála in 1874–75 was 70°.35 in May, 73°.5 in July, and 52°.85 in December.

KANIZSA, Nagy (*i. e.*, "Great"), a market-town of Hungary, in the trans-Danubian county of Zala, lies 31 miles north-northeast of Kopreinitz, and at the junction of the lines of railway from Sopron (Oedenburg) and Székesfehérvár (Stuhlweissenburg), 46° 28′ N. lat., 17° 0′ E. long. Among the public and other buildings are a fine Roman Catholic church, a Franciscan monastery, a Piarist gymnasium, a town-hall, royal and magisterial courts of law, and the usual Government offices. In the neighborhood are distilleries and brick-making factories. The markets periodically held in the town are much frequented, and the trade in grain, horned cattle, and pigs is generally brisk. The population at the end of 1900 was 23,978.

Nagy-Kanizsa once ranked as the second fortress of Hungary, and consequently played an important part during the wars with the Turks, who, having gained possession of it in 1600, held it until near the close of the 17th century. In 1690, after a siege of two years, it was recovered by the Austrian and Hungarian forces. Its reversion to Hungary was ratified by the treaty of Carlowitz (1699). In 1702 the fortifications were destroyed, and there are now but few traces of their former existence.

KANKAKEE, the chief city and county seat of Kankakee county, Illinois, U. S., is situated on the north bank of the Kankakee river, 56 miles south of Chicago. It is the centre of a very rich and fertile farming district, and has a large trade in agricultural produce. It has fine water-power, and, being within easy reach of extensive coal-fields and deposits of bog-iron ore, does a large manufacturing business. The population of the city and township in 1900, 13,595.

KANO, a town of central Africa, at the head of a province of the kingdom of Sokoto, about 230 miles east of Sokoto and 360 miles west of Kuka. The circuit of the walls is upwards of 15 English miles; but little more than a third of the enclosed area was actually occupied at the time of Barth's visit. The oldest part of the town is that which lies at the foot of the hill Dalá (120 feet), and from this the inhabited portion stretches south for 2½ miles to the walls. To the south of the great market-place lies a deep pond, Jakara, upwards of a mile and a half in length. Two kinds of dwelling-houses are common—square-shaped clay-built structures with flat roofs, and round huts with conical tops. The population, estimated at 50,000, consists of Fellatah, Kanuri (Bornuese), Houssas, and Nupe. Commerce and manufactures go hand in hand, and every family has its share in each. Cotton cloth, woven and dyed in the town, forms a chief article of trade; and to this may be added sandals and shoes, twisted leather straps, and *jebiras* (purses of a peculiar make), kola-nuts, and slaves. About 20,000 loads of natron pass through the town in a year from Bornu to Nupe.

See Clapperton's *Travels*, vol. ii.; and Barth, *Travels in North and Central Africa*, vol. ii. The latter gives a sketch plan of Kano.

KANSAS, the central state of the American Union, lies between 37° and 40° N. lat. and between 94° 38′ and 102° W. long. It is bounded on the N. by Nebraska, on the E. by Mis- Plate XIII.

souri, on the S. by Indian territory, and on the W. by Colorado. The State is nearly rectangular in shape, with a breadth of about 210 miles from north to south, and a length of 400 miles from east to west. It contains an area of 81,318 square miles, or 52,043,520 acres.

Kansas is an undulating plain, gently sloping from west to east, at an average of nearly 7 feet per mile. There is also an inclination from north to south, as indicated by the course of the rivers, which flow southerly as well as easterly, but never northerly or westerly, except for short distances from local causes. The mouth of the Kansas river, at the east line of the State, is 750 feet above the sea-level; the average altitude of the western boundary is about 3500 feet. The broad prairie surface is diversified by an endless succession of valleys and woodlands. The great central valley is traversed by the Kansas or Kaw river, which, inclusive of the Smokyhill branch, extends the entire length of the State. Lateral valleys on the north are formed by the Saline, Solomon, Republican, and Blue rivers, and other smaller streams. Another broad valley is formed in the southern half of the State by the Arkansas river, with lateral valleys on the north, traversed by the Walnut, Little Arkansas, Pawnee Fork, and other streams. The southeastern portion contains the important Neosho valley, and the smaller valleys of the Osage and Verdigris. In the extreme southwest and along the southern boundary are the valley of the Cimarron, and a network of the southern tributaries of the Arkansas. Numerous small affluents of the Missouri enrich and diversify the northeastern quarter of the State. The streams of Kansas are usually fed by perennial springs, and as a rule, the eastern and middle portions of the State are well watered. The western part is more elevated, and water is less abundant.

Geology and Minerals.—The surface presents three distinct geological sections. The eastern portion of the State belongs to the Carboniferous system, in which are found inexhaustible beds of valuable bituminous coal, often at shallow depths or cropping out on the surface. The central portion belongs to the Triassic formation, with magnesian limestone, ferruginous sandstone, and gypsum as the representative rocks. Magnesian limestone, known as dolomite, is especially plentiful along the Blue, Republican, and Neosho rivers and their tributaries. This beautiful stone, resembling white, gray, and cream-colored marble, is exceedingly useful for building purposes. It crops out in the bluffs in endless quantities, and is easily worked. The western portion of the State belongs to the Cretaceous formation, in which chalks and a species of native quicklime are very prominent in the river bluffs. The white and cream-colored chalks are much used for building purposes, but the blue is usually too soft for exposure to the weather. The quicklime as quarried from the bluffs slakes perfectly, and with sand makes a fairly good mortar, without calcination or other previous preparations. Lead-mines are extensively worked in the southeastern portion of the State, and prosperous towns and cities are growing up in connection with these mines. In the central region, salt is produced from wells, and appears in occasional marshes. Salt industries are carried on at Solomon City, near the mouth of the Solomon river, and an excellent brine is obtained at Junction City. The salt of the southwest is found in beds and dry incrustations, varying in thickness from a few inches to 2 feet. The salts of Kansas are remarkably free from lime and other impurities. Gypsum is found in beautiful crystalline form in extensive quarries, but it has not been much utilized. The lignite found near the Colorado line makes a valuable domestic fuel.

Climate.—The climate of Kansas is exceptionally salubrious. Extremes of heat and cold occur, as in all open prairie countries, but as a rule the winters are dry and mild, while the summer heats are tempered by the perpetual prairie breezes. The summer nights are invariably cool and refreshing. The mean annual temperature at Fort Riley for twenty-three years ending December, 1874, has been 53°. The highest temperature there during the same period was 98° and the lowest 12° below zero. The average annual rainfall at the city of Lawrence for six years (1875–1880,) was 32.68 inches, the heaviest rainfalls occurring in May, June, July, and August, the lightest in November, December, January, and February.

Soil.—The soil of the upland prairies is generally a deep rich clay loam, of a dark color. The bottom lands near the streams are a black sandy loam; and the intermediate lands, or "second bottoms," show a rich and deep black loam, containing very little sand. These soils are all easily cultivated, free from stones, and exceedingly productive. There are exceptional spots on the upland prairies composed of stiff clay, not as easily cultivated, but very productive when properly managed and enriched. In the early history of the country the prairies were covered with the short "buffalo grass," very nutritious for pasturage, on which immense herds of buffalo and other animals subsisted, but utterly unfit for hay. With the disappearance of the buffalo, and as the country is settled and cultivated, the short buffalo grass gives place to the tall blue stem and other bladed grasses valuable alike for pasture and for hay. Timber is abundant along the streams in the eastern section of the State, but is less plentiful in the central portion, and very scarce in some parts of the west. The varieties of timber embrace oak, elm, black walnut, cottonwood, mulberry, box, elder, willow, hickory, sycamore, white ash, and other hard and soft woods.

Agriculture.—The farm products of 1880 were as follows:—Indian corn, 101,420,718 bushels; winter wheat, 23,507,223; spring wheat, 1,772,661; rye, 676,507; oats, 11,483,796; barley, 287,057; buckwheat, 43,455; Irish potatoes, 4,919,227; sweet potatoes, 391,196; castor beans, 558,974; flax seed, 1,245,279; sorghum syrup, 3,787,585 gallons; cotton, 142,517 lb; hemp, 635,872 lb; millet and Hungarian hay, 629,084 tons; Timothy hay, 79,634 tons; hay from wild or native grasses, 798,707 tons; clover pasture, 5927 acres; blue grass pasture, 38,259 acres; native grass pasture, 901,125 acres; produce of market gardens to the value of $449,797.

The bright climate and pure atmosphere are admirably adapted to the growth of the apple, pear, peach, plum, grape, and cherry. The smaller fruits also, with scarce an exception, flourish finely. Trees never suffer from sodden or water-soaked roots, and very seldom from the winter's cold, when reasonable judgment and care have been exercised in selecting and managing the grounds. At a national exhibition in Philadelphia, in 1869, the great gold medal of the National Pomological Society was awarded to Kansas "for a collection of fruits unsurpassed for size, perfection, and flavor;" and similar awards have been made to Kansas fruits at later exhibitions. In November, 1872, the American Institute, at its great show, awarded a diploma for 190 varieties of apples grown in Kansas, as the largest and handsomest exhibited. At the International Exhibition at Philadelphia, in 1876, Kansas exhibited ninety-six varieties of apples, and received the diploma of the centennial commission. Estimates based on the tables of 1877 indicate that the number of bearing trees now in the State (1881) is about as follows:—2,500,000 apple, 100,000 pear, 8,000,000 peach, 200,000 plum, and 1,000,000 cherry trees. The planting of trees is still on the increase, and the older orchards are very profitable. The same is true of vineyards and plantations of small fruits.

Live Stock.—The wide prairies, with their nutritious grasses for hay and grazing and their never-failing springs of pure water, make the State a very paradise to the herdsman and stock-raiser. The following are the statistics for 1880:—horses, 367,589; mules and asses, 58,303; milch cows, 366,640; other horned cattle, 748,672; sheep, 426,492; swine, 1,231,630; value of animals slaughtered and sold for slaughter, $12,700,045; value of poultry and eggs sold, $531,550; wool (clip of 1878), 289,644 lb; wool (1879), 1,194,453 lb; honey (produce of 1879), 370,398 lb; wax (1879), 10,949 lb. The great herds of buffalo which formerly overran the plains have disappeared, the elk is gone, and deer and other game are less plentiful than formerly.

There remain, however, the rabbit, hare, turkey, prairie hen, quail, and the usual variety of migratory water-fowl, to gratify the sportsman. The numerous streams are well supplied with fish of choice varieties and of unusually large size.

Manufactures.—There is perhaps no tract of country of equal extent better supplied with available water power than Kansas. The streams are fed by living springs, and the inclination of the country insures uniformly rapid currents. Most of the streams maintain a good flow of water in the driest seasons, and in case of heavy rains many of them "underflow" the adjacent bottom lands, saturating the permeable substratum of the country with the surplus water, which in time drains out and feeds the subsiding streams. This feature is particularly true of the Saline, Solomon, and Smokyhill rivers. The Smokyhill river has not risen above the banks of its deep channel at Junction City since 1869, while at the lowest stages it is capable of driving large flouring-mills, having half a dozen sets of burrs. A dam on the Kansas river at Lawrence supplies a water-power capable of developing a great manufacturing centre. In 1870 there were one hundred and ten improvements of water-power in the State. Estimates based on the latest statistics now place the number of utilized mill sites at about three hundred, where flouring-mills, saw-mills, planing-mills, and woolleu-mills run the entire year, with very little hindrance from either high or low water. In the eastern section of the State, where coal is plentiful, steam-power is much used, especially in the manufacture of iron. At Leavenworth there are manufactories of iron bridges, engines, boilers, stoves, railroad iron, and miner's tools. There are also manufactories of wagons, carriages, carpets, soaps, paints, and cement, at Leavenworth, Fort Scott, Lawrence, Columbus, Ottawa, and other places. At Topeka, Parsons, Armstrong, and Argentine there are rolling mills and railroad repair shops, while planing-mills, tanneries, cheese factories, and pork-packing establishments are found in various localities.

Transport and Trade.—There are numerous railroads in the State, with an aggregate length of complete track of 3104 miles. The central branch in the north and the Union Pacific (Kansas division) near the centre traverse the northern half of the State from east to west, in nearly parallel lines—the latter extending by its connections to San Francisco. The Atchison, Topeka, and Santa Fe line passes from the northeast to the southwest, extending through to the Pacific coast; and the Missouri Pacific (Kansas division), by uniting with the Texas Central, connects the richest portion of Kansas with the Gulf of Mexico at Galveston. Other lines in connection with these facilitate the internal commerce of the State. Kansas has an eastern front of 150 miles on the Missouri river, which is navigable for steamboats of all sizes. The internal rivers of the State are not utilized for commercial purposes, though the Kansas was formerly considered navigable to Fort Riley, near the mouth of the Republican river, and steamboats have ascended the Smokyhill to the mouth of the Saline, about 50 miles farther west. By means of these railroads and the Missouri river immense quantities of wheat, corn, cattle, and swine are sent from Kansas to the eastern markets; flour is sent south, southwest, and west, and butter, poultry, and eggs, with large quantities of vegetables, hay, and garden produce, to the western mining regions.

Education.—The public schools are liberally endowed and supported. Two sections of land (1280 acres) are set apart in each township of 36 sq. miles for school fund purposes. There are in the State 5242 public school buildings, and the value of public school property is $4,633,044. The teachers employed number 6707. The pupils of school age are estimated from statistics of 1875 at 230,000, about half of whom are in actual attendance. The annual expenditure for school purposes, estimated from statistics of 1875, is $1,500,000. The State supports a university at Lawrence, and a normal school at Emporia; and the agricultural college at Manhattan is endowed by the general Government. There are also State institutions for the education of the blind, and the deaf and dumb, and for the care of the insane. A reform school for juvenile offenders is being built at the State capital.

Religion.—All the usual religious denominations are represented, owning church property to the amount of $2,511,520.

Administration.—In Kansas, as in all the States of the American Union, the government is vested in three departments, legislative, executive, and judicial. The governor is elected for a term of two years. The legislature consists of a senate and house of representatives. The members of the house are elected for two years, and members of the senate for four. The judiciary consists of a State supreme court and subordinate district courts. The judges are all elected by a direct vote of the people.

Population.—The following table gives the population at the last three census enumerations, with the number of inhabitants per square mile at each period:—

	Total.	Males.	Females.	Per Sq. Mile.
1860	107,206	59,178	48,028	1.3
1870	364,399	202,224	162,175	4.5
1901	1,470,495	768,716	701,979	12.2

The State is divided into 104 counties. The following are the largest towns, with population in 1880:—Leavenworth, 16,550; Topeka, 15,451; Atchison, 15,106; Lawrence, 8511; Wyandotte, 6149; Fort Scott, 5372; Wichita, 4911; Emporia, 4632; Parsons, 4196; Ottawa, 4032. Topeka, the State capital, is advantageously situated, and is one of the most flourishing towns in the State.

History.—Kansas belongs to that immense tract of country, purchased by the American Government from France in 1803, known as the Louisiana purchase. Prior to 1854 it was in the hands of various Indian tribes, some native, and others which had been removed from the older States. It was organized and opened for settlement as a territory by Act of Congress in May, 1854, in the midst of a heated contest on the slavery question. The slaveholders and the friends of freedom at once began a vigorous contest for the occupancy and control of the new territory, and thus it was that Kansas became the vanguard in the great struggle which resulted in the overthrow of slavery in the United States. Before the formal beginning of the war, societies were organized by the rival settlers and their friends in the States on both sides of the slavery question, and even rival legislatures were elected and convened. The discussions frequently resulted in personal violence, and the greatest excitement prevailed till the breaking out of the civil war. Kansas was admitted into the Union as a State in January, 1861, and took an active part in furnishing troops for the suppression of the rebellion. The State was frequently invaded, and the city of Lawrence was sacked and burned in August, 1863. Since the overthrow of slavery, Kansas has shared fully in the general progress of the country. (J. D.†)

KANSAS CITY, in Jackson county, Missouri, U. S., the second city in size and importance in the State, is situated on the right bank of the Missouri immediately below the mouth of the Kansas river, 235 miles west by north of St. Louis. It is a large railroad centre, several important lines meeting there, and giving the city large facilities for commanding the trade of western Missouri, Kansas, northern Texas, and part of Colorado and New Mexico. The Missouri at this point is crossed by a bridge 1387 feet long, resting on seven piers. The business in agricultural products is very large, and is constantly increasing, that of packing beef and pork being especially great, and growing with remarkable rapidity. The city was laid out in 1830, but its growth may be said to date from 1860, when its population numbered 4418. In 1870 the population had increased to 32,290, and in 1900 it was 163,762.

KANT, Immanuel (1724–1804). So far as changes of external fortune are concerned, the life of the greatest philosopher of the 18th century presents little or nothing of interest. Born in humble circumstances, he passed a quiet and almost undisturbed existence within the narrow limits of his native place. Education, both of school and university, he obtained at Königsberg, and during a prolonged academic activity in that retired Prussian town he gave forth the works which have exercised such influence on European thought that, in the estimation of the best historical judges, they may be placed on a level with the great events of the French Revolution as the most important factors in determining the characteristic features of 19th century culture. A biography of Kant can be little more than a record of the successive phases of his literary activity.

The family of Kant was of Scotch extraction, the grandfather of the philosopher having been an emigrant from Scotland who had settled, first at Memel, and afterwards at Tilsit. The name Cant, as it was

originally spelled, is not uncommon in the north of Scotland, whence the family is said to have come, and it is not perhaps mere fancy to trace in some of the ethical doctrines of the critical philosophy and in the personal character of its author some of the prominent features of Scottish nationality. The father of the philosopher carried on the business of a saddler in Königsberg, and in that town, on the 22d April, 1724, was born Immanuel, the fourth of a large family, most of whom died at an early age. Königsberg was then somewhat noted as a stronghold of what is known as Pietism, a phase of religious thought and life which had in Germany, as elsewhere, too much that was unpleasing, but which nevertheless was capable of exercising a powerful influence for good on the development of a really strong and ample character. "Say what you will of Pietism," writes Kant to his friend Rink, "no one can deny the real worth of the characters which it formed; they possessed the highest that man can possess—a peace, a cheerfulness, an inner harmony with self, which was disturbed by no passion." To influences of this kind Kant was subjected in his early years, partly from his mother, for whose memory he ever cherished the warmest affection and regard, partly from his excellent friend and patron, Schulz, the director of the Collegium Fredericianum in Königsberg, and afterwards professor of theology in the university. At the Collegium Fredericianum Kant was entered in his tenth year, with the definite view of proceeding to the theological courses of the university. His inclination at this time, determined probably by the high character of his teachers, was towards classics, and he was recognized, with his schoolfellow, the afterwards celebrated David Ruhnken, as among the most competent and promising classical scholars of the college. His taste for the greater Latin authors, particularly Lucretius, was never lost, and he acquired through his school training an unusual facility in Latin composition. With Greek authors he does not appear to have been equally familiar.

During his university course, which began in 1740, Kant was principally attracted towards mathematics and physics, doubtless through the influence of Knutzen, who then, as extraordinary professor, lectured on most branches of mathematics and also on philosophy. The lectures on classics do not seem to have satisfied Kant, and, though he attended Schulz's courses on theology, and even preached on one or two occasions, he appears finally to have given up the intention of entering the church. The last years of his university studies were much disturbed by the straitened means of his family, and he was compelled to have recourse to private teaching of the humblest kind. The death of his father, in 1746, destroyed his hopes of remaining at the university until he should have obtained some subordinate academic post. Much against his inclination he undertook the office of private tutor, and for nine years acted in this capacity in various families in the immediate neighborhood of Königsberg. Although the life was not one which Kant would have chosen, and one for which he was not specially qualified—as he used to say regarding the excellent precepts of his *Pædagogics*, he was never able to apply them—yet it gave him an extended knowledge of the world, and added to his other accomplishments the grace and polish of refined society, which he displayed ever afterwards to a degree somewhat unusual in a philosopher by profession.

In 1755 Kant returned to Königsberg as tutor in the family of Count Kayserling. By the kindness of a friend named Richter, he was enabled again to take up his university career, and in autumn of that year he graduated as doctor and qualified as "Privatdocent." Two of the theses publicly defended on the occasion are printed in his works; an address, on the easier and harder styles of philosophical exposition, has not been published. For fifteen years he continued to labor in this subordinate position, his fame as writer and lecturer steadily increasing. On two occasions he was disappointed in the hope of obtaining a professorship in his own university, but during this time, as in later years, he refused all offers that would have withdrawn him from Königsberg. The only academic preferment received by him during the lengthy probation was the post of under-librarian, to which he was appointed in 1766. His lectures, at first mainly upon physics, gradually expanded until nearly all descriptions of philosophy were included under them. A most interesting programme of his courses on metaphysics, logic, ethics, and physical geography for the session 1765–66 has been printed in his works (i. 289–299). The history of his literary activity during this period will be given in connection with the notice of his writings.

In 1770 he obtained the chair of logic and metaphysics at Königsberg, and delivered as his inaugural address the dissertation *De Mundi Sensibilis et Intelligibilis Forma et Principiis*. Eleven years later appeared the *Kritik of Pure Reason*, the work towards which he had been steadily advancing, and of which all his later writings are developments.

In 1783 he published the *Prolegomena*, intended as an introduction to the *Kritik*, which had been found to stand in need of some explanatory comment. A second edition of the *Kritik*, with some modifications, appeared in 1787, after which it remained unaltered.

In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of ten or twelve years from the publication of the *Kritik of Pure Reason*, it was expounded in all the leading universities, and it even penetrated into the schools of the Church of Rome. Such men as Schulze in Königsberg, Kiesewetter in Berlin, Jakob in Halle, Born and Heydenreich in Leipsic, Reinhold and Schmid in Jena, Buhle in Göttingen, Tennemann in Marburg, and Snell in Geissen, with many others, made it the basis of their philosophical teaching, while theologians like Tieftrunk, Stäudlin, and Ammon eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian Government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry,—as, for example, on the lawfulness of inoculation for the small-pox. This universal homage for a long time left Kant unaffected; it was only in his later years that he spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable was his review of Herder's *Philosophy of History*, which greatly exasperated that author, and led to a violent act of retaliation some years after in his *Metakritik of Pure Reason*. Schiller at this period in vain sought to engage Kant upon his *Horen*. He remained true to the *Berlin Journal*, in which most of his criticisms appeared.

In 1792 Kant, in the full height of his reputation, was involved in a painful collision with the Government on the question of his religious doctrines. Wöllner had replaced Von Zedlitz as minister of spiritual affairs, and, in an age peculiarly lax and heterodox, an unwise attempt was made to apply a rigid censorship to works of philosophical theology. It was not wonderful that the philosophy of Kant had excited the declared opposition of all adherents of historical Christianity, since its plain tendency was towards a moral rationalism, and it could not by any process of interpretation be reconciled to the literal doctrines of the Lutheran Church. It would have been much better to permit his exposition of the philosophy of religion to enjoy the same literary rights as his earlier works, since Kant could not be interdicted without first

silencing a multitude of theologians who were at least equally separated from positive Christianity. The Government, however, judged otherwise; and after the first part of his book, *On Religion within the Limits of Reason alone*, had appeared in the *Berlin Journal*, the publication of the remainder, which treats in a more rationalizing style of the peculiarities of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university, published the full work in Königsberg. The Government, who were probably as much influenced by hatred and fear of the French Revolution, of which Kant was supposed to be a partisan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting from him a pledge not to lecture or write at all on religious subjects in future. With this mandate Kant, after a struggle, complied, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. This incident, however, produced a very unfavorable effect on his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased altogether his public labors, after an academic course of forty-two years. He previously, in the same year, finished his treatises on the *Metaphysics of Ethics*, which, with his *Anthropology*, completed in 1798, were the last considerable works that he revised with his own hand. His *Lectures on Logic*, on *Physical Geography*, on *Pædagogics*, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his *Strife of the Faculties*, in which all the strongest points of his work on religion were urged afresh, and the correspondence that had passed between himself and his censors was given to the world.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His memory began to fail, and a large work at which he wrought night and day, on the connection between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs, attended with frequent fits of falling, he mitigated a little the Spartan severity of his life, and also consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words "I have not yet lost my feeling for humanity." On the 12th of February, 1804, he breathed his last, having almost completed the eightieth year of his age.

It is superfluous to characterize the genius of Kant; but a few words may be added as to his personal appearance and habits of life, study, and teaching. His stature was small and his appearance feeble. He was little more than 5 feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His hair was light, his complexion fresh, his forehead high and square, while his eye of light blue showed an expression of unusual depth and power. His senses were quick and delicate; and, though of weak constitution, he escaped, by strict regimen, all serious illness till the close of life.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant awoke him summer and winter at five o'clock; and, on being appealed to on one occasion, testified that Kant had not once failed in thirty years to respond to the call. After rising he studied for two hours, then lectured other two, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of strangers, who crowded to see and hear him—till in later years his growing means enabled him to invite a friend or two daily to his own home. This was his only regular meal; and, as he loved the *ducere cœnam* of the Romans, he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weathers, and spent the evening in lighter reading, except an hour or two devoted to the preparation of his next day's lectures, after which he retired between nine and ten to rest. The furniture of his house was of the simplest character; and, though he left a considerable sum, the produce of his writings, to his relatives, he indulged in no luxury, and was a pattern of that superiority to fashion and appearance so often met with in the literary life of Germany. In his earlier years he often spent his evenings in general society, where his overflowing knowledge and conversational talents made him the life of every party. He was especially intimate with the families of two English merchants of the name of Green and Motherby, where he found many opportunities of meeting ship-captains, and other travelled persons, and thus gratifying his passion for physical geography. This social circle included also the celebrated Hamann—the Magus or Wizard of the North—the friend of Herder and Jacobi, who was thus a mediator between Kant and these philosophical adversaries.

Kant's reading was of the most extensive and miscellaneous kind. He cared comparatively little for the history of speculation, being in this department more a discoverer than a scholar. But his acquaintance with books of science, general history, travels, and belles lettres was boundless. He was well versed in English literature, chiefly of the age of Queen Anne, and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but had little or no acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his *Kritik*, but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge. He was excessively fond of newspapers and works on politics; and this was the only kind of reading that could interrupt his studies in philosophy.

As a lecturer, Kant avoided altogether that rigid style in which his books were written, and which was only meant for thinkers by profession. He sat behind a low desk, with a few jottings on slips of paper, or text-books marked on the margin, before him, and delivered an extemporaneous address, opening up the subject by partial glimpses, and with many digressions and interspersed anecdotes or familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Like Adam Smith, he fixed his eye on one student, and marked by his countenance whether the lecture was understood. The least irregularity in the appearance or dress of this selected hearer disconcerted him; and the story is well known of the missing button, which defeated a lecture. Though kind to his students, he refused on principle to remit their fees, as this, he thought, would discourage independence. It was another principle that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the dunces were beyond remedy. Hence he never delivered his deeper doctrines, such as are found in his *Kritik*, from the chair. His other avocations allowed him little personal intercourse with his numerous hearers, and he often complained of the

want of lively sympathy and ascertained progress inseparable from such a system.

Simple, honorable, truthful, kind-hearted, and high-minded as Kant was in all moral respects, he was somewhat deficient in the region of sentiment. He had little enthusiasm for the beauties of nature, and indeed never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. Though faithful in a high degree to the duties of friendship, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory. His engrossing intellectual labors no doubt tended somewhat to harden his character; and in his zeal for rectitude of purpose he forgot the part which affection and sentiment must ever play in the human constitution. Those who count these defects most grave will yet find much to admire in the lofty tone of his character, and in the benevolence which could thus express itself: "Whoever will suggest to me a good action left undone, him will I thank, though he suggest it even in my last hour!"

This brief notice of his life may appropriately close with Herder's beautiful sketch of Kant's character, all the more interesting that it was written in 1795, after their quarrel:—"I have had the good fortune to know a philosopher who was my teacher. In the vigor of life he had the same youthful gaiety of heart that now follows him I believe into old age. His open forehead, built for thought, was the seat of imperturbable cheerfulness and joy; the most pregnant discourse flowed from his lips, wit, humor, and raillery came to him at will, and his instructions had all the charm of an entertainment. With the same easy mastery with which he tested the doctrines of Leibnitz, Wolf, Baumgarten, Crusius, and Hume, or pursued the discoveries of Newton, Kepler, and other lights of science, he also took up the current writings of Rousseau, such as the *Émile* or *Héloise*, or any new phenomenon of the natural world, and from the criticism of each came back to the impartial study of nature, and to the enforcement of the dignity of man. History in all its branches, natural science, physics, mathematics, and experience were the materials that gave interest to his lectures and his conversation; nothing worthy of study was to him indifferent; no faction or sect, no selfishness or vanity, had for him the least attraction, compared with the extension and elucidation of truth. He excited and pleasantly impelled us to mental independence; despotism was foreign to his nature. This man, whom I name with the deepest gratitude and respect, is Immanuel Kant; his image rises before me surrounded with pleasing recollections."

The Writings of Kant.

From the preceding sketch of Kant's academic activity it must be evident that he combined in a quite unusual degree knowledge of physical science with speculative acuteness and devotion to the special work of philosophy. No other thinker of modern times has been throughout his work so penetrated with the fundamental conceptions of physical science; no other has been able to hold with such firmness the balance between empirical and speculative ideas. Beyond all question much of the influence which the critical philosophy has exercised and continues to exercise must be ascribed to this characteristic feature in the training of its great author.

The early writings of Kant are almost without exception on questions of physical science. It was only by degrees that philosophical problems began to engage his attention, and that the main portion of his literary activity was turned towards them. It will be convenient, therefore, in enumerating the varied writings of Kant, to place in a separate group those which bear directly on physical science. The following are the most important in this group:—

1. *Thoughts on the True Estimate of Vis Viva*, 1747: an essay dealing with the famous dispute between the Cartesians and Leibnitzians regarding the expressions for the *amount of a force*. According to the Cartesians, this quantity was directly proportional to velocity; according to their opponents, it varied with the square of the velocity. The dispute has now lost its interest, for physicists have learned to distinguish accurately the two quantities which are vaguely included under the expression *amount of force*, and consequently have been able to show in what each party was correct and in what it was in error. Kant's essay, with some fallacious explanations and divisions, criticizes acutely the arguments of the Leibnitzians, and concludes with an attempt to show that both modes of expression are correct when correctly limited and interpreted.

2. *Whether the Earth in its Revolution has experienced some Change since the Earliest Times*, 1754. In this brief essay Kant throws out a notion which has since been carried out, in ignorance of Kant's priority, by Delaunay (1865) and Adams. He points out that the action of the moon in raising the waters of the earth must have a secondary effect in the slight retardation of the earth's motion, and refers to a similar cause the fact that the moon turns always the same face to the earth.

3. *General History and Theory of the Heavens* ("Allgemeine Natur-Geschichte und Theorie des Himmels"), published anonymously in 1755. In this remarkable work Kant, proceeding from the Newtonian conception of the solar system, extends his consideration to the entire sidereal system, points out how the whole may be mechanically regarded, and throws out the important speculation which has since received the title of the nebular hypothesis. In some details, such, *e.g.*, as the regarding of the motion of the entire solar system as portion of the general cosmical mechanism, he had predecessors, among others J. Wright of Durham, but the work as a whole contains a wonderfully acute anticipation of much that was afterwards carried out by Herschel and Laplace. The hypothesis of the original nebular condition of the system, with the consequent explanation of the great phenomena of planetary formations and movements of the satellites and rings, is unquestionably to be assigned to Kant.

4. *Brief Account of some Thoughts on Fire* ("Meditationum quarundam de Igne succincta delineatio"), 1755; an inaugural dissertation, containing little beyond the notion that bodies operate on one another through the medium of a uniformly diffused, elastic, and subtle matter (ether) which is the underlying substance of heat and light. Both heat and light are regarded as vibrations of this diffused ether.

5. *On the Causes of Earthquakes*, 1755; *Description of the Earthquake of* 1755, 1756; *Consideration of some Recently Experienced Earthquakes*, 1756.

6. *Explanatory Remarks on the Theory of the Winds*, 1756. In this brief tract, Kant, apparently in entire ignorance of the explanation given in 1735 by Hadley, points out how the varying velocity of rotation of the successive zones of the earth's surface furnishes a key to the phenomena of periodic winds. His theory is in almost entire agreement with that now received. See the parallel statements from Kant's tract and Dove's essay on the influence of the rotation of the earth on the flow of its atmosphere, 1835, given in Zöllner's work, *Ueber die Natur der Cometen*, pp. 477–482.

7. *On the Different Races of Men*, 1775; *Determination of the Notion of a Human Race*, 1785; *Conjectural Beginning of Human History*, 1786: three tracts containing some points of interest as regards the empirical grounds for Kant's doctrine of teleology. Reference will be made to them in the notice of the *Kritik of Judgment*.

8. *On the Volcanoes in the Moon*, 1785; *On the Influence of the Moon on the Weather*, 1794. The second of these contains a remarkable discussion of the relation between the centre of the moon's figure and its centre of gravity. From the difference between these Kant is led to conjecture that the climatic conditions of the side of the moon turned from us must be altogether unlike those of the face presented to us. His views have been restated by Hansen.

9. *Lectures on Physical Geography*, 1822: published from notes of Kant's lectures, with the approval of the author.

Consideration of these works is sufficient to show that Kant's mastery of the science of his time was complete and thorough, and that his philosophy is to be dealt with as having throughout a reference to general scientific conceptions. For more detailed treatment of his importance in science, reference may be made to Zöllner's essay on "Kant and his Merits on Natural Science" contained in the work on the *Nature of Comets* (pp. 426–484); to Dietrich,

Kant and Newton; to Schultze, *Kant and Darwin;* and to Reuschle's careful analysis of the scientific works in the *Deutsche Vierteljahrs-schrift*, 1868.

The notice of the philosophical writings of Kant need not be more than bibliographical, as in the account of his philosophy it will be necessary to consider at some length the successive stages in the development of his thought. Arranged chronologically these works are as follows:—

1755. *Principiorum Primorum cognitionis Metaphysicæ nova Dilucidatio.*

1756. *Metaphysicæ cum geometria junctæ usus in philosophia naturali, cujus Specimen I. continet Monadologiam Physicam.*

1762. *Die falsche Spitzfindigkeit der vier syllogistischen Figuren,* "The False Subtlety of the Four Syllogistic Figures."

1763. *Versuch den Begriff der negativen Grössen in die Weltweisheit einzuführen,* "Attempt to introduce the Notion of Negative Quantities into Philosophy."

1763. *Der einzig mögliche Beweisgrund zu einer Demonstration des Daseins Gottes,* "The only possible Foundation for a Demonstration of the Existence of God."

1763. *Untersuchung über die Deutlichkeit der Grundsätze der natürlichen Theologie und Moral,* "Essay on the Evidence (Clearness) of the Fundamental Propositions of Natural Theology and Ethics."

1766. *Träume eines Geistersehers, erläutert durch Träume der Metaphysik,* "Dreams of a Ghost-seer (or Clairvoyant), explained by the Dreams of Metaphysic."

1768. *Von dem ersten Grunde des Unterschiedes der Gegenden im Räume,* "Foundation for the Distinction of Positions in Space."

The above may all be regarded as belonging to the pre-critical period of Kant's development. The following introduce the notions and principles characteristic of the critical philosophy.

1770. *De Mundi Sensibilis et Intelligibilis forma et principiis.*

1781. *Kritik der reinen Vernunft,* "Kritik of Pure Reason."

1783. *Prolegomena zu einer jeden künftigen Metaphysik die als Wissenchaft wird auftreten können,* "Prolegomena to all Future Metaphysic which may present itself as Science."

1784. *Idee zu einer allgemeinen Geschichte im weltbürgerlicher Absicht,* "Notion of a Universal History in a Cosmopolitan Sense." With this may be coupled the review of Herder in 1785.

1785. *Grundlegung der Metaphysik der Sitten,* "Foundations of the Metaphysic of Ethics."

1786. *Metaphysische Anfangsgründe der Naturwissenschaft,* "Metaphysical Elements of Natural Science."

1788. *Ueber den Gebrauch teleologischer Principien in der Philosophie,* "On the Employment of Teleological Principles in Philosophy."

1788. *Kritik der praktischen Vernunft,* "Kritik of Practical Reason."

1790. *Kritik der Urtheilskraft,* "Kritik of Judgment."

1790. *Ueber eine Entdeckung, nach der alle neue Kritik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll,* "On a Discovery by which all the recent Critique of Pure Reason is superseded by a more ancient (*i.e.*, by Leibnitz's philosophy)."

1791. *Ueber die wirklichen Fortschitte der Metaphysik seit Leibnitz und Wolff,* "On the Real Advances of Metaphysics since Leibnitz and Wolff.

1794. *Die Religion innerhalb der Grenzen der blossen Vernunft,* "Religion within the Bounds of Reason only."

1794. *Ueber Philosophie überhaupt,* "On Philosophy generally."

1797. *Metaphysische Anfangsgründe der Rechtslehre,* and *Metaphysische Anfangsgründe der Tugendlehre.*

1798. *Der Streit der Facultäten,* "Contest of the Faculties."

1798. *Anthropologie.*

The Kantian Philosophy.

Historians are accustomed to divide the general current of speculation into epochs or periods marked by the dominance of some single philosophic conception with its systematic evolution. Perhaps in no case is the character of an epoch more clearly apparent than in that of the critical philosophy. The great work of Kant absolutely closed the lines of speculation along which the philosophical literature of the 18th century had proceeded, and substituted for them a new and more comprehensive method of regarding the essential problems of thought, a method which has proscribed the course of philosophic speculation in the present age. The critical system has thus a twofold aspect. It takes up into itself what had characterized the previous efforts of modern thought, shows the imperfect nature of the fundamental notions therein employed, and offers a new solution of the problems to which these notions had been applied. It opens up a new series of questions upon which subsequent philosophic reflection has been directed, and gives to them the form, under which it is possible that they should be fruitfully regarded. A work of this kind is essentially epoch-making.

In any complete account of the Kantian system it is therefore necessary that there should be constant reference, on the one hand, to the peculiar character of the preceding 18th century philosophy, and, on the other hand, to the problems left for renewed treatment to more modern thought. Fortunately the development of the Kantian system itself furnishes such treatment as is necessary of the former reference. For the critical philosophy was a work of slow growth. In the early writings of Kant we are able to trace with great definiteness the successive stages through which he passed from the notions of the preceding philosophy to the new and comprehensive method which gives its special character to the critical work. Scarcely any great mind, it has been said with justice, ever matured so slowly. In the early essays we find the principles of the current philosophies, those of Leibnitz and English empiricism, applied in various directions to those problems which serve as tests of their truth and completeness; we note the appearance of the difficulties or contradictions which manifest the one-sidedness or imperfection of the principle applied; and we can trace the gradual growth of the new conceptions which were destined, in the completed system, to take the place of the earlier method. To understand the Kantian work it is indispensable to trace the history of its growth in the mind of its author.

Of the two preceding stages of modern philosophy, only the second, that of Locke and Leibnitz, seems to have influenced practically the course of Kant's speculation. With the Cartesian movement as a whole he shows little acquaintance and no sympathy, and his own philosophic conception is never brought into relation with the systematic treatment of metaphysical problems characteristic of the Cartesian method. The fundamental question for philosophic reflection presented itself to him in the form which it had assumed in the hands of Locke and his successors in England, of Leibnitz and the Leibnitzian school in Germany. The transition from the Cartesian movement to this second stage of modern thought had doubtless been natural and indeed necessary. Nevertheless the full bearings of the philosophic question were somewhat obscured by the comparatively limited fashion in which it was then regarded. The tendency towards what may be technically called subjectivism, a tendency which differentiates the modern from the ancient method of speculation, is expressed in Locke and Leibnitz in a definite and peculiar fashion. However widely the two systems differ in details, they are at one in a certain fundamental conception which dominates the whole course of their philosophic construction. They are throughout individualist, *i.e.*, they accept as given fact the existence of the concrete, thinking subject, and endeavor to show how this subject, as an individual conscious being, is related to the wider universe of which he forms part. In dealing with such a problem, there are evidently two lines along which investigation may proceed. It may be asked how the individual mind comes to know himself and the system of things with which he is connected, how the varied contents of his experience are to be accounted for, and what certainty attaches to his subjective consciousness of things. Regarded from the individualist point of view, this line of inquiry becomes purely psychological, and the answer may be presented, as it was presented by Locke, in the fashion of a natural history of the growth of conscious experience in the mind of the subject. Or, it may be further asked, how is the individual really connected with the system of things apparently disclosed to him in conscious experience? what is the precise significance of the existence which he ascribes both to himself and to the objects of experience? what is the nature of the relation between himself as one part of the system, and the system as a whole? This second inquiry is specifically metaphysical in bearing, and the kind of answer furnished to it by Leibnitz on the one hand, by Berkeley on the other, is in fact prescribed or determined beforehand by the fundamental conception of the individualist method with which both begin their investigations. So soon as we make clear to ourselves the essential nature of this method, we are able to discern the specific difficulties or perplexities arising in the attempt to carry it out systematically, and thus to note with precision the special problems presented to Kant at the outset of his philosophic reflections.

Consider, first, the application of the method on its psychological side, as it appears in Locke. Starting with the assumption of conscious experience as the content or

filling-in of the individual mind, Locke proceeds to explain its genesis and nature by reference to the real universe of things and its mechanical operation upon the mind. The result of the interaction of mind, *i. e.*, the individual mind, and the system of things, is conscious experience, consisting of ideas, which may be variously compounded, divided, compared, or dealt with by the subjective faculties or powers with which the entity, Mind, is supposed to be endowed. Matter of fact and matter of knowledge are thus at a stroke dissevered. The very notion of relation between mind and things leads at once to the counter notion of the absolute restriction of mind to its own subjective nature. That Locke was unable to reconcile these opposed notions is not surprising; that the difficulties and obscurities of the *Essay* arise from the impossibility of reconciling them is evident on the slightest consideration of the main positions of that work. Of these difficulties the philosophies of Berkeley and Hume are systematic treatments. In Berkeley we find the resolute determination to accept only the one notion, that of mind as restricted to its own conscious experience, and to attempt by this means to explain the nature of the external reality to which obscure reference is made. Any success in the attempt is due only to the fact that Berkeley introduces alongside of his individualist notion a totally new conception, that of mind itself as not in the same way one of the matters of conscious experience, but as capable of reflection upon the whole of experience and of reference to the supreme mind as the ground of all reality. It is only in Hume that we have definitely and completely the evolution of the individualist notion as groundwork of a theory of knowledge; and it is in his writings, therefore, that we may expect to find the fundamental difficulty of that notion clearly apparent. It is not a little remarkable that we should find in Hume, not only the skeptical dissolution of all fixity of cognition, which is the inevitable result of the individualist method, but also the clearest consciousness of the very root of the difficulty. The systematic application of the doctrine that conscious experience consists only of isolated objects of knowledge, impressions or ideas, leads Hume to distinguish between truths reached by analysis and truths which involve real connection of the objects of knowledge. The first he is willing to accept without further inquiry, though it is an error to suppose, as Kant seems to have supposed, that he regarded mathematical propositions as coming under this head (see HUME); with respect to the second, he finds himself, and confesses that he finds himself, hopelessly at fault. No real connections between isolated objects of experience are perceived by us. No single matter of fact necessarily implies the existence of any other. In short, if the difficulty be put in its ultimate form, no existence thought as a distinct individual can transcend itself, or imply relation to any other existence. If the parts of conscious experience are regarded as so many distinct things, there is no possibility of connecting them other than contingently, if at all. If the individual mind be really thought as individual, it is impossible to explain how it should have knowledge or consciousness at all, "In short," says Hume, "there are two principles which I cannot render consistent, nor is it in my power to renounce either of them, viz., *that all our distinct perceptions are distinct existences*, and *that the mind never perceives any real connection among distinct existences*. Did our perceptions either inhere in something simple or individual, or did the mind perceive some real connection among them, there would be no difficulty in the case" (App. to *Treatise of Human Nature*).

Thus, on the one hand, the individualist conception, when carried out to its full extent, leads to the total negation of all real cognition. If the real system of things, to which conscious experience has reference, be regarded as standing in causal relation to this experience, there is no conceivable ground for the extension to reality of the notions which somehow are involved in thought. The same result is apparent, on the other hand, when we consider the theory of knowledge implied in the Leibnitzian individualism. The metaphysical conception of the monads, each of which is the universe *in nuce*, presents insuperable difficulties when the connection or interdependence of the monads is in question, and these difficulties obtrude themselves when the attempt is made to work out a consistent doctrine of cognition. For the whole mass of cognizable fact, the *mundus intelligibilis*, is contained *impliciter* in each monad, and the several modes of apprehension can only be regarded as so many stages in the developing consciousness of the monad. Sense and understanding, real connection of facts and analysis of notions, are not, therefore, distinct in kind, but differ only in degree. The same fundamental axioms, the logical principles of identity and sufficient reason, are applicable in explanation of all given propositions. It is true that Leibnitz himself did not work out any complete doctrine of knowledge, but in the hands of his successors the theory took definite shape in the principle that the whole work of cognition is in essence analytical. The process of analysis might be complete or incomplete. For finite intelligences there was an inevitable incompleteness so far as knowledge of matters of fact was concerned. In respect to them, the final result was found in a series of irreducible notions or categories, the *prima possibilia*, the analysis and elucidation of which was specifically the business of philosophy or metaphysics.

It will be observed that, in the Leibnitzian as in the empirical individualism, the fundamental notion is still that of the abstract separation of the thinking subject from the materials of conscious experience. From this separation arise all the difficulties in the effort to develop the notion systematically, and in tracing the history of Kant's philosophical progress we are able to discern the gradual perception on his part that here was to be found the ultimate cause of the perplexities which became apparent in considering the subordinate doctrines of the system. The successive essays which have already been enumerated as composing Kant's precritical work are not to be regarded as so many imperfect sketches of the doctrines of the *Kritik*, nor are we to look in them for anticipations of the critical view. They are essentially tentative, and exhibit with unusual clearness the manner in which the difficulties of a received theory force on a wider and more comprehensive view. There can be no doubt that some of the special features of the *Kritik* are to be found in these precritical essays, *e. g.*, the doctrine of the *Aesthetik* is certainly foreshadowed in the *Dissertation* of 1770; the *Kritik*, however, is no patchwork, and what appears in the *Dissertation* takes an altogether new form when it is wrought into the more comprehensive conception of the later treatise.

The particular problem which gave the occasion to the first of the precritical writings is, in an imperfect or particular fashion, the fundamental question to which the *Kritik* is an answer. What is the nature of the distinction between knowledge gained by analysis of notions and knowledge of matters of fact? Kant seems never to have been satisfied with the Wolffian identification of logical axioms and of the principle of sufficient reason. The tract on the *False Subtlety of the Four Syllogistic Figures*, in which the view of thought or reason as analytic is clearly expressed, closes with the significant division of judgments into those which rest upon the logical axioms of identity and contradiction and those for which no logical ground can be shown. Such immediate or indemonstrable judgments, it is said, abound in our experience. They are, in fact, as Kant presently perceived, the foundations for all judgments regarding real existence. It was impossible that the question regarding their nature and legitimacy and their distinction from analytic judgments should not present itself to him. The three tracts belonging to the years 1763–64 bring forward in the sharpest fashion the essential opposition between the two classes of judgments. In the *Essay on Negative Quantities*, the fundamental thought is the total distinction in kind between logical opposition (the contradictoriness of notions, which Kant always viewed as formed, definite products of thought) and real opposition. For the one the adequate explanation is found in the logical axiom of analytical thinking; for the other no such explanation is to be had. Logical ground and real ground are totally distinct. "I can understand perfectly well," says Kant, "how a consequence follows from its reason according to the law of identity, since it is discoverable by mere analysis of the notion contained in it. . . . But how something follows from another thing and not according to the law of identity, this I should gladly have made clear to me. . . . How shall I comprehend that, since something is, something else should be?" Real things, in short, are distinct existences, and, as distinct, not necessarily or logically connected in thought. "I have," he proceeds, "reflected on the nature of our knowledge in relation to our judgments of reason and consequent, and I intend to expound fully the result of my reflections. It follows from them that the relation of a real ground to that which is thereby posited or denied cannot be expressed by a judgment but only by means of a notion, which by analysis may certainly be reduced to yet simpler notions of real grounds, but yet in such a way that the final resort of all our cognition in this regard must be found in simple and irreducible notions of real grounds, the relation of which to their consequents cannot be made clear."

The striking similarity between Kant's expressions in this *Essay* and the remarks with which Hume introduces his analysis of the notion of cause has led to the supposition

that at this period of his philosophical career Kant was definitely under the influence of the earlier empirical thinker. Consideration of the whole passage is quite sufficient to show the groundlessness of this supposition. The difficulty with which Kant is presented was one arising inevitably from reflection upon the Leibnitzian theory of knowledge, and the solution does not in any way go beyond that theory. It is a solution, in fact, which must have been impossible had the purport of Hume's empirical doctrine been present to Kant's mind. He is here at the point at which he remained for many years, accepting without any criticism certain fundamental notions as required for real cognition. His ideal of metaphysic is still that of complete analysis of given notions. No glimmering of the further question, Whence come these notions and with what right do we apply them in cognition? is yet apparent. Any direct influence from Hume must be referred to a later period in his career.

The prize essay *On the Principles of Natural Theology and Morals* brings forward the same fundamental opposition,—though in a special form. Here, for the first time, appears definitely the distinction between synthesis and analysis, and in the distinction is found the reason for the superior certainty and clearness of mathematics as opposed to philosophy. Mathematics, Kant thinks, proceeds synthetically, for in it the notions are constructed. Metaphysics, on the other hand, is analytical in method; in it the notions are given, and by analysis they are cleared up. It is to be observed that the description of mathematics as synthetic is not an anticipation of the critical doctrine on the same subject. Kant does not, in this place, raise the question as to the reason for assuming that the arbitrary syntheses of mathematical construction have any reference to reality. The deeper significance of synthesis has not yet become apparent.

In the *Only Possible Ground of Proof for the Existence of God*, the argument, though largely Leibnitzian, advances one step further towards the ultimate inquiry. For there Kant states as precisely as in the critique of speculative theology his fundamental doctrine that real existence is not a predicate to be added in thought to the conception of a possible subject. So far as subjective thought is concerned, possibility, not real existence, is contained in any judgment.

The year 1765 was marked by the publication of Leibnitz's posthumous *Nouveaux Essais*, in which his theory of knowledge is more fully stated than in any of his previous tracts. In all probability Kant gave some attention to this work, though no special reference to it occurs in his writings, and it may have assisted to give additional precision to his doctrine. In the curious essay, *Dreams of a Clairvoyant*, published 1766, he emphasizes his previously reached conclusion that connections of real fact are mediated in our thought by ultimate notions, but adds that the significance and warrant for such notions can be furnished only by experience. He is inclined, therefore, to regard as the function of metaphysics the complete statement of these ultimate, indemonstrable notions, and therefore the determination of the limits to knowledge by their means. Even at this point, where he approximates more closely to Hume than to any other thinker, the difficulty raised by Hume does not seem to occur to him. He still appears to think that experience does warrant the employment of such notions, and when there is taken into account his correspondence with Lambert during the next few years, one would be inclined to say that the *Architektonik* of the latter represents most completely Kant's idea of philosophy.

On another side Kant had been shaking himself free from the principles of the Leibnitzian philosophy. According to Leibnitz, space, the order of coexisting things, resulted from the relations of monads to one another. But Kant began to see that such a conception did not accord with the manner in which we determine directions or positions in space. In the curious little essay, *On the Ground of distinguishing Particular Divisions in Space*, he pointed out that the idea of space as a whole is not deducible from the experience of particular spaces, or particular relations of objects in space, that we only cognize relations in space by reference to space as a whole, and finally that definite positions involve reference to space as a given whole.

The whole development of Kant's thought up to this point is intelligible when regarded from the Leibnitzian point of view, with which he started. There appears no reason to conclude that Hume at this time exercised any direct influence. One may go still further, and add that even in the *Dissertation* of 1770, generally regarded as more than foreshadowing the *Kritik*, the really critical question is not involved. A brief notice of the contents of this tract will suffice to show how far removed Kant yet was from the methods and principles of the critical or transcendental philosophy. Sense and understanding, according to the *Dissertation*, are the two sources of knowledge. The objects of the one are things of sense or *phenomena;* the objects of the other are *noumena*. These are absolutely distinct, and are not to be regarded as differing only in degree. In *phenomena* we distinguish *matter*, which is given by sense, and *form*, which is the law of the order of sensations. Such form is twofold—the order of space and time. Sensations formed by space and time compose the world of appearance, and this when treated by the understanding, according to logical rules, is *experience*. But the logical use of the understanding is not its only use. Much more important is the *real* use, by which are produced the pure notions whereby we think things as they are. These pure notions are the laws of the operation of the intellect; they are *leges intellectus*.

Apart, then, from the expanded treatment of space and time as subjective forms, we find in the *Dissertation* little more than the very precise and definite formulation of the slowly growing opposition to the Leibnitzian doctrines. That the pure intellectual notions should be defended as springing from the nature of intellect is not out of harmony with the statement of the *Träume eines Geistersehers*, for there the pure notions were allowed to exist, but were not held to have validity for actual things except on grounds of experience. Here they are supposed to exist, dissevered from experience, and are allowed validity as determinations of things in themselves.

The stage which Kant had now reached in his philosophical development was one of great significance. The doctrine of knowledge expressed in the *Dissertation* was the final form which the Wolffian rationalism could assume for him, and, though many of the elements of the *Kritik* are contained therein, it was not really in advance of the Wolffian theory. The doctrine of space and time as forms of sense-perception, the reference of both space and time and the pure intellectual notions to the laws of the activity of mind itself, the distinction between sense and understanding as one of kind, not of degree, with the correlative distinction between phenomena and noumena,—all of these reappear, though changed and modified, in the *Kritik*. But, despite this resemblance, it seems clear that, so far as the *Dissertation* is concerned, the way had only been prepared for the true critical inquiry, and that the real import of Hume's skeptical problem had not yet dawned upon Kant. From the manner, however, in which the doctrine of knowledge had been stated in the *Dissertation*, the further inquiry had been rendered inevitable. It had become quite impossible for Kant to remain longer satisfied with the ambiguous position assigned to a fundamental element of his doctrine of knowledge, the so-called pure intellectual notions. These notions, according to the *Dissertation*, had no function save in relation to things-in-themselves, *i. e.*, to objects which are not directly or immediately brought into relation to our faculty of cognition. They did not serve as the connecting links of formed experience; on the contrary, they were supposed to be absolutely dissevered from all experience which was possible for intelligence like ours. In his previous essays, Kant, while likewise maintaining that such pure, irreducible notions existed, had asserted in general terms that they applied to experience, and that their applicability or justification rested on experience itself, but had not raised the question as to the ground of such justification. Now, from another side, the supreme difficulty was presented—how could such notions have application to any objects whatsoever? For some time the correlative difficulty, how *objects* of sense-perception were possible, does not seem to have suggested itself to Kant. In the *Dissertation* sense-perception had been taken as receptivity of representations of objects, and experience as the product of the treatment of such representations by the logical or analytical processes of understanding. Some traces of this confused fashion of regarding sense-perceptions are left even in the *Kritik*, specially perhaps in the *Aesthetik*, and they give rise to much of the ambiguity which unfortunately attaches to the more developed theory of cognition. So soon, however, as the critical question was put, on what rests the reference of representations in us to the object or thing? in other words, how do we come to have knowledge of objects at all? it became apparent that the problem was one of perfect generality, and applied, not only to cognition through the pure notions, but to sense-perceptions likewise. It is in the statement of this general problem that we find the new and characteristic feature of Kant's work.

There is thus no reason to doubt the substantial accuracy of Kant's reference to the particular occasion or cause of the critical inquiry. Up to the stage indicated by the *Dissertation*, he had been attempting, in various ways, to unite

two radically divergent modes of explaining cognition—that which would account for the content of experience by reference to affection from things without us, and that which viewed the intellect itself as somehow furnished with the means of pure, rational cognition. He now discovered that Hume's skeptical analysis of the notion of cause was really the treatment of one typical or crucial instance of the much more general problem. If experience, says Hume, consists solely of states of mind somehow given to us, each of which exists as an effect, and therefore as distinct from others, with what right do we make the common assumption that parts of experience are necessarily connected? The only possible answer, drawn from the premises laid down, must be that there is no warrant for such an assumption. Necessity for thought, as Kant had been willing to admit and as Hume also held, involves or implies something more than is given in experience—for that which is given is contingent—and rests upon an *a priori* or pure notion. But *a priori* notions, did they exist, could have no claim to regulate experience. Hume, therefore, for his part, rejected entirely the notion of cause as being fictitious and delusive, and professed to account for the habit of regarding experience as necessarily connected by reference to arbitrarily formed custom of thinking. Experience, as given, contingent material, had a certain uniformity, and recurring uniformities generated in us the habit of regarding things as necessarily connected. That such a resort to experience for explanation could lead to no valid conclusion has been already noted as evident to Hume himself.

The dogmatic or individualist conception of experience had thus proved itself inadequate to the solution of Hume's difficulty regarding the notion of cause,—a difficulty which Kant, erroneously, had thought to be the only case contemplated by his predecessor. The perception of its inadequacy in this respect, and the consequent generalization of Hume's problem, are the essential features of the new critical method. For Kant was now prepared to formulate his general inquiry in a definite fashion. His long-continued reflection on the Wolffian doctrine of knowledge had made clear to him that synthetic connection, the essence of real cognition, was not contained in the products of thinking as a formal activity of mind operating on material otherwise supplied. On the other hand, Hume's analysis enabled him to see that synthetic connection was not contained in experience regarded as given material. Thus neither the formal nor the material aspect of conscious experience, when regarded from the individualist point of view, supplied any foundation for real knowledge, whether *a priori* or empirical. An absolutely new conception of experience was necessary, if the fact of cognition was to be explained at all, and the various modes in which Kant expresses the business of his critical philosophy were merely different fashions of stating the one ultimate problem, differing according to the particular aspect of knowledge which he happened to have in view. To inquire how synthetic *a priori* judgments are possible, or how far cognition extends, or what worth attaches to metaphysical propositions, is simply to ask, in a specific form, what elements are necessarily involved in experience of which the subject is conscious. How is it possible for the individual thinking subject to connect together the parts of his experience in the mode we call cognition?

The problem of the critical philosophy is, therefore, the complete analysis of experience from the point of view of the conditions under which such experience is possible for the conscious subject. The central ideas are thus self-consciousness, as the supreme condition under which experience is subjectively possible, and the manifold details of experience as a varied and complex whole. The solution of the problem demanded the utmost care in keeping the due balance between these ideas; and it can hardly be said that Kant was perfectly successful. He is frequently untrue to the more comprehensive conception which dominates his work as a whole. The influence of his previous philosophical training, nay, even the unconscious influence of terminology, frequently induces in his statements a certain laxity and want of clearness. He selects definitely for his starting-point neither the idea of self-consciousness nor the details of experience, but in his actual procedure passes from one to the other, rarely, if ever, taking into full consideration the weighty question of their relation to one another. Above all, he is continuously under the influence of the individualist notion which he had done so much to explode. The conception of conscious experience, which is the net result of the *Kritik*, is indefinitely profounder and richer than that which had ruled the 18th century philosophizing, but for Kant such experience still appears as somehow the arbitrary product of the relation between the individual conscious subject and the realm of real facts. When he is actually analyzing the conditions of knowledge, the influence of the individualist conception is not prominent; the conditions are stated as quite general, as conditions of knowledge. But so soon as the deeper, metaphysical problems present themselves, the shadow of the old doctrine reappears. Knowledge is regarded as a mechanical product, part furnished by the subject, part given to the subject, and is thus viewed as mechanically divisible into *a priori* and *a posteriori*, into pure and empirical, necessary and contingent. The individual as an agent, conscious of universal moral law, is yet regarded as in a measure opposed to experience, and the Kantian ethical code remains purely formal. The ultimate relation between intelligence and natural fact, expressed in the notion of end, is thought as problematic or contingent. The difficulties or obscurities of the Kantian system, of which the above are merely the more prominent, may all be traced to the one source, the false or at least inadequate idea of the individual. The more thorough explanation of the relation between experience as critically conceived and the individual subject was the problem left by Kant for his successors.

In any detailed exposition of the critical system it would be requisite in the first place to state with some fulness the precise nature of the problems immediately before Kant, and in the second place to follow with some closeness the successive stages of the system as presented in the three main works, the *Kritik of Pure Reason*, the *Kritik of Practical Reason*, and the *Kritik of Judgment*, with the more important of the minor works, the *Metaphysic of Nature* and the *Metaphysic of Ethics*. It would be necessary, also, in any such expanded treatment, to bring out clearly the Kantian classification of the philosophical sciences, and to indicate the relation between the critical or transcendental investigation of the several faculties and the more developed sciences to which that investigation serves as introduction. As any detailed statement of the critical system, however compressed, would be beyond the limits of the present article, it is proposed here to select only the more salient doctrines, and to point out in connection with them what advance had been effected by Kant, and what remained for subsequent efforts at complete solution of the problems raised by him. Much that is of interest and value must necessarily be omitted in any sketch of so elaborate a system, and for all points of special interpretation reference must needs be made to the many elaborate dissertations on or about the Kantian philosophy.

The doctrine from which Kant starts in his critical or transcendental investigation of knowledge is that to which the slow development of his thought had led him. The essence of cognition or knowledge was a synthetic act, an act of combining in thought the detached elements of experience. Now synthesis was explicable neither by reference to pure thought, the logical or elaborative faculty, which in Kant's view remained analytic in function, nor by reference to the effects of external real things upon our faculties of cognition. For, on the one hand, analysis or logical treatment applied only to objects of knowledge as already given in synthetic forms, and, on the other hand, real things could yield only isolated effects and not the combination of these effects in the forms of cognitive experience. If experience is to be matter of knowledge for the conscious subject, it must be regarded as the conjoint product of given material and synthetic combination. Form and matter may indeed be regarded separably and dealt with in isolation for purposes of critical inquiry, but in experience they are necessarily and inseparably united. The problem of the *Kritik* thus becomes for Kant the complete statement of the elements necessarily involved in synthesis, and of the subjective processes by which these elements are realized in our individual consciousness. He is not asking, with Locke, whence the details of experience arise; he is not attempting a natural history of the growth of experience in the individual mind; but he is endeavoring to state exhaustively what conditions are necessarily involved in any fact of knowledge, *i.e.*, in any synthetic combination of parts of experience by the conscious subject.

So far as the elements necessarily involved in conscious experience are concerned, these may be enumerated briefly thus:—given data of sense, inner or outer; the forms of perception, *i.e.*, space and time; the forms of thought, *i.e.*, the categories; the ultimate condition of knowledge, the identity of the pure ego or self. The ego or self is the central unity in reference to which alone is any part of experience cognizable. But the consciousness of self is the foundation of knowledge only when related to given material. The ego has not in itself the element of difference, and the essence of knowledge is the consciousness of unity in difference. For knowledge, therefore, it is necessary that difference should be *given* to the ego. The modes under which it is possible for such given difference to become portion of the conscious experience of the ego, the

modes under which the isolated data can be synthetically combined so as to form a cognizable whole, make up the form of cognition, and upon this form rests the possibility of any *a priori* or rational knowledge.

The notion of the ego as a purely logical unity, containing in itself no element of difference, and having only analytic identity, is fundamental in the critical system, and lies at the root of all its difficulties and perplexities. To say that the ego as an individual does not *produce* the world of experience is by no means the same as to say that the ego is pure unity without element of difference. In the one case we are treating the ego as one of the objects of experience and denying of it productive efficacy; in the second case we are dealing with the unity of the ego as a condition of knowledge, of any experience whatsoever. In this second sense, it is wholly wrong to assert that the ego is pure identity, pure unity. The unity and identity of the ego, so regarded, are taken in abstraction, *i.e.*, as dissevered from the more complex whole of which they are necessary elements. When the ego is taken as a condition of knowledge, its unity is not more important than the difference necessarily correlated with it. That the ego as a thing should not produce difference is quite beside the mark. The consequences of the abstract separation which Kant so draws between the ego and the world of experience are apparent throughout his whole system. Assuming at the outset an opposition between the two, self and matter of knowledge, he is driven by the exigencies of the problem of reconciliation to insert term after term as means of bringing them together, but never succeeds in attaining a junction which is more than mechanical. To the end, the ego remains, partly the pure logical ego, partly the concrete individual spirit, and no explanation is afforded of the relation between them. It is for this reason that the system of forms of perception and categories appears so contingent and haphazard. No attempt is made to show how or why the difference supplied for the pure logical ego should present itself necessarily under these forms. They are regarded rather as portions of the subjective mechanism of the individual consciousness. The mind or self appears as though it were endowed with a complex machinery by which alone it could act upon the material supplied to it. Such a crude conception is far, indeed, from doing justice to Kant's view, but it undoubtedly represents the underlying assumption of many of his cardinal doctrines. The philosophy of Fichte is historically interesting as that in which the deficiencies of Kant's fundamental position were first discerned and the attempt made to remedy them.

Unfortunately for the consistency of the *Kritik*, Kant does not attempt to work out systematically the elements involved in knowledge before considering the subjective processes by which knowledge is realized in consciousness. He mixes up the two inquiries, and in the general division of his work depends rather upon the results of previous psychology than upon the lines prescribed by his own new conception of experience. He treats the elements of cognition separately in connection with the several subjective processes involved in knowledge, viz., sense and understanding. Great ambiguity is the natural result of this procedure. For it was not possible for Kant to avoid the misleading connotation of the terms employed by him. In strictness sense, understanding, imagination, and reason ought to have had their functions defined in close relation to the elements of knowledge with which they are severally connected, and as these elements have no existence as separate facts, but only as factors in the complex organic whole, it might have been possible to avoid the error of supposing that each subjective process furnished a distinct, separately cognizable portion of a mechanical whole. But the use of separate terms, such as sense and understanding, almost unavoidably led to phraseology only interpretable as signifying that each furnished a specific kind of knowledge, and all Kant's previous training contributed to strengthen this erroneous view. Especially noteworthy is this in the case of the categories. Kant insists upon treating these as *Begriffe*, notions, and assigns to them certain characteristics of notions. But it is readily seen, and in the *Logik* Kant shows himself fully aware of the fact, that these pure connective links of experience, general aspects of objects of intelligible experience, do not resemble concepts formed by the so-called logical or elaborative processes from representations of completed objects. Nothing but harm can follow from any attempt to identify two products which differ so entirely. So, again, the *Aesthetik* is rendered extremely obscure and difficult by the prevalence of the view, already noted as obtaining in the *Dissertation*, that sense is a faculty receiving representations of objects. Kant was anxious to avoid the error of Leibnitz, who had taken sense and understanding to differ in degree only, not in kind; but in avoiding the one error he fell into another of no less importance.

The consideration of the several elements which in combination make up the fact of cognition, or perception, as it may be called, contains little or nothing bearing on the origin and nature of the given data of sense, inner or outer. The manifold of sense, which plays so important a part in the critical theory of knowledge, is left in an obscure and perplexed position. So much is clear, however, that according to Kant sense is not to be regarded as receptive of representations of objects. The data of sense are mere *stimuli*, not partial or confused representations. The sense-manifold is not to be conceived as having, *per se*, any of the qualities of objects as actually cognized; its parts are not cognizable *per se*, nor can it with propriety be said to be received successively or simultaneously. When we apply predicates to the sense-manifold regarded in isolation, we make that which is only a factor in the experience of objects into a separate, independent object, and use our predicates transcendently. Kant is not always in his language faithful to his view of the sense-manifold, but the theory as a whole, together with his own express definitions, is unmistakable. On the origin of the data of sense, Kant's remarks are few and little satisfactory. He very commonly employs the term *affection* of the faculty of sense as expressing the mode of origin, but offers no further explanation of a term which has significance only when interpreted after a somewhat mechanical fashion. Unquestionably certain of his remarks indicate the view that the origin is to be sought in things-in-themselves, but against hasty misinterpretations of such remarks there are certain cautions to be borne in mind. The relation between phenomena and noumena in the Kantian system does not in the least resemble that which plays so important a part in modern psychology—between the subjective results of sense affection and the character of the objective conditions of such affection. Kant has pointedly declared that it would be a gross absurdity to suppose that in his view separate, distinct things-in-themselves existed corresponding to the several objects of perception. And, finally, it is not at all difficult to understand why Kant should say that the affection of sense originated in the action of things-in-themselves, when you consider what was the thing-in-itself to which he was referring. The thing-in-itself to which the empirical order and relations of sense-experience are referred is the divine order, which is not matter of knowledge, but involved in our practical or moral beliefs. Critics who limit their view to the *Kritik of Pure Reason*, and there, in all probability, to the first or constructive portion of the work, must necessarily fail to interpret the doctrines of the Kantian system, which do not become clear or definite till the system has been developed. Reason was, for Kant, an organic whole; the speculative and moral aspects are never severed; and the solution of problems which appear at first sight to belong solely to the region of speculative thought may be found ultimately to depend upon certain characteristics of our nature as practical.

Data of sense-affection do not contain in themselves synthetic combination. The first conditions of such combination are found by Kant in the universal forms under which alone sense-phenomena manifest themselves in experience. These universal forms of perception, space and time, are necessary, *a priori*, and in charateristic features resembling intuitious, not notions. They occupy, therefore, a peculiar position, and one section of the *Kritik*, the *Aesthetik*, is entirely devoted to the consideration of them. It is important to observe that it is only through the *a priori* character of these perceptive forms that rational science of nature is at all possible. Kant is here able to resume, with fresh insight, his previous discussions regarding the synthetic character of mathematical propositions. In his early essays he had rightly drawn the distinction between mathematical demonstration and philosophic proof, referring the certainty of the first to the fact that the constructions were synthetic in character and entirely determined by the action of constructive imagination. It had not then occurred to him to ask, With what right do we assume that the conclusions arrived at from arbitrary constructions in mathematical matter have applicability to objects of experience? Might not mathematics be a purely imaginary science? To this question he is now enabled to return an answer. Space and time, the two essential conditions of sense-perception, are not data given by things, but universal forms of intellect into which all data of sense must be received. Hence, whatever is true of space and time regarded by imagination as objects, *i.e.*, quantitative constructions, must be true of the objects making up our sense-experience. The same forms and the same constructive activity of imagination are in-

volved in mathematical synthesis and in the constitution of objects of sense-experience. The foundation for pure or rational mathematics, there being included under this the pure science of movement, is thus laid in the critical doctrine of space and time.

The *Aesthetik* isolates sense perception, and considers its forms as though it were an independent, complete faculty. A certain confusion, arising from this, is noticeable in the *Analytik* when the necessity for justifying the position of the categories is under discussion, but the real difficulty in which Kant was involved by his doctrine of space and time has its roots even deeper than the erroneous isolation of sensibility. He has not in any way "deduced" space and time, but, proceeding from the ordinary current view of sense-experience, has found these remaining as residuum after analysis. The relation in which they stand to the categories or pure notions is ambiguous; and, when Kant has to consider the fashion in which category and data of sense are to be brought together, he merely places side by side as *a priori* elements the pure connective notions and the pure forms of perception, and finds it, apparently, only a matter of contingent convenience that they should harmonize with one another and so render cognition possible. To this point also Fichte was the first to call attention.

Affection of sense, even when received into the pure forms of perception, is not matter of knowledge. For cognition there is requisite synthetic combination, and the intellectual function through which such combination takes place. The forms of intellectual function Kant proceeds to enumerate with the aid of the commonly received logical doctrines. For this reference to logic he has been severely blamed, but the precise nature of the debt due to the commonly accepted logical classification is very generally misconceived. Synthetic combination, Kant points out, is formally expressed in a judgment, which is the act of uniting representations. At the foundation of the judgments which express the types of synthetic combination, through which knowledge is possible, lie the pure general notions, the abstract aspect of the conditions under which objects are cognizable in experience. General logic has also to deal with the union of representations, though its unity is analytic merely, not synthetic. But the same intellectual function which serves to give unity in the analytic judgments of formal logic serves to give unity to the synthetic combinations of real perception. It appeared evident, then, to Kant that in the forms of judgment, as they are stated in the common logic, there must be found the analogues of the types of judgment which are involved in transcendental logic, or in the theory of real cognition. His view of the ordinary logic was wide and comprehensive, though in his restriction of the science to pure form one can trace the influence of his earlier training, and it is no small part of the value of the critical philosophy that it has revived the study of logic and prepared the way for a more thorough consideration of logical doctrines. The position assigned to logic by Kant is not, in all probability, one which can be defended; indeed, it is hard to see how Kant himself, in consistency with the critical doctrine of knowledge, could have retained many of the older logical theorems, but the precision with which the position was stated, and the sharpness with which logic was marked off from cognate philosophic disciplines, prepared the way for the more thoughtful treatment of the whole question.

Formal logic thus yields to Kant the list of the general notions, pure intellectual predicates, or categories, through which alone experience is possible for a conscious subject. It has already been noted how serious was the error involved in the description of these as notions, without further attempts to clear up their precise significance. Kant, indeed, was mainly influenced by his strong opposition to the Leibnitzian rationalism, and therefore assigns the categories to understanding, the logical faculty, without consideration of the question,—which might have been suggested by the previous statements of the *Dissertation*,—what relation these categories held to the empirical notions formed by the comparison, abstraction, and generalization when directed upon representations of objects? But when the categories are described as notions, *i. e.*, formed products of thought, there rises of necessity the problem which had presented itself to Kant at every stage of his pre-critical thinking,—with what right can we assume that these notions apply to objects of experience? The answer which he proceeds to give altogether explodes the definition of the categories as formed products of thought, and enables us to see more clearly the nature of the new conception of experience which lies in the background of all the critical work.

The unity of the ego, which has been already noted as an element entering into the synthesis of cognition, is a unity of a quite distinct and peculiar kind. That the ego to which different parts of experience are presented must be the same ego, if there is to be cognition at all, is analytically evident; but the peculiarity is that the ego must be conscious of its own unity and identity, and this unity of self-consciousness is only possible in relation to difference not contained in the ego but given to it. The unity of apperception, then, as Kant calls it, is only possible in relation to synthetic unity of experience itself, and the forms of this synthetic unity, the categories, are therefore, on the one hand, necessary as forms in which self-consciousness is realized, and, on the other hand, restricted in their application and validity to the data of given sense, or the particular element of experience. Thus experience presents itself as the organic combination of the particular of sense with the individual unity of the ego through the universal forms of the categories. Reference of representations to the unity of the object, synthetic unity of apperception, and subsumption of data of sense under the categories, are thus three sides or aspects of the one fundamental fact.

In this deduction of the categories, as Kant calls it, there appears for the first time an endeavor to connect together into one organic whole the several elements entering into experience. It is evident, however, that much was wanting before this essential task could be regarded as complete. Kant has certainly brought together self-consciousness, the system of the categories and data of sense. He has shown that the conditions of self-consciousness are the conditions of possible experience. But he has not shown, nor did he attempt to show, how it was that the conditions of self-consciousness are the very categories arrived at by consideration of the system of logical judgments. He does endeavor to show, but with small success, how the junction of category and data of sense is brought about, for according to his scheme these stood, to a certain extent at least, apart from and independent of one another. The failure to effect an organic combination of the several elements was the natural consequence of the false start which had been made.

The mode in which Kant endeavors to show how the several portions of cognition are subjectively realized brings into the clearest light the inconsistencies and imperfections of his doctrine. Sense had been assumed as furnishing the particular of knowledge, understanding as furnishing the universal; and it had been expressly declared that the particular was cognizable only in and through the universal. Still, each was conceived as somehow in itself complete and finished. Sense and understanding had distinct functions, and there was wanting some common term, some intermediary which should bring them into conjunction. Data of sense as purely particular could have nothing in common with the categories as purely universal. But data of sense had at least one universal aspect,—their aspect as the particular of the general forms, space and time. Categories were in themselves abstract and valueless, serviceable only when restricted to possible objects of experience. There was thus a common ground on which category and intuition were united in one, and an intermediate process whereby the universal of the category might be so far individualized as to comprehend the particular of sense. This intermediate process—which is really the junction of understanding and sense—Kant calls productive imagination, and it is only through productive imagination that knowledge or experience is actually realized in our subjective consciousness. The specific forms of productive imagination are called *schemata*, and upon the nature of the schema Kant gives much that has proved of extreme value for subsequent thought.

Productive imagination is thus the concrete element of knowledge, and its general modes are the abstract expression of the *a priori* laws of all possible experience. The categories are restricted in their applicability to the schema, *i. e.*, to the pure forms of conjunction of the manifold in time, and in the modes of combination of schemata and categories we have the foundation for the rational sciences of mathematics and physics. Perception or real cognition is thus conceived as a complex fact, involving data of sense and pure perceptive forms, determined by the category and realized through productive imagination in the schema. The system of principles which may be deduced from the consideration of the mode in which understanding and sense are united by productive imagination is the positive result of the critical theory of knowledge, and some of its features are remarkable enough to deserve attention. According to his usual plan, Kant arranges these principles in conformity with the table of the categories, dividing the four classes, however, into two main groups, the mathematical and the dynamical. The mathematical principles are the abstract expression of the necessary mode in which

data of sense are determined by the category in the form of intuitions or representations of objects; the dynamical are the abstract expression of the modes in which the existence of objects of intuition is determined. The mathematical principles are constitutive, *i. e.*, express determinations of the objects themselves; the dynamical are regulative, *i. e.*, express the conditions under which objects can form parts of real experience. Under the mathematical principles come the general rules which furnish the ground for the application of quantitative reasoning to real facts of experience. For as data of sense are only possible objects when received in the forms of space and time, and as space and time are only cognized when determined in definite fashion by the understanding through the schema of number (quantity) or degree (quality), all intuitions are extensive quantities and contain a real element, that of sense, which has degree. Under the dynamical principles, the general modes in which the existence of objects are determined, fall the analogies of experience, or general rules according to which the existence of objects in relation to one another can be determined, and the postulates of experience, the general rules according to which the existence of objects for us or our own subjective existence can be determined. The analogies of experience rest upon the order of perceptions in time, *i. e.*, their permanence, succession, or coexistence, and the principles are respectively those of substance, causality, and reciprocity. It is to be observed that Kant in the expression of these analogies reaches the final solution of the difficulty which had so long pressed upon him, the difficulty as to the relation of the pure connective notions to experience. These notions are not directly applicable to experience, nor do we find in experience anything corresponding to the pure intellectual notions of substance, cause, and reciprocity. But experience is for us the combination of data of sense in the forms of productive imagination, forms determined by the pure intellectual notions, and accordingly experience is possible for us only as in modes corresponding to the notions. The permanent in time is substance in any possible experience, and no experience is possible save through the determination of all changes as in relation to a permanent in time. Determined sequence is the causal relation in any possible experience, and no experience is possible save through the determination of perceived changes as in relation to a determined order in time. So with coexistence and reciprocity.

The postulates of experience are general expressions of the significance of existence in the experience of a conscious subject. The element of reality in such experience must always be given by intuition, and, so far as determination of existence is assumed, external intuition is a necessary condition of inner intuition. The existence of external things is as certain as the existence of the concrete subject, and the subject cannot cognize himself as existing save in relation to the world of facts of external perception. Inner and outer reality are strictly correlative elements in the experience of the conscious subject.

Throughout the positive portion of his theory of cognition, Kant has been beset by the doctrine that the categories, as finished, complete notions, have an import or significance transcending the bounds of possible experience. Moreover, the manner in which space and time had been treated made it possible for him to regard these as contingent forms, necessary for intelligence like ours, but not to be viewed as absolutely necessary. The real meaning of these peculiarities is hardly ever expressed by him, though it is clear that the solution of the matter is to be found in the inadequacy of the positive theory to meet the demands of reason for completed explanation. But the conclusion to which he was led was one of the greatest importance for the after development of his system. Cognition is necessarily limited. The categories are restricted in their application to elements of possible experience to that which is presented in intuition, and all intuition is for the ego contingent. But to assert that cognition is limited and its matter contingent is to form the idea of an intelligence for whom cognition would not be limited and for whom the data of intuition would not be given, contingent facts, but necessarily produced along with the pure categories. This idea of an intuitive understanding is the definite expression for the completed explanation which reason demands, and it involves the conception of a realm of objects for such an understanding, a realm of objects which, in opposition to the *phenomena* of our relative and limited experience, may be called *noumena* or things-in-themselves. The *noumenon*, therefore, is in one way the object of a non-sensuous intuition, but more correctly is the expression of the limited and partial character of our knowledge. The idea of a noumenon is thus a limiting notion.

Assuredly, the difficult section of the *Kritik*, on the ground of the distinction between phenomena and noumena, would not have led to so much misconception as it has done, had Kant then brought forward what lies at the root of the distinction, his doctrine of reason and its functions. Understanding, as has been seen, is the faculty of cognition strictly so called; and within its realm, that of space, time, and matter, positive knowledge is attainable. But the ultimate conception of understanding, that of the world of objects, quantitatively determined, and standing in relation of mutual reciprocity to one another, is not a final ground of explanation. We are still able and necessitated to reflect upon the whole world of phenomena thus cognized, and driven to inquire after its significance. In our reflection we necessarily treat the objects, not as phenomena, as matters of positive, scientific knowledge, but as things-in-themselves, as noumena. The distinction between phenomena and noumena is, therefore, nothing but the expression of the distinction between understanding and reason, a distinction which, according to Kant, is merely subjective.

The specific function of reason is the effort after completed explanation of the experience presented in cognition. But in such effort there are no notions to be employed other than the categories, and these, as has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect, throws fresh light on the limits to human knowledge and the significance of experience.

Experience has presented itself as the complex result of relation between the ego or subject and the world of phenomena. Reason may, therefore, attempt a completed explanation either of the ego or of the world of phenomena or of the total relation between them. The three inquiries correspond to the subjects of the three ancient metaphysical sciences, rational psychology, rational cosmology, rational theology. It is readily seen, in regard to the first of them, that all attempts to determine the nature of the ego as a simple, perdurable, immaterial substance rest upon a confusion between the ego as pure logical unity and the ego as object of intuition, and involve a transcendent use of the categories of experience. It profits only to apply such categories to the soul, for no intuition corresponding to them is or can be given. The idea of the soul must be regarded as transcendent. So too when we endeavor, with the help of the categories of quantity, quality, relation, and modality, to determine the nature and relation of parts of the world, we find that reason is landed in a peculiar difficulty. Any solution that can be given is too narrow for the demands of reason and too wide for the restrictions of understanding. The transcendent employment of the categories lead to antinomy, or equally balanced statements of apparently contradictory results. Due attention to the relation between understanding and reason enables us to solve the antinomies and to discover their precise origin and significance. Finally, the endeavor to find in the conception of God, as the supreme reality, the explanation of experience, is seen to lead to no valid conclusion. There is not any intuition given whereby we might show the reality of our idea of a Supreme Being. So far as knowledge is concerned, God remains a transcendental ideal.

The criticism of the transcendental ideas, which is also the examination of the claims of metaphysic to rank as a science, yields a definite and intelligible result. These ideas, the expression of the various modes in which unity of reason may be sought, have no objects corresponding to them in the sphere of cognition. They have not, therefore, like the categories, any *constitutive* value, and all attempts at metaphysical construction with the notions or categories of science must be resigned as of necessity hopeless. But the ideas are not, on that account, destitute of all value. They are supremely significant, as indicating the very essence of the function of reason. The limits of scientific cognition become intelligible, only when the sphere of understanding is subjected to critical reflection and compared with the possible sphere of reason, that is, the sphere of rationally complete cognition. The ideas, therefore, in relation to knowledge strictly so called, have *regulative* value, for they furnish the general precepts for extension and completion of knowledge, and, at the same time, since they spring from reason itself, they have a real value in relation to reason as the very inmost nature of intelligence. Self-consciousness cannot be regarded as merely a mechanically determined result. Free reflection upon the whole system of knowledge is sufficient to indicate that the sphere of intuition, with its rational principles, does not exhaust conscious experience. There still remains, over and above the realm of nature, the realm of free, self-conscious spirit; and, within this sphere, it may be anticipated that the

ideas will acquire a significance richer and deeper than the merely regulative import which they possess in reference to cognition.

Where, then, are we to look for this realm of free self-consciousness? Not in the sphere of cognition, where objects are mechanically determined, but in that of will or of reason as practical. That reason is practical or prescribes ends for itself is sufficiently manifest from the mere fact of the existence of the conception of morality or duty, a conception which can have no corresponding object within the sphere of intuition, and which is theoretically, or in accordance with the categories of understanding, incognizable. The presence of this conception is the datum upon which may be founded a special investigation of the conditions of reason as practical, a *Kritik* of pure practical reason, and the analysis of it yields the statement of the formal prescripts of morality.

The realization of duty is impossible for any being which is not thought as free, *i. e.*, capable of self-determination. Freedom, it is true, is theoretically not an object of cognition, but its impossibility is not thereby demonstrated. The theoretical proof rather serves as useful aid towards the more exact determinatiou of the nature and province of self-determination, and of its relation to the whole concrete nature of humanity. For in man self-determination and mechanical determination by empirical motives coexist, and only in so far as he belongs and is conscious of belonging both to the sphere of sense and to the sphere of reason does moral obligatiou become possible for him. The supreme end prescribed by reason in its practical aspect, namely, the complete subordination of the empirical side of nature to the prescripts of morality, demands, as conditions of its possible realization, the permanence of ethical progress in the moral agent, the certainty of freedom in self-determination, and the necessary harmonizing of the spheres of sense and reason through the intelligent author or ground of both. These conditions, the postulates of practical reason, are the concrete expressions of the three transcendental ideas, and in them we have the full significance of the ideas for reason. Immortality of the soul, positive freedom of will, and the existence of an intelligent ground of things are speculative ideas practically warranted, though theoretically neither demonstrable nor comprehensible.

Thus reason as self-determining supplies notions of freedom; reason as determined supplies categories of understanding. Union between the two spheres, which seem at first sight disparate, is found in the necessary postulate that reason shall be realized, for its realization is only possible in the sphere of sense. But such a union, when regarded *in abstracto*, rests upon, or involves, a notion of quite a new order, that of the adaptation of nature to reason, or, as it may be expressed, that of end in nature. Understanding and reason thus coalesce in the faculty of *judgment*, which mediates between, or brings together, the universal and particular elements in conscious experience. Judgment is here merely *reflective;* that is to say, the particular element is given, so determined as to be possible material of knowledge, while the universal, not necessary for cognition, is supplied by reason itself. The empirical details of nature, which are not determined by the categories of understanding, are judged as being arranged or ordered by intelligence, for in no other fashion could nature, in its particular, contingent aspect, be thought as forming a complete, consistent, intelligible whole.

The investigation of the conditions under which adaptation of nature to intelligence is conceivable and possible makes up the subject of the third great *Kritik*, the *Kritik of Judgment*, a work presenting unusual difficulties to the interpreter of the Kantian system. The general principle of the adaptation of nature to our faculties of cognition has two specific applications, with the second of which it is more closely connected than with the first. In the first place, the adaptation may be merely *subjective*, when the empirical condition for the exercise of judgment is furnished by the feeling of pleasure or pain; such adaptation is æsthetic. In the second place, the adaptation may be objective or logical, when empirical facts are given of such a kind that their possibility can be conceived only through the notion of the end realized in them; such adaptation is teleological, and the empirical facts in question are organisms.

Æsthetics, or the scientific consideration of the judgments resting on the feelings of pleasure and pain arising from the harmony or want of harmony between the particular of experience and the laws of understanding, is the special subject of the *Kritik of Judgment*, but the doctrine of teleology there unfolded is the more important for the complete view of the critical system. For the analysis of the teleological judgment and of the consequences flowing from it leads to the final statement of the nature of experience as conceived by Kant. The phenomena of organic production furnish data for a special kind of judgment, which, however, involves or rests upon a quite general principle, that of the contingency of the particular element in nature and its subjectively necessary adaption to our faculty of cognition. The notion of contingency arises, according to Kant, from the fact that understanding and sense are distinct, that understanding does not determine the particular of sense, and, consequently, that the principle of the adaptation of the particular to our understanding is merely supplied by reason on account of the peculiarity or limited character of understanding. End in nature, therefore, is a subjective or problematic conception, implying the limits of understanding, and consequently resting upon the idea of an understanding constituted unlike ours,—of an intuitive understanding in which particular and universal should be given together. The idea of such an understanding is, for cognition, transcendent, for no corresponding fact of intuition is furnished, but it is realized with practical certainty in relation to reason as practical. For we are, from practical grounds, compelled with at least practical necessity to ascribe a certain aim or end to this supreme understanding. The moral law, or reason as practical, prescribes the realization of the highest good, and such realization implies a higher order than that of nature. We must, therefore, regard the supreme cause as a moral cause, and nature as so ordered that realization of the moral end is in it possible. The final conception of the Kantian philosophy is, therefore, that of ethical teleology. As Kant expresses it in a remarkable passage of the *Kritik*, "The systematic unity of ends in this world of intelligences, which, although as mere nature it is to be called only the world of sense, can yet as a system of freedom be called an intelligible, *i. e.*, moral world (*regnum gratiæ*), leads inevitably to the teleological unity of all things which constitute this great whole according to universal natural laws, just as the unity of the former is according to universal and necessary moral laws, and unites the practical with the speculative reason. The world must be represented as having originated from an idea, if it is to harmonize with that use of reason without which we should hold ourselves unworthy of reason—viz., the moral use, which rests entirely on the idea of the supreme good. Hence all natural research tends towards the form of a system of ends, and in its highest development would be a physico-theology. But this, since it arises from the moral order as a unity grounded in the very essence of freedom and not accidentally instituted by external commands, establishes the teleology of nature on grounds which *a priori* must be inseparably connected with the inner possibility of things. The teleology of nature is thus made to rest on a transcendental theology, which takes the ideal of supreme ontological perfection as a principle of systematic unity, a principle which connects all things according to universal and necessary natural laws, since they all have their origin in the absolute necessity of a single primal being" (p. 538).

Editions of Kant's Works.—The standard collective editions are (1) that by Roseukranz and Schubert. 12 vols., 1838–42, containing in vol. ii. the *Life* by Schubert, and in vol. xii. a *History of the Kantian Philosophy* by Rosenkranz; (2) that by Hartenstein, in 10 vols., 1838–39; (3) a second edition by Hartensteiu, in 8 vols., 1867–69, in which the arrangement is strictly chronological; (4) that by Kirchmann, in 8 vols., 1868. Convenient editions of the three *Kritiks* have been published by Kehrbach, and critical editions of the *Prolegomena* and *Kritik d. r. Vernunft* by B. Erdmann, whose treatise *Kants Kriticismus in d. ersten und zweiten Auflage d. Kr. d. r. Vernunft*, 1878, and pamphlet, *Nachträge zu K. Kr. d. r. Vernunft*, 1881, contain much interesting matter.

Of works upon the Kantian philosophy the number is very great. A brief notice of them is given in the bibliographical references iu Ueberweg's *Gesch. d. Philosophie*, Bd. iii. §§ 18–20. A very comprehensive survey is contained in the recent work by H. Vaihinger, *Commentar zu Kants Kritik der reinen Vernunft*, 1881, where the older and more recent literature is elaborately classified and briefly characterized. (R. AD.)

long enough in operation to exhibit permanent effects.

A protective adjustment of duties is far from being a simple scheme, even when it is very desirable. The question arises at once as to how far protection should be granted. If a country be new, without industrial plants, and without skilled labor, it is well-nigh impossible for it to compete with old countries having large investments in factories, wide business correspondence, high credit and low rates of interest, abundant means of communication, and control of extensive and remunerative markets. These are the advantages that accrue from priority in the field. Here is a condition of things that brought from John Stuart Mill his concessions in favor of protection. His language is: "It cannot be expected that individuals should at their own risk, or rather to their certain loss, introduce a new manufacture and bear the burthen of carrying it on, until the producers have been educated up to the level of those with whom the processes have become traditional. A protecting duty, continued for a reasonable time, will sometimes be the least inconvenient mode in which a country can tax itself for the support of such an experiment."

Before there can be any production worthy of taking into consideration, there must be a producing plant. Even for the farmer, his land, his tools, his barns, his fertilizers and his season's labors involve an investment necessarily prior to a harvest. They are to him what a mill is to the flour-manufacturer, or the factory to the weaver. As industrial life grows more complex, manufactures require a large aggregation of capital. The money invested in such enterprises is wasted for all purposes except those of specific production. A new invention, or the improvement of an old one, has often put a farmer, as well as a manufacturer, out of the competitive race, and turned a once valuable property to waste. So a change in methods of transportation, in rates of freight, or even in fashion, will make a particular industry unremunerative. The life of even the best and most modern machinery, too, is short. The waste of capital in establishing and maintaining an industrial plant is something enormous. Time is also necessary, after it is shown that a commodity can be produced cheaply enough to warrant investment, to find a market. Confronting these hard conditions, the pioneer manufacturer of a country may well be apprehensive if he finds that large concerns abroad, with unlimited credit, are bent on his ruin, even at their own temporary loss. Thus John Brougham, at the close of the war of 1812–15, when new industries were nascent in the United States, advised his constituents to glut the American market with goods sold at a loss, in order "to stifle in their cradle these rising manufactures." Under the tariff of 1846 this happened again, and American iron-furnaces went out of blast and rolling-mills were closed because imported English iron was sold at $40 a ton, when the American protected production had been at $60. The industry in the United States was crushed and the old plants were never operated again. Then imported iron rose to $80 a ton.

Another scheme for finding a basis for protective duties is to determine the rate necessary to maintain the superiority of wages in one country over that of another. But this is a complicated method, for, as Professor Richard T. Ely has shown, low wages do not go with cheap production. The better paid workmen have more enterprise, more dexterous adaptations, more invention, and so they demonstrate in the competitive markets of the world that they are worth their wages. Thus Thomas Brassey, when engaged on his French contracts for railway construction, took with him a band of English navvies to whom he paid one dollar a day, while to his French workmen he gave but half that sum, and he thought this well worth his while. In due time his Frenchmen clamored to be put on the same basis of pay as the navvies, and their demand was conceded. The result was economically favorable, for with advanced wages the Frenchmen did correspondingly more and better work. Again, Mr. E. Dubied, a Swiss manufacturer who had visited the Centennial Exposition in Philadelphia (1876), and had investigated the industries of the United States, advised his countrymen: "At this rate there is no reason why all our industries should not be overwhelmed, one after another, by those of America; and yet, when we ask what wages are paid the workmen in the latter country, we learn with surprise that they are three times as much as our workmen, both artisans and farm hands, receive." This result he attributed to the greater variety and excellence of American machinery.

Three causes, however, operate to break down the superiority of highly-paid skilled work. The most important of these is the ever-increasing subdivision of labor, by which the demand for skilled artisans is lessened. Fewer of them are needed in a great modern factory or machine-shop, where the duty of each operative is reduced to a single function. This brings on monotony of toil that is destructive of personal enterprise and ambition in the workman. Another cause is the production of commodities such as Charles Kingsley called "cheap and nasty." In sharp international competition, cheap men produce deteriorated fabrics and adulterated goods, and the market is flooded with them, to the exclusion of better wares from general use. (See ADULTERATION, Vol. I, pp. 152–160.) Thirdly, immigration has had much to do with depressing labor in the United States. In this respect labor, like capital, tends to seek the most remunerative places and functions until its condition is equalized over competing nations. There is but little doubt but that the superior state of the American workman has acted upon the imagination of European wage-earners, drawing them to Western shores and raising the standard of living abroad. But this has been accompanied by a decline in the circumstances of the American wage-earner. It is evident that under free-competition the tendency of labor conditions of the great commercial nations is toward an equality of standards of life. To arrest this process the United States have forbidden the importation of Chinese coolies and the immigration of contract labor and paupers from Europe; and this

is as surely part of a protective system as imposts on foreign commodities produced by cheap labor. There are few things upon which there is greater unanimity of sentiment in the United States than the determination to maintain the superiority of its workmen, both in the difference of their wages from those of Europe and in their degree of comfort. The protectionist asserts that this is most efficiently done by making tariff-rates correspond with the difference of wages.

It has been widely supposed that the agricultural interest receives the least benefit from a protective system, if it does not suffer distinct detriment. To this, answer is made as follows: Under free-trade Great Britain has sacrificed her farming to her manufacturing and trading predilections. In no civilized country is agriculture more depressed or does land go out more from under the plow than in the United Kingdom. Even her pasture area shrinks. Again, the farmer is deeply interested in having an ample market as near his barns as possible. This is to be obtained by diversifying the industries of the country and making them as large as practicable. The more men there are in the shops and factories of the land, the greater will be the demands for the fruits of husbandry. There is a balance to be maintained between the enterprises of a nation. A large sheep-raiser of New Mexico argued that a duty of 7½ per cent on imported wools would soon result in having 100,000,000 sheep in the herds of America. Each sheep requires 5 bushels of corn a year for its maintenance. This industry, therefore, when raised to the condition described, would make a home market for 500,000,000 bushels of corn, or for more than the entire surplus of the country. It is no advantage to the farmer to send his breadstuffs and provisions across the continent and the sea to compete in Liverpool with the wheat of Odessa and India. The transportation charges will be borne by his products. It is far better that the factory town should be near him to consume his surplus. If men are driven from the shops and mills they must go upon the land for a livelihood. This would increase the surplus of agriculture and lower its market price, making farming still less profitable. With this decline would come a lower grade of husbandry and the drift would be toward more hopeless and shiftless deterioration. To no class of the community is the home market more desirable than to the farmer, and it is protection that must create and maintain that market.

It was one of Henry C. Carey's arguments for the home market, that the exportation of farm products was constantly taking fertilizing material from the soil, where it is needed, away to foreign cities where it is not needed, and becomes a nuisance for the pollution of water-courses. This fertilizing material can only be replaced at considerable cost by the transportation of phosphates, nitrates and guano from the isles of the seas or the deserts of Peru. Human ingenuity has not been able to create, but only to discover, potash salts and phosphates. When once taken from the land they must be replaced or the ground will grow sterile. Is it not better for the wealth of a country and the profit of the farmer, that this exploitation of the fertility of land should cease—that his products should be consumed near his fields, so that he can again return to the soil speedily the manures he has taken from it? Is it sound policy to impoverish one land that another may devote itself to manufacture?

Much is said of the injury to the consumer through the artificial rise of prices caused by a protective tariff. But the consumer is also a producer, and it is what he earns in that capacity that enables him to be a consumer at all. It were folly to offer him cheap bread, shelter and clothing, if he is deprived of the means to pay the pittance asked for them. In truth, the most prosperous times of a country are when wages are high and prices good.

Finally, the industrial independence of a country is necessary to its self-defense. A nation can feed its armies from its farm products, but it cannot equip or transport them so. Only countries having diverse and well-established manufactures can maintain a modern navy. It takes a farmer a whole year to turn his capital once, from harvest to harvest; the manufacturer's capital is going and returning incessantly. Hence a manufacturing country will bear a heavier rate of taxation and can meet an emergency more readily than an agricultural one. The nation that is sufficiently developed to supply all its own needs is in a posture to command peace or to repel hostilities as soon as they arise. If it be a protective policy that gives to it industrial independence, then it is a dictate of self-preservation to pursue protection. See FREE-TRADE, Vol. IX, pp. 761–770; and TARIFFS, in these Supplements.

D. O. KELLOGG.

PROTEIDS. See CHEMISTRY, Vol. V, pp. 502, 503.

PROTEROGLYPHA, a suborder of serpents, including those with poison-fangs always erected. The group is opposed to *Solenoglypha* (q.v., in these Supplements). The cobra-de-capello (*Naja*), the sea-snakes (*Hydrophidæ*) and their relatives constitute the group. Some of the most venomous of reptiles are included.

PROTEST. See BILL, Vol. III, p. 582.

PROTESTANT EPISCOPAL CHURCH, IN THE UNITED STATES OF AMERICA, the legal title of that offshoot of the Church of England that was organized in the United States after the achievement of their independence. The expression *Protestant Episcopal* came into vogue in Maryland during the Revolutionary War. At that time the title *Church of England*, which this religious body had borne during colonial times, if it had not become a misnomer, was prejudicial in the minds of a nation striving to throw off the British yoke. The name that came into use indicates that this church is protestant toward the Church of Rome, and episcopal among Protestants. In 1789 a general convention of all the dioceses fixed this title, and it has remained unchanged, notwithstanding repeated proposals by Ritualists and High Churchmen to take a name of vaster comprehension.

COLONIAL PERIOD. The first charter of Virginia (1606) established the Church of England in that province, and in Newport's company came Rev.

Robert Hunt, who first preached in the United States at Jamestown, 21st of June, 1607, under an awning of canvas. He built a tiny church there, and served in it until his early death. In 1619 Governor Yardley organized the first legislative assembly of Virginia, and it declared the Church of England to be the church of Virginia and made provision for annual stipends to be paid for the support of four clergymen. In 1634 jurisdiction over the whole Anglican Church in the colonies was conferred on the bishop of London, and this was the disciplinary organization of the colonial church for 150 years. During all that time no prelate of that title put foot on American soil, nor was provision made for the creation of a colonial episcopate. The bishop of London ruled by commissaries sent to America, of whom James Blair was the most conspicuous. He was commissary from 1689 to 1743, and had jurisdiction over Maryland and Virginia. Under such a system ordained ministers were only to be obtained either by their importation from Great Britain, or by sending devout men to England for orders at the cost of a long voyage out and back and a considerable sum of money. There was no machinery of ecclesiastical discipline in the colonial church, and this state of things led to important consequences of a dogmatic sort many years afterward.

In New England the development was on quite other lines. The Plymouth Pilgrims were separatists, and did not build the institutions of Massachusetts. They were influential only by the large toleration and sweetness of their example. The Puritans of Massachusetts Bay Colony were men of another mold. At the time of the Endicott settlement in Salem, in 1628, the Puritans of England were not contending for liberty of worship, but for the reformation of the Church of England after the pattern of the church in Geneva. They wished to adhere to the establishment, but to eliminate from it prelacy and vain ceremonies. In America they considered themselves members of the mother-church, only their pattern of it was a purified one. Hence the Endicott immigrants, finding among them two brothers who were sticklers for the use of the *Book of Common Prayer*, sent them home in the ship that brought them, because they promoted sedition. So strong was the hostility to prelacy that the first Episcopal church proceeding from voluntary selection in Boston was not founded until 1723, and then this event came about through an influence originating in Connecticut. However, under the arbitrary command of Sir Edmund Andros, the *Prayer-Book* was forced upon the Old South Meeting-House in 1686, and three years later King's Chapel was built with English contributions, and remained an Episcopal congregation until James Freeman, in 1787, succeeded in carrying it over to the Unitarians.

In 1707 an Anglican parish gained footing in Stratford, Connecticut, and in 1722 Timothy Cutler, rector of Yale College, joined it at the cost of his connection with the college. He then went with Samuel Johnson and two others to England to obtain priest's orders. He and Johnson returned the next year—Cutler, to become rector and founder of Christ Church, Boston; and the latter, to become, in 1754, the first president of King's (Columbia) College, in New York.

In 1696 Trinity Church was built in New York, and Mr. Vesey, who went to London for orders, was for fifty years its first rector. The endowment given to it by Queen Anne, and its farm extending from the church along the Hudson River to Christopher Street, in old Greenwich, have made it the richest single religious corporation in the United States. This parish was organized under an act of the previous year for the maintenance of Episcopal priests, and in the same year Christ Church, Philadelphia, was founded, the first parish of this denomination in Pennsylvania.

In the Carolinas the famous constitution drawn up by John Locke provided for the establishment there of the English Church, though the philosopher did not approve of the clause having that purport, for these colonies were full of dissenters. Thirty-five years later, in 1704, the churchmen of South Carolina obtained a bare majority in the provincial assembly and proceeded to disfranchise dissenters and to order the maintenance of Episcopal churches out of the public revenue—an example followed by North Carolina the next year.

The colonial church had its greatest support in the Society for the Propagation of the Gospel in Foreign Parts, organized in 1701, in London, at the solicitation of Commissaries Blair and Bray. Perhaps its best service was that of putting into the hands of the Bishop of London the means of disciplining the dissolute of his American clergy, for if he could not bring them to ecclesiastical trial he could cut off any support drawn from the society. The influence of this propaganda was seen in the increased number of ordained men sent to the colonies and their greater respectability for learning and character.

At the opening of the Revolutionary War a peculiar church polity had become firmly established. It was that of lay control of temporalities in the colonies. Thus it was not in the power of any spiritual authority to force a minister upon an unwilling parish. So, too, when later on the church came to organize on an independent basis, the laity were recognized as a fundamental factor in government. The causes of this in the South lay in establishing the church. When glebes were granted by law in 1619 to four parishes in Virginia, the administration of the property was put in the hands of vestries. Moneys paid out of taxes were intrusted to vestries in Virginia and the Carolinas. When Trinity Church was organized in New York the arrogant governor, Fletcher, demanded of the legislature the right to appoint or remove its minister, but the legislature denied it to him and gave the right of presentation to the vestry and wardens, and even authorized Episcopal parishes to settle rectors over them who were not in Episcopal orders. In 1748 the legislature of Virginia settled a long series of litigations on the part of clergymen to recover tithes and stipends by finally conferring on vestries the patronage of their respective livings, and it was this act which put an end to promising negotiations of the Bishop of London with the government to

give America an episcopate. The government declined because these vestries intercepted the prerogatives of the crown. Now these colonial vestries were the rate-payers of the parish, as was then the custom of England. Subsequently to the Revolution, in most dioceses the corporate body was made to consist of the wardens and vestry; in some the rector is added, so that without him the vestry cannot transact business when the living has such an incumbent. In some dioceses the rector has no seat with the vestry at all. In others, business may be done in his absence. In no diocese is the rector a corporation sole with a life interest in the temporalities, as is the case in England. This recognition of the lay element is a great departure from the practice of the mother-church, in her convocations.

At the close of the Revolutionary War there were about eighty parochial clergymen in the United States, those not at the head of the few strong city parishes being the missionaries of the Society for the Propagation of the Gospel. From them the society withdrew its stipends. There were also a considerable number of ordained men, who, in those unsettled times, had fallen into evil ways, and had ceased to officiate, and there was no one to call them to account. During the war many Episcopal ministers retired or fled from the country. Suspicion of their patriotism attached to them, because taking orders in England involved subscriptions of loyalty to the church of that country at a time when non-conformists were being proscribed by law and the court was jealous of its prerogative. To most colonists an Episcopal minister represented a foreign church. The disputes of the Colonies with Parliament and the Crown enhanced this distrust, although some of the most conspicuous of the parochial clergy were outspoken patriots. As a consequence of these things, when the war-clouds rolled away, this church was depressed with poverty, unpopularity and disorder.

Obtaining the Episcopate. There are some local traditions that John Talbot, of Burlington, New Jersey, and a Mr. Walton, of Philadelphia, obtained consecration of the nonjuring Scotch bishops early in the eighteenth century, but sound church historians do not give the tradition credit. If it were true, the men are not known to have exercised episcopal functions.

In 1783 ten clergymen of Connecticut met secretly at Woodbury and agreed to send one of their number to England to ask for the episcopate there, but with instructions to seek it in Scotland if denied in London. They chose Samuel Seabury, who had been a chaplain to a Tory regiment in New York and was for the rest of his life on the retired pay-roll of the British army. The statutory requirement that a man must take the oath of royal supremacy as a prerequisite to consecration in England barred his way to the English succession, and he turned northward. On Nov. 14, 1784, he received consecration from the Scotch bishops in the house of Bishop Skinner of Aberdeen. He returned and settled in New London, exercising his functions in Connecticut and Rhode Island. He participated in one consecration, that of Clagett of Maryland, and there were then present the three bishops in the English line; yet he had a very marked influence on the development of the Protestant Episcopal Church. Stiff Anglicanism prevailed in Connecticut; the Middle and Southern clergymen were latitudinarian or evangelical.

At a gathering of a few clergymen in New Brunswick in 1784, plans were formed for the meeting of a convention in Philadelphia the next year. One of the first considerations was to settle upon the constituency to be represented there. There was a considerable number of men in orders whose habits were, at least, not to edification, and their number was likely to be increased by the arrival of others desirous of escaping the ordinary at home. Lists were made of the clergymen of character to be recognized outside of Seabury's diocese, and they were invited to attend, as well as a number of eminent laymen. The convention of 1785 represented seven Southern and Middle states, the presence of the laity then being a novel feature, and one not acceptable to Connecticut. One of the first steps taken was to organize standing committees for each state, to act as ecclesiastical authorities until bishops should be obtained. These committees were to make up clerical lists, certify to each clergyman his right to be recognized as a minister of this church, and all others who lacked this certificate were prohibited from officiating in any congregation of the church under penalty of being advertised as impostors. Thus arose a new feature of polity, the "standing committees" common to every diocese from that day. They comprise usually four laymen and four clergymen; are a council of advice to the bishop and the administrators of the diocese when the bishop is away or the office is vacant. They certify the testimonials of all candidates for ordination, and in the recesses of the general convention must confirm or reject every nominee for a diocesan episcopate before he can be consecrated. They also present a clergyman for trial.

The convention which instituted this unusual and excellent system also drew up a constitution establishing a general convention to meet triennially, and to be composed of equal numbers of clerical and lay delegates from each diocese, and of a house of bishops when the church should possess three prelates. The two houses were to concur in legislation, and the lay delegates had a veto on the clerical vote when votes were taken by orders. The convention also put forth the *Proposed Book of Common Prayer*, which, under the influence of the peace-loving, latitudinarian White, was in substance the English book relaxed in dogma favorably to dissenters and adjusted to new political conditions.

In 1787, Parliament having authorized it, William White and Samuel Provoost were consecrated on Feb. 4th, in Lambeth Chapel—the one, bishop for Pennsylvania, and the other, bishop for New York. Meanwhile, the American Church had given guarantees to the Archbishop of Canterbury that it neither desired to nor intended to "depart from the Church of England in any essential point of doctrine, discipline or worship, or further than local circumstances require." In 1790 James Madison

was consecrated at Lambeth for Virginia, and the Anglican line of succession was canonically established in America.

CONSTITUTION AND ORDER. In 1789 a second convention, properly the first general convention of the church, was held, and Bishop Seabury, with a delegation from New England, joined in it; yet the three bishops sat and voted with the deputies. The constitution, as finally framed, is substantially as above described. The general convention is the supreme legislative authority; the standards of faith (though little reverence is paid to the Thirty-nine Articles in practice) and the rule of worship are in the *Book of Common Prayer*, and these are regarded as unalterable as to their substance, though rubrics and minor ritual methods may be changed. A bishop can only be tried by his peers, and the process is intricate. Each diocese is constituted on the plan of the general convention, has entire control over the discipline of priests and deacons, and votes by orders. The subscription of the clergy to the formularies is relaxed, and the candidate for orders, instead of declaring his *ex animo* assent to them, after the English usage, is required to make the more negative promise of conformity to the doctrine and worship of the church.

The *Prayer-Book* as revised in 1789 was a return from the *Proposed Book* to the English model. To it Seabury succeeded in adding the invocation from the Scotch Communion office, giving a high eucharistic quality to it. It omits the so-called Athanasian creed, provides a form of family prayer, and later there were added a *Form for the Consecration of a Church or Chapel* (1799) and one for the *Institution of Ministers* (1804). A final revision of this book began in 1883, and was nine years in progress. It aimed only at liturgical enrichment and a greater flexibility of services. The changes had no doctrinal significance. This church puts forth its own hymnal, and it is one of the best collection of hymns extant for dignity and lyric force.

RECENT HISTORY. In trying to be a national rather than a dogmatic organization, the Church of England became comprehensive. Puritan and prelatist, Calvinist and Arminian at first fought in it fiercely; but it was in it, and each party asked, not for toleration, but domination, until the time of William III. Its breadth no bitterness of the schools has wholly obliterated, though the partisan leaders would at times, if they had their way, mar its fair catholicity. The great mass of Episcopalians cleave to a dogma, not clearly stated in the church's confessions, and only inferentially gathered from its rubrics and canons. It is that a tactual succession of bishops from apostolic times is vital to the being of a church, and only episcopally ordained men can administer valid sacraments. Only those who do not believe this dogma are made unwelcome to the hospitable embrace of this communion. By law, in the Church of England, a minister of a Protestant continental church may hold a living in that communion, if he can find a patron to collate him to it, but no Dissenting clergyman of the realm may do so. This seeming paradox grew out of the national character of the church. It was friendly to national churches; it looked upon dissent at home as seditious. Not until 1868 did the Protestant Episcopal Church finally and definitely exclude from occasional ministrations in its congregations men not in episcopal orders. At that time a Mr. Hubbard had been brought to trial in Rhode Island for inviting a Baptist minister to pronounce the absolution in his parish church. The canon already mentioned, formed to exclude unworthy Episcopal clergymen from service in the church, had undergone some verbal re-arrangement and its primitive purpose no longer existed. It was alleged that Hubbard had violated it, but the court acquitted him on the ground that the canon did not contemplate such an act at all, or had no relation to the invited services of ministers of other denominations. At that time the General Convention was in session and the canon was reconstructed, so that its prohibition of ministrations of clergymen not in Episcopal orders should thereafter be undoubted. In 1867 Charles E. Cheney was tried in Illinois for having omitted to pronounce infants regenerated by the Holy Spirit in baptism, according to the formulary of the baptismal office, and suspended. Suspension ended in six months in deposition because he would not promise to conform. In 1891 Howard MacQueary was forced from the ministry in Ohio for calling in question the miraculous conception of Christ and the resurrection of the body. All these trials were in diocesan courts, from which there has thus far never been provided any appeal, except to the diocesan bishop. Hence it is quite possible that what is heresy in one diocese might be found orthodox in another. Were the church at all given to heretical prosecutions, the lack of an appellate court might be found to be of disintegrating consequence.

In 1819 the General Convention created a Domestic and Foreign Missionary Society. It was a compromise between the High and the Low churchmen of that day. The Low party had upbraided the piety of High churchmen as not sturdy enough to seek the conversion of the heathen, to which reply was made, "We wish first to take possession of the United States." By tacit arrangement, foreign missions were intrusted to the Evangelicals and domestic missions to the Anglicans. But domestic missions made dioceses and dioceses made the General Convention. The consequence was, that the Low-church party steadily declined until it may almost be said to have no organization save some inactive or small societies. In their place arose a Broad-church school to contend for the comprehensiveness of the church, and it is naturally antagonized by ritualists and evangelicals.

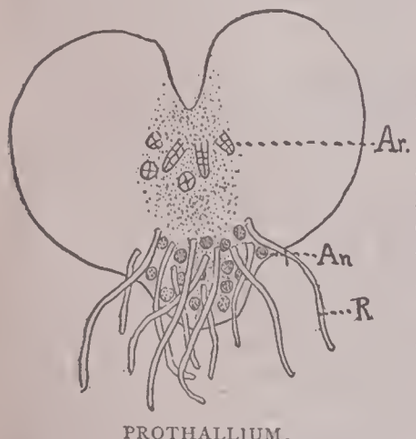
In 1835, stirred by the splendid generalization of Bishop Doane, that "the church is a missionary society and every baptized person is a member of it," the General Convention reorganized the Missionary Society. Every bishop is a member of its board, and the convention appoints upon it clerical and lay representatives for every diocese. It meets every three years and intercalates its sessions with those of the General Convention.

STATISTICS. The diocesan and missionary reports

to the triennial General Convention of 1894 resulted in the following statistics:

There were 52 dioceses and 18 domestic missionary jurisdictions. China, Africa, Japan and Haiti had missions with resident Episcopal supervision; Cuba, Greece and Mexico had missions under the supervision of an appointed diocesan bishop at home. At that time there were 78 active and 3 retired bishops; 4,323 priests and deacons; 4,870 organized parishes and missions; 580,507 communicants, and 400,566 Sunday-school scholars. The total contributions for the preceding year were over $12,000,000; $211,000 was raised for domestic and $158,000 for foreign missions. There were 4 religious orders for men, 22 sisterhoods and 5 communities of deaconesses. The theological seminaries are: the General Theological Seminary in New York, under control of the General Convention, and of those not so controlled, one each in Middletown, Connecticut; Geneva, New York; Philadelphia, Pennsylvania; Cambridge, Massachusetts; Davenport, Iowa; Washington, District of Columbia; Nashotah, Wisconsin; Syracuse, New York; Faribault, Minnesota; Alexandria, Virginia, and Chicago, Illinois. There are eight colleges under denominational control: Griswold, at Davenport, Iowa; Hobart, at Geneva, New York; Kenyon, at Gambier, Ohio; Lehigh University, at South Bethlehem, Pennsylvania; Racine College, at Racine, Wisconsin; St. Stephen's, at Annandale, New York; Trinity at Hartford, Conn.; and the University of the South, at Sewanee, Tenn. In 1907 there were 7,567 churches, 5,258 clergy and 846,492 communicants. D. O. Kellogg.

PROTHALLIUM, the name applied to the gametophyte of ferns and their allies (*Pteridophytes*). The ordinary leafy plant is the sporophyte, which produces spores upon its leaves, but bears no sex organs. When the spores germinate they produce a distinct plant, the prothallium (gametophyte), which bears the sex organs The accompanying figure represents the prothallium of an *Aspidium*. It is a small, flat, green body, whose lower surface is shown in the figure. The female organs (archegonia) are represented at *Ar*, the male organs (antheridia) at *An*, and the roots (rhizoids) at *R*. See Reproduction, Vol. XX, p. 442; and Alternation of Generations and Morphology, in these Supplements.



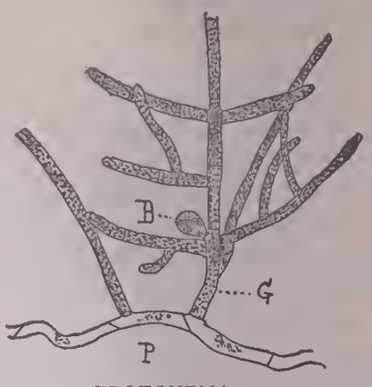
PROTHALLIUM.

PROTISTA. See Protozoa, Vol. XIX, p. 853.

PROTOCOCCOIDEA. See Vegetable Kingdom, Vol. XXIV, p. 137.

PROTOGYNY, a botanical term applied to those cases in which the stigmas of a flower mature, as shown by being ready to receive pollen before the anthers are mature, as shown by shedding pollen. In such a case the stigmas must receive pollen brought from some older flower. See Pollination, in these Supplements.

PROTONEMA, a term applied to that alga-like branching structure in mosses, which develops directly from the spores, and upon which the leafy plants arise as lateral shoots. The accompanying figure represents the protonema of *Funaria*, which has developed from one of the spores shed from the capsule. The green (chlorophyll-containing) part is that which is shaded in the figure (*G*), while the colorless or brown part (*P*) was beneath the substratum and away from the light. At *B* is a bud which develops into the leafy axis known as the ordinary moss plant.



PROTONEMA.

PROTOPHYTA. See Protozoa, Vol. XIX, p. 853.

PROTOPLASM, Animal. See Embryology, in these Supplements.

PROTOPLASM, Plant. See Morphology, in these Supplements.

PROTOPTERUS. See Lepidosiren, Vol. XIV, p. 468.

PROTOTHERIA. See Mammalia, Vol. XV, p. 374.

PROTRACHEATA. See Myriapoda, Vol. XVII, pp. 123, 124.

PROUT, Father. See Mahony, Francis, Vol. XV, pp. 290, 291.

PROVERBS. A proverb is an old and common saying, which contains some well-known truth or fact ascertained by experience or observation. It is generally short and pithy, with an undercurrent of wit. A saying, to be a proverb in the common acceptation of the term, must be in popular use, and must be of such sense and construction as to permit of its being used to express and illustrate more than a specific idea. If a saying, although brief and pithy, be only applicable to use in some one line of conversation, it is not, strictly speaking, a proverb. A proverb to be a proverb must be of such long and general use that it is marked with the stamp of approval and accepted by the people. A wise man's saying may be ever so wise, pithy and pointed, but it is only *his* saying, and nobody is bound to take it as a settlement of any question. In this respect proverbs and ballads are precisely on the same basis: they derive their authority from popular suffrage. But there is a difference between them, that the ballad had a maker, but no one man ever made a proverb. He may have made the original saying, but the forces that made the proverb were entirely beyond his control. Proverbs travel from family to community, from community to nation, and from nation to the world. A great number of modern proverbs are of Eastern origin—have come from the Arabic and Persian to the English. A proverb, it is said, gives its own origin from the sense conveyed by it and the method of the saying; it reflects the people with whom it originated.

Taking proverbs from a national standpoint, the Spaniards rank first; the number is prodigious. The Anglo-Saxon countries of continental Europe were rich in proverbs. The Norse had numerous proverbs. The literature of Iceland is an evidence of this. The Celtic and Gaelic, while numerous, were lacking in originality, many of them being borrowed from the Norse. The Teutonic group of nations had their proverbs in common, with provincialisms cropping in. Of the nations of the East, the Arabs hold first place, followed closely by the Persians, Hindustani and Turks. The Malay prose literature in popular use is composed almost entirely of proverbs. Collections of proverbs of every nation have been made, and are an interesting study. Arabic collections were made as early as the eleventh century, while in the nineteenth century the collecting has found votaries and made rapid progress in every country.

For collections of proverbs, English and foreign, see Bohn's *Handbook of Proverbs;* Bohn's *Polyglot of Foreign Proverbs;* Christy's *Proverbs and Phrases of all Nations;* Hazlitt's *English Proverbs and Proverbial Phrases.*

For the Biblical proverb, see Book of Proverbs, Vol. XIX, pp. 904 et seq.

PROVIDENCE, capital of Rhode Island. The predominant interest of Providence is no longer commerce but manufactures, the census of 1900 ranking it high among American cities in the value of its products; 1,933 industries reported. These had an aggregate capital of $83,513,000, employed 42,693 hands and had annual products averaging $88,168,897. Out of the total, the value of the cotton products was $3,355,000, this being one of the chief cotton markets of the Northern states; the woolen and worsted goods, $18,375,000; the jewelry products for the year amounted to $12,719,124, and the foundry and machine shop products, $9,437,251. An extensive system of street-railways, comprising 45 miles of track, connects all portions of the city and suburbs with the center. The Providence Telephone Exchange, organized in 1879, controls over fifteen hundred miles of wire. The city is lighted both by gas and by electric light. It has also an extensive system of water-supply and sewerage. There are 15 newspapers, four being dailies. In the ratio of its valuation to its population, Providence ranks as one of the wealthiest of American cities. Brown University (q.v.) is located here. Population 1890, 134,146; 1900, 175,597. See also Providence, Vol. XIX, pp. 909, 910.

PROVINCETOWN, Massachusetts, a town and summer resort of Barnstable County, occupying the northern extremity of Cape Cod Peninsula, opposite Plymouth on the mainland side of Cape Cod Bay, and reached by rail from Harwich, 30 miles to the south. It was one of the landing places of the Pilgrim Fathers; has a well protected land-locked harbor inside Cape Cod and has been a busy sea-fishing center from early colonial times. Population, 1890, 4,642; 1900; 4,247. C.L.S.

PROVO, Utah, a river flowing into Utah Lake near Provo City, after a west by south course of 160 miles from its source in Bald Peak, one of the Uinta Mountains. Its waters are utilized for irrigation. C.L.S.

PROVO CITY, a city and the capital of Utah County, central Utah, on the Provo River, near Utah Lake, and on the Salt Lake and Los Angeles and the Union Pacific railroads, 40 miles S. of Salt Lake City. It is the trade-center of a rich farming region, which produces wheat, barley, grass, live-stock, etc., and an important manufacturing and shipping point for flour. Several tanneries and flour-mills are located here. Population 1890, 5,159; 1900, 6,185.

PROVOOST, Samuel, an American clergyman; born in New York, March 11, 1742. He graduated at King's College (now Columbia University) in 1758, and later studied at St. Peter's College, Cambridge. He was ordained priest in 1766, and became assistant minister of Trinity Church in December of that year. Two years later he retired to a farm in Dutchess County, and occupied himself in literary and scientific pursuits. After the war he was chosen rector of Trinity Church, a position he held for nearly 17 years. He was elected bishop of New York in June, 1786, and, with the assistance of a coadjutor, held that office till his death, which occurred in New York, Sept. 6, 1815. E.E.T.

PRUDDEN, Theophil Mitchell, physician; born in Middlebury, Conn., July 7, 1849; was graduated at Sheffield Scientific School in 1872. He was professor of pathology in the College of Physicians and Surgeons, New York; contributor to medical magazines, and author (with Dr. Francis Delafield) of *Manual of Normal Histology; Story of the Bacteria; Dust and Its Dangers; Water and Ice Supplies*, etc. He received the degree of LL.D. from Yale University in 1896. He is a member of the National Academy of Sciences. G.J.H.

PRUSSIA, Kingdom of. (For general article giving geographical, geological, and historical descriptions, see Prussia, Vol. XX, pp. 5–24.) In 1820 the income of the King of Prussia was fixed at $1,930,824. Previous to that time the king enjoyed the entire income of the state domains. In 1859 an additional allowance was made, and again in 1868 and 1889, until in 1895 the king's total income was $3,852,720, as far as it figured in the budget. But in addition, the reigning house controls many castles, forests, and estates from which a large revenue is derived. The area of Prussia is reported officially as 135,134 English square miles. The population in 1905 aggregated, in the 14 provinces, 37,293,324. The average density per square mile was 275.9. The area at the close of the reign of Friedrich I, King of Prussia, in 1713, was about 43,400 square miles; in 1797, the area was 118,030 square miles; from 1816 to 1858, 106,614; from 1858 to 1867, 108,514; in 1890, 134,603.

Of the total population in 1900, 51.4 per cent lived in towns. The population included 16,971,472 males, and 17,501,084 females, or 103.12 females per 100 males.

AREA AND POPULATION BY PROVINCES.

PROVINCES.	AREA IN SQ. MILES.	POPULATION, 1900.
East Prussia (Ostpreussen)	14,282	1,994,626
West Prussia (Westpreussen)	9,854	1,563,658
Berlin	25	1,888,848
Brandenburg	15,381	3,108,554

Dantsic (Danzig)	140,539	Liegnitz	54,839
Aachen	135,235		

CONSTITUTION AND GOVERNMENT. The Constitution of Prussia has undergone many revisions. The last two were on Feb. 19, 1879, and May 27, 1888. The fundamental laws vest the executive and part of the legislative authority in the king, who attains his majority at the age of eighteen. The crown is hereditary in the male line, and in the order of primogeniture. In the exercise of the government the king is assisted by a council of ministers appointed by royal decree. The legislative authority the king shares with a representative assembly, the Landtag, composed of two chambers, the first called the "Herrenhaus," or House of Lords, and the second the "Abgeordnetenhaus," or Chamber of Deputies. The assent of the king and both chambers is requisite for all laws. Financial projects and estimates must first be submitted to the second chamber, and either accepted or rejected *en bloc* by the upper house. The right of proposing laws is vested in the government and in each of the chambers.

The upper chamber is now composed of, first, the princes of the royal family who are of age, including the scions of the formerly sovereign families of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen; secondly, the chiefs of the mediatized princely houses, recognized by the Congress of Vienna, to the number of 16 in Prussia; thirdly, the heads of the territorial nobility formed by the king, and numbering some fifty members; fourthly, a number of life peers, chosen by the king from among the rich landowners, great manufacturers, and "national celebrities"; fifthly, eight titled noblemen elected in the eight older provinces of Prussia by the resident landowners of all degrees; sixthly, the representatives of the universities, the heads of "chapters," and the burgomasters of towns with above 50,000 inhabitants; and, seventhly, an unlimited number of members nominated by the king for life or for a more or less restricted period.

The second chamber consists of 433 members—352 for the old kingdom, 80 added in 1867 to represent the newly-annexed provinces, and 1 in 1876 for Lauenburg; the proportion to the population in 1895 was 1 to every 73,569.

The king of Prussia and his chief ministers of state are the same as those of the German Empire (q.v., in these Supplements).

EDUCATION. Education continues to be compulsory in Prussia. Schools have local support with state aid. All parents must have their children properly taught or send them to one of the elementary schools, in which all fees are now abolished. No compulsion exists in reference to a higher educational institution than elementary schools. The school age is from 6 to 14, and the number of that age in 1896 was 5,654,918. In the budget of 1901–02, the sum of $31,868,850 was appropriated for instruction. Of this sum, $3,704,000 was for science, art, and technical instruction.

EMIGRATION. In 1892 the emigration from Prussia by German ports, Dutch ports, and Antwerp reached a total of 76,196; in 1893, 53,471; in 1894, 24,203; in 1895, 20,564; in 1896, 19,459; 1897, 13,497; 1903, 21,907; and in 1906, 18,083.

FINANCE. The budget estimates for the year ending March 31, 1901, placed the revenue at $618,066,500, and the total expenditure at the same amount.

The national debt of the kingdom, inclusive of the annexed provinces, was, according to the budget of 1900–01, $1,650,700,616.

The charges for interest, amortization, and management of the debt amounted to $68,236,876 in the same financial year (1900–01).

The debt amounts to about $47.08 per head of population, and the annual charge to about $2.00 per head. In 1890 the total of incomes was estimated at $2,500,000,000, and the average per head $85.50. The income-tax averages about sixty cents per head of population. Since April, 1895, only the income-tax and a new tax (Vermögenssteuer) are direct state taxes.

PRODUCTIONS IN 1899–1900. Among the summaries of the reports were the following: Establishments for manufacturing beet-sugar, 308; which consumed 9,767,741 metric tons of beet-root, in the production of 1,339,270 metric tons of raw sugar. There were 5,103 breweries in operation, brewing a sufficient quantity of beer to supply 22.44 gallons yearly to every inhabitant of the kingdom.

The coal-mines reported an output in 1900 of 101,966,158 tons. Prussia yields about half of the world's annual production of zinc, 155,760 tons.

*Heligoland has been attached to Schleswig-Holstein since 1891.

Yield of lead, 116,995 tons; copper, 30,902 tons. Total value of mining products in 1906, $356,979,000.

PRYOR, Roger Atkinson, an American jurist and public man; born in Dinwiddie County, Va., July 19, 1828. He graduated at Hampden-Sidney College in 1845, and at the University of Virginia in 1848; was admitted to the bar, and practised a short time in Petersburg. He was engaged in newspaper work in Washington and Richmond, 1852–55; was special commissioner to Greece, 1855; returned to the United States and established *The South* in 1857, and later joined the staff of the Washington *States*. He was a Representative in Congress from Virginia from Dec. 7, 1859, to March 3, 1861; joined the Confederate army as colonel in 1861, and was brevetted brigadier-general in 1863; was a member of the Virginia (Confederate) House of Representatives, 1862; and was a prisoner of war in Fort Lafayette, 1864–65. After the close of the war he practised law in New York, and in 1890 was elected to the bench. E.E.T.

PSYCHICAL RESEARCH, Society for. See Telepathy, in these Supplements.

PSYCHOLOGY is the study of the phenomena that arise within the domain of the human mind, or in other words, of the facts of consciousness. Inasmuch as the content of the mind is the sum of a man's knowledge, for what is not presented in consciousness does not exist for an individual, it is evident that the science of mind is an all-embracing one. It is true that psychology is not concerned with the contents of the mind, but only with the way in which the mind acquires and deals with them. Still, the relation of the mind to its entire world of facts is not only a very large field for investigation, but, in many particulars, an obscure and debatable one. Confusion is increased because, as yet, psychologists lack a precise terminology, such as makes other sciences exact. Again, the subject is implicated with other fundamental departments of thought, and it also breaks up into various branches, while it is approachable from many standpoints. All metaphysics, or speculative philosophy, takes its origin in the mind, and with it the grounds of religion are laid. There could be no metaphysic if there were no mind; there could be none were mind proved to be a physiological result, for then mind would be purely material and metaphysic would become identical with physics. Speculative philosophy begins with assumption of the Ego or subject. It develops through a determination of the constitution of the Ego or of mind, and of its intuitions and categories. Upon these, and the question whether volition is determined or free, depends the authority of religion and the validity of morals.

Now, it is possible to free psychology from all speculative considerations, and to restrict it simply to the study of facts as they arise in consciousness, without inquiry as to the nature of the mind, just as it is possible to classify plants without attention to vegetable physiology, or to study mechanics without inquiry into physics. It is concerned with the *how*, and not the *why*. In point of fact, it is just this restricted research that constitutes the science of psychology to-day. Such is the presentation of this subject in the article on Psychology, in Vol. XX, pp. 42–90, of this Encyclopædia. That article carefully marks the line which separates physiology from psychology. It belongs to the school of British thought, is especially influenced by the philosophy of the Realistic or Scotch Common-Sense reasoners, and owes but little to the German psychologists of the Wundt or physiological school. It is written rather on the lines of introspection, assuming the existence of the Ego as subject, taking the normal individual for its standpoint, laying a basis in its categories for intuition, and leaving the freedom of the will in a limited limbo. (See pp. 42, 44, 49, 72, 79, and 88.) This does not materially affect its results, for experimental psychology has not yet grown to an impeachment of them, and in them the pedagogist will find all the material commonly used in the scientific consideration of education. It may be classified as belonging to both the *empirical* and the *introspective* school, the first of which is defined as "the study of observed facts of consciousness and of their laws, without attempting to account for them by underlying principles," and the second as "based on introspection, or the observation of personal consciousness."

It will be clear, on reflection, that speculative philosophers, theologians, and orthodox moralists will hardly leave so fundamental a province as psychology without a theory and a method. From the days of Chilon, one of the "Seven Sages of Greece," his injunction, "Know thyself," has had a profound and fundamental relation to philosophic thought. For centuries psychology had its devotees, but they treated it as a part of metaphysic. When it began to be separated from speculation, and made a special branch of study, as in Locke's *Essay Concerning the Human Understanding*, it came to be known as "Mental Science." Under this title it passed into the curriculum of schools and colleges, and it was not until the middle of the nineteenth century that the term "psychology" came into English vogue, chiefly through the influence of the works of the Germans, Carus and Herbart. Until within recent years, mental science was more or less compromised with philosophy and ethics, and its expounders continued to seek the "underlying facts of consciousness, or to derive such facts *a priori* from the concept of the soul." This school has been called that of *rational psychology*, but its methods and postulates have become obsolete, although it did much to clear the way for those who came after.

For additional facts on this subject, see Hickok's *Empirical Psychology;* Porter's *Human Intellect;* McCosh's *Truths;* Spencer's *Education;* Bain's *Education as a Science;* Payne on *The Science and Art of Education;* Baldwin's *Handbook of Psychology*, and *Mental Development in the Child and the Race;* and Sully's *Teacher's Hand-Book of Psychology.*

PSYCHROMETER, an instrument for measuring the relative humidity of the air. (See HYGROMETER, Vol. XII, pp. 604–605.) It consists of two thermometers, a wet bulb and a dry bulb. The *sling* or *whirled psychrometer* is moved swiftly through the air to insure more rapid evaporation.

PUBLIC LANDS OF THE UNITED STATES are lands which are owned by the government. The term, in its wide and general usage, has especial reference to such lands owned by the government as are open to sale, or any other method of disposal, to persons who will comply with stipulations of the law. In 1893 the total area of United States vacant lands was estimated at 568,000,000 acres, located in 25 states and territories. Much the largest part of these lands was west of the 100th meridian, and 542,000,000 acres (or 95 per cent) were in states and territories west of the Dakotas, Nebraska, Kansas and Texas. East of these states there were 26,000,000 acres, located partly in the swamps of Florida and Louisiana, and partly in Arkansas, Michigan, Wisconsin and Minnesota, in what have, in the past, been widely represented as non-agricultural regions. The exhaustion of the more attractive and desirable public prairie-lands has, however, turned attention toward the others, particularly in the three Northern states mentioned, and, upon investigation, the so-called pine-barren and alleged worthless lands are, in many cases, proving to be quite otherwise.

In 1890 there were 12,798,837 acres disposed of by the government. The figures dropped, in 1891, to 10,477,700 acres, and in 1892 again rose to 13,664,019 acres. Therefore, taking the annual average disposal at 12,000,000 acres, and supposing all the vacant land to be susceptible to entry, it would all be taken up in fifty years. As a matter of fact, however, only a small portion of the vast area can be acquired under the present laws, or is now suitable for homestead purposes. A great deal of it consists of high mountains, lava-covered plains or eroded plateaus, or is otherwise too rough. The portions which are now, perhaps, the choicest—in that they possess a rich and deep soil—are, for the most part, valueless at present because of aridity. It has been possible to redeem portions of these lands through irrigation; but the area within reach of a visible water-supply is small, and, at the present rate, will all be gone in a few years. Speculations as to the length of time before it will become exhausted have led the public attention to the questions bearing upon their reclamation; inasmuch as men are now, every year, more and more disposed to take lands which, a few years since, were regarded as undesirable. Therefore, the amount taken from year to year must now diminish, not because of a decreasing demand, but through an inadequate supply. The eleventh census shows that the area irrigated in 1889 was 3,631,381 acres, which area was located in scattered patches between the 100th meridian and the Pacific Coast. The total land-surface in this area, which possesses almost every imaginable combination of soil and climate, is (deducting 36 counties in western Oregon and Washington) 883,312,000 acres, and the area irrigated is only four tenths of one per cent of the enormous territory. These lands may be divided into four classes; viz., desert lands, pasture-lands, timber-lands, and firewood-lands. 1. The desert lands are those areas where cattle are unable to obtain drink, and where the vegetation is so ephemeral as to be of little value for pasturage; the soil, however, is often rich, and when watered has given forth prolific crops. These "deserts," even in the natural state, are seldom entirely without vegetation, and often, during a brief portion of the year, are covered with a variety of verdure both surprising and beautiful. 2. The pasture-lands are the great plain and other regions (including the mountain valleys and parks) which are available for pasturage. 3. The timber-lands are the forest areas upon the mountains, where the trees are large enough for timber. 4. The firewood-lands are those which lie intermediate between the pasture-lands and the high slopes, which may be said to fringe the timber-lands, where the tree-growths are not large enough for timber use. It may be added, however, that there are scattered here and there within this area, called the firewood belt, certain strips and patches of land which are capable of productiveness without the aid of irrigation. The percentage of such lands cannot now be computed, and although not great as compared to the whole, still would amount to considerable in the aggregate. It will therefore be included in the firewood area. The divisions, therefore, are as follows:

	Acres.
Desert land	64,000,000
Pasture-land	620,912,000
Timber-land	83,200,000
Firewood-land	115,200,000
Total	883,312,000

Of this total, less than 568,000,000 acres still belong to the general government. The irrigated and irrigable lands are mainly included within the division known as pasture-land; and, in a general way, it may be stated that nine tenths of this area is covered with a fertile, arable soil which only lacks moisture to render it highly productive. These figures are partially assumed, but are based upon good grounds and careful estimates; and if they are proven, then, out of, say, 616,000,000 acres of arable lands within this pasturage area, less than three fifths of one per cent were irrigated in the census year. The reclaimability of the balance is simply a question of water-supply, and the providing of an adequate supply of water some time in the future is by no means to be regarded as a wholly visionary or impractical dream. The area of unappropriated public land was (1907) 774,385,069 acres, of which 236,838,749 were surveyed and 537,546,320 unsurveyed. For ways of acquiring public lands, see HOMESTEAD, Vol. XII, pp. 125-127; also,

under the *Timber-Culture* and *Desert-Land* laws, see UNITED STATES, in these Supplements.

PUBLIC SCHOOLS. See SCHOOL, PUBLIC, in these Supplements.

PUCCOON, a name applied to several plants of widely separated families: 1. Species of *Lithospermum*, a genus of *Boraginaceæ*, otherwise known as gromwells; 2. *Hydrastis Canadensis*, belonging to the family *Ranunculaceæ*, or crowfoots, and known as yellow puccoon; and 3. *Sanguinaria Canadensis*, a plant of the *Papaveraceæ*, or poppies, commonly known as blood-root. In all these cases the name has been given on account of the colored root-sap, which has been used more or less as a dye.

PUDDLING. See IRON, Vol. XIII, pp. 329–334.

PUEBLA, a state. See MEXICO, Vol. XVI, pp. 223, 226.

PUEBLO, a city of southern Colorado, and one of the most prosperous between the Rocky Mountains and the Missouri River, the capital of Pueblo County, Colorado. It is located on the Arkansas River, 115 miles S. of Denver, 40 miles E. of Cañon City, and is reached from all directions by the Denver and Rio Grande, Denver and New Orleans, Atchison, Topeka and Santa Fé, Rock Island, and other leading transcontinental railway lines. As a manufacturing city, railroad center, and in some other respects, Pueblo is second in importance to no city in southern Colorado. It is the location of the Colorado Coal and Iron Company, Colorado Smelting Company, Colorado Pressed Brick Company, Colorado Bridge Company, and many other undertakings owned and controlled by home capital. These embrace foundries and machine-shops, enterprises devoted to the manufacture of wire fencing cornices, brick, furniture, lumber, sashes, doors and blinds, carriages, buggies and wagons, agricultural implements, mining machinery, etc., representing heavy investments, and employing a large force of skilled artisans. It has three daily and several weekly papers, one private and two national banks, seven churches, a number of schools (graded and commercial), a large number of stores, eight hotels, two theaters, the State Agricultural Society and the State Asylum for the Insane. It is lighted by gas and electric lights, and a well-managed street-railway system affords the means of rapid transit throughout the city. Population 1890, 24,558; 1900, 28,157.

PUEBLO INDIANS OR PUEBLOS, families of North American Indians, found, in the sixteenth century, by the Spanish explorers in Mexico, New Mexico and Arizona. They are included in four linguistic families, representing 28 tribal groups, living in as many villages. These Indians were originally small people, the men averaging not more than five feet in height. The men were lean, rather sharp-featured, dark or tawny, expression mild and intellectual The women were fair olive. Their clothing was, for the most part, made of woven bark, yucca-fiber, cotton or cottonwood-down, fur and feathers. The men wore robes of rabbit-skin or catskin, or mantles of cotton elaborately striped and embroidered, buckskin tights, or else leggings made of strips of buckskin wound around the leg like a bandage, and fastened at the knee with garters of colored cotton yarn. Sandals of yucca, sometimes moccasins of buckskin with rawhide soles, protected the feet. The warriors wore helmets made from the skin of the bear, puma, antelope or bison; their shields were of basket-ware or rawhide; their weapons were lances, javelins, bows, clubs, knives of flint or obsidian, stone axes, and swords whose edges were of some flinty material. The women wore a sleeveless dress of cotton reaching below the knee, a mantle of embroidered cotton, a head-shawl, leggings and sandals, or for the house knitted stockings. Their hair was parted in the middle, and tied in two knots back of the ears for the married ones, and in two coils over the ears for the unmarried.

Their houses were clustered into villages, in form either rounded or oblong squares. They were several stories in height, the highest being on the outer side, the others descending in terraces to central open courts and alleys. There were no doorways in the lower stories, access being gained to the roofs of the houses by means of ladders, which could be raised at any time for protection from enemies. The houses themselves were entered through scuttles in the roofs. The upper stories had both doors and windows. Each house was divided into rooms, all of which were very small. Each household occupied three or four of these rooms. There was always a kitchen, a storeroom, and an eating and living room. The village was divided into wards of the same number as the tribal divisions, and each ward into quarters equal in number to the clans of each division. The women and children lived in the quarters, the men in large, partly underground chambers, one for each division of the tribe. In these chambers they held their councils, and labored at their looms, or made their weapons of war. In them they also amused themselves, taught the young the usages and traditions of their respective divisions, and settled disputes between the clans.

The men were the weavers and spinners. They irrigated the land and raised the crops. The women cared for the household, cooked the food, made pottery, baskets and utensils for the house. They also had small gardens just outside the village, where leeks, peppers and fragrant herbs were raised. The supply of meat is obtained by the divisions joining in round-ups of game. Dams, ditches and embankments for irrigation, at a distance from the village, are also made by the divisions working together, so as to be able to resist the attacks of neighboring tribes.

The tribes were composed of clans, and the clans of families of kindred. Each clan was named after some animal, plant or other thing, which name was the "totem" of the clan. Clans whose totems were analogous were grouped together to

make a division. Thus the Sunclan and the Eagleclan were in the same group, as the sun and the eagle both dwelt in the sky. Each group had its priest, chief or "medicine-man," who was the keeper of the powers of the spirit of the animal or thing of the region which his division represented. These divisional priest-chiefs were from four to seven in number. There were, also, secret societies, or cults, or fraternities, of these priests, the members of which were the teachers and keepers of the traditions, rituals, religious regulations, magic mysteries and medicines or powers of the divisions to which they belonged. Disease was believed to be of ghostly origin, and these priest-doctors not only treated it, but labored to avert it by charms, rituals and offerings. The gods of the Pueblos were celestial gods, ancestral gods, phenomenal gods and animal gods, equally of both sexes. There was the supreme god, the god of the sun-shield, and under him the god of fate and his brother, the god of war, the god of time, of the seasons, and the god of dawn. The Master of Life was the Messiah of the Pueblos, the mediator between the mortal-like gods and the celestial. The natural world was the offspring of the spiritual world, and the hot springs of Colorado were the umbilical connection between these two worlds; accordingly, the offerings to the Master of Life were addressed by the priests of the cult societies at this place. Spiritual worship was largely hygienic. The priests abstained from meat four days each month, and for a number of days at the summer and winter solstices. Shells, coral, beads, etc., were sacrificed to the gods, and incantations and dances performed before altars which symbolized some sacramental region. Offerings of food and other articles were made in the autumn season, in remembrance of the dead, and in November of each year festivals and celebrations of creation were held.

A man and a woman of the same clan were not allowed to marry each other; lovers could not be betrothed without the consent of the priest-chief. Before betrothal, a man could display his preference for the woman of his choice only in a general way; after betrothal, the maternal relatives accepted the man as a perpetual guest of the clan, which placed divorce chiefly in the hands of the women. After the birth of a child, birth-offerings were made, and after nine days the child was presented to the sun, and the clan name given by the clanspeople of the mother, to whom it belonged ever after. Upon the death of a person, he was renounced by the clanspeople of the mother to the clanspeople of the father by breaking a jar of water beside the body. Presents were given; and if the dead had been a priest, he was buried and the presents were burned, if not a priest, the body was burned with the presents.

There is evidence for believing that the Pueblos once lived in regions to the north and east of the arid regions where they were found by the Spaniards. Their tribes were driven into the deserts by stronger tribes. Cultivation by irrigation became a necessity, and fixed habitats followed as a consequence. They built their huts of wood and mud, then their houses of stone and mud, and grouped them around watering-places. Fixed in habitation, tilling the soil and acquiring food-stores, they attracted the attention of their enemies, who forced them to fly to the cañons and cliffs, where they became cliff and cave dwellers, and developed the terraced and cellular type of architecture, the building of their villages in one, known as a pueblo, the dividing it into quarters—the men from the women—so peculiar to these people at the time of the Spanish conquest. This same general plan is still followed in the modern pueblos.

The ruins of houses and villages, thousands in number, which indicate the presence and movements of these people, are found from central Nevada, Utah, Colorado and Texas, southward into Mexico. Many of them are buried under the sands, to be unearthed only by accident. By far the greater number of these ruins are found upon the banks of the San Juan River and its tributaries, and upon the mesas in this vicinity, the largest group being located in the upper part of Cañon de Chaco. It is estimated that at the time of the Spanish conquest these Indians numbered 30,000. The total population at the present time is about 10,000. The modern Pueblos are found in greatest number upon or near the banks of the Rio Grande del Norte. Zuñi is near the western border of New Mexico, while the seven Moqui villages are in the northeast corner of Arizona. See also INDIANS, Vol. XII, 866–867.

PUERPERAL FEVER, childbed fever, or technically, *Puerperal Septicæmia*, a continued fever occurring in connection with childbirth. It is an infectious disease, produced by the action of bacteria which destroy tissue or indirectly poison the patient by producing toxic substances which are absorbed. The septic matter may be communicated by the hands of the physician or nurses, or by sponges, napkins, etc. The presence of bacteria produces an inflammation, the results of which are found in the uterus, the tissues around it, the veins and lymphatics. The peritoneum is nearly always affected, and swelling, softening, or abscesses may be found in the uterus, ovaries, kidneys, spleen, liver, lungs, muscles, and other tissues. The disease may begin within three or four days after delivery, or later, with headache, occasionally with a chill. The pulse becomes feeble and rapid, 130 or more a minute; the temperature rises to 103° or higher. Vomiting may occur, and diarrhœa is often very persistent. The tongue is coated with a heavy fur, and a filthy crust forms on the lips and teeth. There is often acute pain, with tenderness and swelling of the abdomen. The mammæ are often hard and painful, and the secretion of milk is arrested. As the disease progresses, the breathing becomes short and hurried, pneumonia, pleurisy or jaundice may develop, and the joints may swell and suppurate. The disease generally runs a rapid course, ter-

minating fatally within a week. In the final stage a clammy sweat appears, with hiccough, twitching of the tendons of the wrist, and muttering delirium, the patient dying from exhaustion. The disease is of such a serious nature that its treatment should always be prescribed by a physician. But there are always indicated the application of antiseptic douches to the affected parts, nutritious food and stimulants to sustain life. See also *Septicæmia*, under PATHOLOGY, Vol. XVIII, p. 558.

PUERPERAL INSANITY. See INSANITY, Vol. XIII, p. 115.

PUERTO LAMAR. See COBIJA, Vol. VI, p. 82.

PUERTO PRINCIPE, a city of Cuba. Population 1902, 25,102.

PUFFBALLS, the common name of species of the *Gasteromycetes*, a group of saprophytic fungi with large and usually more or less globular spore-fruits. The spores are borne in cavities in the interior of the globular mass, and escape by the drying and rupturing of the surrounding tissues. The puffballs proper are species of *Lycoperdon*, some of which become very large, and all of which are more or less edible.

PUGATCHEFF, YEMELYAN. See RUSSIA, Vol. XXI, p. 108.

PUGET SOUND. See WASHINGTON, Vol. XXIV, p. 406.

PUGH, JAMES LAWRENCE, an American public man; born in Burke County, Georgia, Dec. 12, 1820. He received an academic education in Alabama and Georgia; was taken to Alabama when four years old, where he permanently resided; licensed to practice law in 1841 and was employed so when elected to the Senate. He was a Taylor elector in 1848, Buchanan elector in 1856 and state elector for Tilden in 1876; was elected to Congress without opposition in 1859; retired from Congress when Alabama seceded from the Union in 1861. He joined the Eufaula Rifles, in the First Alabama Regiment, as a private; was elected to the Confederate Congress in 1861 and re-elected in 1863; after the war, resumed the practice of the law; was member of the convention that framed the state constitution of 1875; elected to the Senate in 1880 and re-elected in 1884, and again in 1890. He died in 1907.

PUGILISM, the art or practice of boxing or fighting with the fists, especially as practiced in the prize-ring. In its milder form, under the name of boxing, contests of this character are described under WRESTLING AND BOXING, Vol. XXIV, pp. 725, 726.

Prize-fighting with bare knuckles has, with the advance of civilization, become illegal in nearly every country, and remarkable in this respect has been the advance and reform of popular opinion in America. Just as in England in Georgian days a prince regent would patronize the prize-ring, so in America a professional pugilist was at one time regarded as a species of popular hero. But the era of pugilism is past and gone. America has rivaled and outstripped the Old World in the number, and in many cases, in the severity of the criminal statutes of the separate states, rendering prize-fighting highly penal. But a few years ago the states with statutes directed against prize-fighting were less than half a dozen. In 1897 Nevada was the only state which had not legislated against degrading exhibitions of this character. In order to prevent the occurrence of prize-fights in less-settled districts, the Catron bill was passed through Congress Feb. 7, 1896, declaring prize-fighting illegal in the various territories, and prescribing severe punishments for the infraction of the law. Public opinion had become thoroughly aroused and decided against pugilists, and as a result of the rigid enforcement of the law, the year 1895 saw the principals in a contest of this description crossing to the neighboring republic of Mexico, where alone they were able to decide their differences. For those who care further to pursue the history of the "noble art of self-defense," as pugilism has been called, mention may be made of Egan's *Boxiana* (5 vols., 1818); *Fistiana* (1863); *American Fistiana* (1876); H. D. Miles's *Pugilistica* (2 vols., 1880); "*Pendragon's*" (Henry Sampson) *Modern Boxing* (1878); J. B. O'Reilly's *Ethics of Boxing and Manly Sport;* Pollock and Grove's *Fencing, Boxing and Wrestling*, in the Badminton Library Series (1889); and R. J. Allanson-Winn's *Boxing* (1890).

PUKHTO. See AFGHANISTAN, Vol. I, p. 213.

PULASKI, a village, one of the capitals of Oswego County, north-central New York, five miles from Port Ontario, on the lake of that name, 20 miles N.E. of Oswego, and 30 miles S.S.W. of Watertown, on the Rome, Watertown and Ogdensburg railroad; contains a courthouse and an academy; has two paper-mills, four flour-mills, two planing-mills, an iron foundry, a machine-shop and a cheese factory. Population 1890, 1,517; 1900, 1,493.

PULASKI, a village and the capital of Giles County, southern Tennessee, 67 miles S. of Nashville, on the Louisville and Nashville railroad; contains a jail, a courthouse and a fine town hall; also Giles College and the Martin Female College, two cotton-mills, two tanneries, and planing and flour mills. The village is in a farming and stock-raising district. Population 1890, 2,274; 1900, 2,838.

PULASKI, BOMBARDMENT OF FORT. This fort, situated on Cockspur Island, at the mouth of the Savannah River, defended the approach to the city of Savannah. During the Civil War it was bombarded and captured by the United States forces under General Gillmore. The besiegers used 36 pieces of artillery, placed along the shore of Tybee Island, at distances ranging from 1,650 to 3,400 yards. The first day's bombardment, April 10, 1862, lasting ten hours, made a partial breach, and to prevent the Confederates from repairing the damage by sand-bags, firing was continued throughout the night. The next morning the batteries were again opened and the breach rapidly enlarged, endangering the safety of the powder-magazine. At two o'clock the fort surrendered. The number of shots fired by the be-

siegers was 1,354, and of shells 4,221. In has been estimated that 110,643 pounds of metal struck the breached portion of the wall, equal to 2,458 pounds per lineal foot, and that the average distance of the guns from the wall was 1,687 yards.

PULASKI, Casimir, a Polish patriot and American revolutionary soldier; born in Poland, March 4, 1748. He fought bravely in fruitless endeavors to free his native country from the grasp of Russian tyranny, and, after a term of imprisonment under sentence of outlawry and death, fled to Turkey and thence made his way to France. In 1777 he arrived in Philadelphia bearing high recommendations from Franklin to Washington, and volunteered to serve in the American army. Four days after the battle of the Brandywine, in which he distinguished himself, he was commissioned commander of cavalry with the rank of brigadier-general. Later he organized a "legion" of cavalry and light infantry and joined Gen. Lincoln's command in the Department of the South. In the assault on Savannah, Ga., Oct. 9, 1779, he was mortally wounded, and, being borne on board the *Wasp*, died there Oct. 11, and was buried in the Savannah River. E.E.T.

PULITZER, Joseph, journalist, was born in Buda-Pest, Hungary, on April 10, 1847, received a classical education from private tutors, and came to America in 1863. He served as a private soldier in the Federal army in the closing year of the Civil War, and then settled in St. Louis, Mo., as a newspaper man. He was a reporter on the *Westliche Post*, edited by Carl Schurz, and later its managing editor and part owner. In 1878 he bought the *Dispatch* and the *Evening Post* of St. Louis and united them as the *Post-Dispatch*, which he still owns. Finally, in 1883, he purchased the New York *World*, made it the exponent of a "new journalism," and, in a short time, one of the best known papers in America. Since that time his chief attention has been given to the direction of the *World*. He has made the *World* an agency for the doing of some important public works, and in August, 1903, he gave the sum of $2,000,000 for the creation and endowment of a college of journalism as a department of Columbia University, New York. Mr. Pulitzer has long taken an active interest in politics, as a Democrat. He was a member of the Missouri legislature in 1869, and of the Missouri Constitutional Convention in 1874. He was elected a representative in Congress from New York for the term 1885–87, but resigned after a few months' service. He was a delegate to the Liberal Republican National Convention of 1872, and to the Democratic National Convention of 1880. W.F.J.

JOSEPH PULITZER.

PULKOWA, Observatory of The great observatory of Pulkowa, Russia, under its first director, W. Struve, who devised superior instruments, acquired great celebrity. Its work in the preparation of accurate catalogues of the principal fixed stars has been the standard for the world for many years. In 1885 a new refracting telescope of 30-inch aperture and 45 feet focal length was erected. The object-glass was made by Alvan Clark of Cambridge, Massachusetts, and the mountings by the Repsolds. The tube is cylindrical, of riveted steel plates, graduated in thickness from the center to its ends, and bolted by powerful flanges to a strong, short cast-iron central tube. A new feature of this instrument is the platform at the lower end, where an assistant can view the hour-circle by one eyepiece and the declination-circle by another, and where he can also set the telescope to any hour-angle by one wheel, or to any declination by another. The eye-end has a micrometer and its illumination for the position-circle, a finder, microscopes for reading the hour and declination circles, and an illuminated dial showing sidereal time, and driven by electricity from the sidereal clock. Provision is also made for the attachment of a spectroscope—all of which, on the authority of Otto Struve, are practical, and all that can be desired. The traveling-stages are the most manageable that have yet been devised. The driving-clock is constructed so as to be practically independent of the power applied to it, or of the force to be overcome. For general description, see Observatory, Vol. XVII, p. 734; and Telescopes, Vol. XXIII, p. 162.

PULLMAN, a town founded in 1880 by George M. Pullman, and since 1890 incorporated with the city of Chicago. It is situated 14 miles S. of the center of Chicago, on the west shore of Lake Calumet, and covers about five hundred acres of land. It is well laid out, and has a complete sewerage and water system, the drainage of the town converging to a central pool, from which the sewage is pumped to a farm three miles distant, and utilized there as a fertilizer. The town is beautified by well-kept open spaces and stretches, flower-beds and lakes. It has a good hotel, and in the Arcade Building a circulating-library and a small theater. In Pullman are located the car-shops of the Pullman Palace Car Company, employing about four thousand men; the Allen Paper Car-Wheel Works, Union Foundry, Standard Knitting Works, Terra-Cotta Works, etc., in all employing over six thousand hands. The ownership of all the dwellings is in the car company, the inhabitants being tenants. Provision is made, however, for those desiring to own homes to purchase them on lands adjoining the town. The best sanitary conditions and modern conveniences are secured for all, each paying a proportionate share toward the total cost of maintenance. At Pullman originated, in 1894, one of the severest and most widespread labor strikes of modern times (q.v., under *Strikes*, in United States, in these Supplements).

PULLMAN, George Mortimer, capitalist; born in Brocton, N. Y., March 3, 1831; acquired a public school education. In 1845 he became a clerk in a store and later was employed in the business of cabinet-making. In 1852–56 he was engaged in elevating buildings along the Erie canal. During this period he cleared about $6,000, with which he went to Chicago. His attention was there attracted to the sleeping cars in use on the Lake Shore railroad. These cars suggested to him the idea of a palace sleeping car. In 1859 the Chicago & Alton railroad gave him a contract to remodel two passenger coaches into sleeping cars. He then removed to Colorado, where he devoted himself to mining and other enterprises till 1863. In that year he returned to Chicago, and at a cost of $18,000 built the *Pioneer*, the first Pullman palace car, which made its maiden trip in Lincoln's funeral train. In 1867 he founded the Pullman Palace Car Company, which later had a capital of $40,000,000 and employed 14,000 persons. In 1880 he founded the town of Pullman, about twelve miles south of Chicago, of which it afterward became a part. He was connected with a number of financial and industrial concerns in Chicago and elsewhere. He died in Chicago, Ill., Oct. 19, 1897. G.J.H.

G. M. PULLMAN.

PULLMAN, James Minton, clergyman, brother of George M. Pullman, was born at Portland, New York, on August 21, 1836, and was graduated from the divinity school of St. Lawrence University, Canton, N. Y., in 1861. He became a Universalist minister, and was pastor of a church at Troy, N. Y., in 1861–68, of one in New York City in 1868–85, and since 1885 of one — the largest in America — at Lynn, Mass. He was secretary of the General Convention of the Universalist Church in 1870–78, and since 1886 he has been president of the Associated Charities of Lynn. He is also president of Dean Academy, Franklin, Mass., a director of the Massachusetts Prison Association, a member of the Massachusetts State Board of Charities, of the National Civil Service Reform League, of the Massachusetts Society for Promoting Good Citizenship, and of the National Conference of Charities and Corrections. He died in 1903. W.F.J.

PULLMAN CARS. See Railroads, in these Supplements.

PULMONARIA. See Horticulture, Vol. XII, p 259.

PULQUE, an intoxicating beverage of the Mexicans and of the inhabitants of Central America and some parts of South America, made from the fermented juice of various species of agave, mainly the maguey (*Agave Americana*), or American aloe. The sap of the plant contains much sugar, and as pulque, is milky, sour and ill-smelling, resembling thin buttermilk. The Mexicans consume large quantities of it, and pulque-trains run into the cities as milk-trains do in the United States. It was first made by the Aztecs. See Aloe, Vol. I, p. 525.

PULSE, in physiology. See Vascular System, Vol. XXIV, pp. 113, 114.

PULSOMETER. See Steam-engine, Vol. XXII, pp. 541, 542.

PULU. See Hawaiian Islands, Vol. XI, p. 473.

PUMPELLY, Raphael, an American geologist and author; born in Owego, N. Y., Sept. 8, 1837. He was educated at the Owego Academy, and studied science and mining engineering in Paris, and in Freiberg, Saxony, in 1854–60. He has made extensive journeys for geological and other scientific purposes in Corsica (1860), Arizona (1860), Japan (1861–63), China and Mongolia (1863–64), the Gobi desert and Siberia (1864–65), Michigan and western Ontario (1867–1901), and Missouri (1871–73); and is organizer of a physical-geographical and archæological exploration of Central Asia under the auspices of the Carnegie Institute. He was professor of mineralogy at Harvard, 1866–73; State geologist of Michigan, 1869–71; director of the Missouri Geological Survey, 1871–73; chief of division of the United States Geological Survey, 1879–81 and 1884–91; and organized and directed the Northern Transcontinental Survey in 1881–84. He made the explorations which resulted in the inauguration of the iron-ore industry of Michigan and western Ontario. He is the author of *Geological Researches in China, Mongolia, and Japan* (1866); *Mineral Industries of the United States* (1886); etc. E.E.T.

PURCELL, John Baptist, clergyman, was born in Ireland on Feb. 26, 1800, and came to America at the age of eighteen. He studied at Mount St. Mary's College, Emmittsburg, Md., and in France, and in 1826 was ordained a priest of the Roman Catholic Church in the church of Notre Dame, Paris. He became a professor in and president of Mount St. Mary's College, and greatly developed and strengthened that institution. In October, 1833, he was called from the college and consecrated as bishop of the diocese

of Cincinnati — which then embraced all of Ohio and Michigan. In 1847, at his request, the diocese of Cleveland was set off from it, and several others were afterward similarly formed. He did an enormous work for the extension of the church and for the creation of schools, asylums and other institutions. He founded the theological seminary of Mount St. Mary's of the West and built the fine cathedral in Cincinnati. It was not his fault but his misfortune, however, that the finances of the diocese were ill-directed, and when a crisis occurred in 1879, and some $4,000,000 in trust funds were lost, he was broken-hearted but blameless. He resigned his bishopric in 1880, and died on July 4, 1883. W.F.J.

PURDUE UNIVERSITY, an educational institution located at Lafayette, Indiana. It was established in 1869 by the legislature of Indiana, under the terms of the act of Congress of July 2, 1862, relating to the founding of colleges of agriculture and the mechanic arts by the states and territories; and was named in honor of John Purdue, who donated $150,000 and 100 acres of land to the state for the benefit of the institution. It is supported by the state and by the general government. There is also an endowment of $340,000, and other non-productive property, to the value of $900,000. It has 180 acres of land in its campus and farm, and 28 buildings. The university embraces schools of Mechanical Engineering; Civil Engineering; Electrical Engineering; Agriculture; Science; and Pharmacy. In 1907 there were 1,820 students and 125 professors.

PURINTON, Daniel Boardman, an American educator, author and composer; was born in Preston County, Virginia, February 15, 1850. He was educated at the State University of West Virginia, where he received the degree of M.A. in 1876, and became a member of the faculty. His chief work as an educator has been his development of Denison University, Granville, Ohio, and of Shepardson College for ladies, having been made president of both affiliated institutions in 1890. W.R.B.

PURITANS. See Independents, Vol. XII, pp. 761–767.

PURPLE MEDICK or LUCERNE. See Agriculture, Vol. I, p. 335.

PURPLE OF CASSIUS, a purple precipitate obtained by the action of stannous and stannic chlorides on gold chloride. So called because first described by Andreas Cassius of Leyden. Its composition varies according to the method of preparation, so that it contains from twenty to forty per cent of gold along with tin and oxygen. Though the dry powder is often brown or bluish, it gives to glass a beautiful ruby color, and to porcelain violet and red tints, and as the color is permanent, though expensive, it is extensively used in the manufacture of the finer grades of glass and porcelain.

PURPURA. See Mollusca, Vol. XVI, pp. 673, 676.

PURPURINE. Trioxyanthraquinone, a dye which occurs, probably as a glucoside, in madder-root. It is obtained by heating alizarine with manganese dioxide and sulphuric acid, and in other ways. It forms orange-colored crystals containing one molecule of water, and when anhydrous, is dark red, and melts at 253°. It dissolves in water with dark yellow, in alkalis with red color. With alum mordants it gives a fine scarlet color, more yellowish than alizarine, but as it is more expensive than isopurpurine, which gives nearly the same shade, it is not extensively used.

PURÚS, a river of South America; rises in the Gulf of Peru, and flows east-northeast across part of Bolivia into Brazil, and then enters the Amazon, about one hundred miles west-southwest of Manaos. It is a very crooked stream, with numerous side channels, and is very picturesque in parts. From source to mouth its length is about nineteen hundred miles, but in a direct line is only nine hundred miles. Steam-navigation opened in 1869. On its banks is a population of some fifty thousand, engaged in the india-rubber trade.

PUS. See Surgery, Vol. XXII, p. 717.

PUSHKIN. See Poushkin, Alexander, Vol. XIX, pp. 668–669.

PUT-IN-BAY, a village and summer resort on a small island of the Wine Island group, a part of Ottawa County, northwestern Ohio, situated on Lake Erie, 40 miles E. of Toledo. Numerous small islands close together constitute a resort where many people from Toledo, Sandusky, Cleveland and other points spend their summers. The United States ship *Michigan*, the oldest man-of-war in the American navy, and the only one on the lakes, is stationed here most of the time. Commodore Perry gained an important victory over the English near this place, Sept. 10, 1813. Pop. township (1900), 1,040; village, 317.

PUTNAM, Connecticut, a town and city of Windham County, on the Quinebaug River, and a junction of divisions of the New York, New Haven and Hartford railroad, 45 miles east by north of Hartford, and 60 miles southwest of Boston, Mass. It is a busy commercial and industrial center, and a pleasant summer resort in picturesque surroundings; it has fine public buildings and institutions, and its manufactures include woolens, cottons, silk, sheetings, foundry material, machinery, building materials, leather, shoes, lumber, boxes, wood ware and cutlery. Population, 1900, of city, 6,667. C.L.S.

PUTNAM, Frederic Ward, an American archæologist; born in Salem, Mass., April 16, 1839. He graduated at the Lawrence Scientific School, Harvard, in 1862. He has been connected with the Essex Institute, Salem, as curator of ornithology (1856), director of museum (1864), and vice-president (1871–94); with the Boston Society of Natural History, as curator of ichthyology (1859), vice-president (1880–87), and president (1888–89); is professor of American archæology and ethnology at Harvard; curator of the Peabody Museum; advisory curator in the department of anthropology, American Museum of Natural History, New York; chairman of the committee on anthropology at the University of

California; and superintendent of the East Indian Marine Society's Museum. E.E.T.

PUTNAM, George Palmer, publisher, was born at Brunswick, Maine, on February 7, 1814, and after a brief apprenticeship in a carpet house became clerk in a New York bookstore. In 1830 he compiled an *Index to Universal History*, and soon after started the *Booksellers' Advertiser*, the first journal of the book-publishing trade. From 1837 to 1847 he was junior member of the firm of Wiley & Putnam, and in 1848 he founded a house of his own, in New York, which still exists under the name of G. P. Putnam's Sons. It was his fortune to publish the works of Washington Irving and other distinguished writers, and his house soon won a foremost place in the trade. In 1853 he established *Putnam's Monthly*, which for years had the highest rank as a literary magazine. Mr. Putnam was one of the pioneers of copyright reform, one of the founders of the Metropolitan Museum of Art in New York, and the author of several European and other guide books of merit. He died in New York on December 20, 1872.

G. P. PUTNAM.

W.F.J.

PUTNAM, Israel, an American soldier; born in Salem, Mass., Jan. 7, 1718. He was the 11th of a family of 12 children, and as a boy was noted for his strength and bravery. He had little education. At his majority he removed to Pomfret, Conn., where he bought a farm, and here at the age of 25 he had the encounter with a wolf with which his name is so generally associated, and which was a terror to the neighborhood. Its lair in a small cave having been discovered, and dogs having failed to dislodge it, Putnam crawled into the narrow passage and shot it dead. In 1755 he was appointed a captain of militia and did service, under Sir William Johnson, against Crown Point. In 1757 he was commissioned major and received several injuries in saving the powder-magazine at Fort Edward from fire. In 1758 he escaped from an Indian band by running the falls of the Hudson in a bateau, and on another occasion, having been captured by Indians and tied to a tree for roasting, his life was saved through the intervention of a French officer. In 1759 he was raised to lieutenant-colonel and served under Gen. Amherst, and in 1762, commanding a Connecticut regiment, took part in the Havana expedition. In 1764, now colonel, he accompanied Col. Bradstreet to Detroit in the Pontiac war. Afterward he kept a tavern at Brooklyn, Windham County, Conn., and frequently represented that town in the legislature. In 1773 he took part in an exploring expedition on the Mississippi. On the report of the battle of Lexington he left his plough in the furrow and rode the 68 miles to Boston in one day. He then went to Hartford and was elected brigadier-general by the legislature. He organized a regiment and led it to Cambridge, where he was sought out by British officers and offered a major-generalship, which he refused. He distinguished himself at Bunker Hill, and in July, 1775, was commissioned major-general by Congress. He participated in the battle of Long Island, Aug. 27, 1776, and thence proceeded to fortify Philadelphia. Later he commanded in the Highlands of the Hudson, but was removed after the loss of Forts Clinton and Montgomery. In 1779 he commanded in Connecticut and later again in the Highlands, where he completed the fortification of West Point. He died in Brooklyn, Conn., May 19, 1790.

E.E.T.

PUTNAM, Mary Lowell, author, sister of James Russell Lowell, was born in Boston on December 3, 1810, and in 1832 was married to Samuel R. Putnam, a Boston merchant. She translated some works from the Swedish, and wrote many magazine articles. Among her books are a *History of the Constitution of Hungary*, *Records of an Obscure Man*, *The Tragedy of Errors*, and *The Tragedy of Success*, the last two named being dramatic poems, dealing with the subject of human slavery. She died in Boston in 1898. W.F.J.

PUTNAM, Rufus, an American pioneer; born in Sutton, Mass., April 9, 1738. He served in the army until 1760, when he engaged in farming and millwrighting; went on an exploring expedition in Florida in 1773; entered the Continental army, 1775, and rose to the rank of colonel. In 1778 he superintended the fortification of West Point, and in January, 1783, was made brigadier-general. In 1786 he was instrumental in the formation of the Ohio Company, which purchased a large tract of land at the confluence of the Muskingum and the Ohio, and in 1788 he laid out the site of Marietta, Ohio. In 1790 he was appointed judge of the Territory Northwest of the Ohio, and in 1796 became surveyor-general of the United States lands. He died in Marietta, May 1, 1824. E.E.T.

PUVIS DE CHAVANNES, Pierre, painter; was born at Lyons, France, on December 14, 1824, and was a pupil of Henri Scheffer and Theodore Couture. At an early age he devoted himself chiefly to mural and decorative painting, and in that department of art ranked among the foremost masters of his time. He frequently exhibited at the Salon huge works intended for the decoration of public buildings. Among them were *The Return from the Chase* (1859); *Peace*, and *War* (1861); *Toil* and *Repose* (1863); *Autumn* (1864), etc. Many of his works are in churches, public museums, the Hotel de Ville, Paris, and similar places. In 1890 he was one of the leaders of the Society of Artists, which was formed to oppose the Salon in the universal exposition of the Champs de Mars, and, upon the death of Meissonier, became its president. He sent to that exposition a number of notable works, in-

cluding *Between Art and Nature; Ceramic Art; Summer; Winter*, and *The Homage of Paris to Victor Hugo*. He received a second-class medal in 1861, a medal in 1864, a third-class medal at the world's fair of 1867, and the medal of honor at the Salon of 1882. He received the cross of the Legion of Honor in 1882, and was made a commander of it in 1889. His works are characterized by grandeur of conception and marked sobriety of color, and command the highest approval of fine arts connoisseurs. He died on October 25, 1898. W.F.J.

PYGOPODES. See ORNITHOLOGY, Vol. XVIII, p. 49.

PYLE, HOWARD, author and artist, was born at Wilmington, Delaware, on March 5, 1853, and studied art in Philadelphia. In 1876 he settled in New York as an artist, devoting himself chiefly to illustrating books and periodicals. Much of his work has been done for the publications of Harper & Brothers. He has also essayed authorship with success, and has written *Within the Capes*, *Pepper and Salt*, *Otto of the Silver Hand*, *Buccaneers and Marooners of America*, *Jack Ballister's Fortunes*, *The Merrie Adventures of Robin Hood*, *The Rose of Paradise*, *The Wonder Clock*, *Men of Iron*, and *The Garden Behind the Moon*. W.F.J.

PYNCHON, THOMAS RUGGLES, an American clergyman and educator; born in New Haven, Conn., Jan. 14, 1823. He graduated at Trinity College, Hartford, in 1841, and was classical tutor and lecturer on chemistry, 1843–47; Scoville professor of chemistry and natural sciences, 1854–77; professor of moral philosophy, 1877–1902 (now professor emeritus), and president, 1874–83. In this latter capacity he engaged actively in alterations of site and buildings. He was ordained deacon in the Protestant Episcopal Church in 1848; was ordained priest in 1849; and was rector of the churches at Stockbridge and Lenox, Mass., 1849–54. He has been a close student of geology, especially with reference to volcanic action. Died in 1904. E.E.T.

PYNCHON, WILLIAM, colonist and author, was born in England about 1590, and came to America with Winthrop. He settled in Massachusetts, and founded the city of Springfield, which he named for his native place in England. He was the author of several books, controverting the Calvinistic doctrines of the Atonement and of Sabbath observance. For these he was denounced as a heretic, and he thereupon returned to England to avoid persecution. He died in England on October 29, 1662. W.F.J.

PYOGENIC COCCI. See SURGERY, AMERICAN, in these Supplements.

PYRENE, a compound of carbon and hydrogen, having the formula $C^{16}H^{10}$, found in coal-tar. Its constitution is undetermined.

PYRENOMYCETES. See FUNGUS, Vol. IX, p. 733.

PYRHELIOMETER. See THERMOMETER, Vol. XXIII, pp. 311, 312.

PYRIDINE, C^5H^5N, a tertiary base which occurs in fusel-oil and in Dippel's animal-oil, and may be made synthetically in a number of ways. It is a strong-smelling liquid, boils at 116°, forms salts with acids and double salts like ammonia, and also a large number of derivatives. In some Continental countries it and its homologues are added to alcohol used in the arts, and therefore duty free, to render it unfit for drinking.

PYROACETIC SPIRIT, an old name for acetone, which is found in the distillate from wood and is used in making chloroform.

PYROGALLOL, TRIOXYBENZOL OR PYROGALLIC ACID, a phenol obtained by the dry-distillation of gallic acid and in other ways, in thin plates or needles, bitter, poisonous, soluble in water, alcohol and ether, melting at 115° and boiling at 210°. It is an energetic reducing agent, and is used in gas-analysis and photography, in medicine as an ointment, in psoriasis, and with silver nitrate as a hair-dye.

PYROLA, a genus of evergreen herbs belonging to the family *Ericaceæ*, or heaths. The white or greenish-white flowers are borne in a raceme on a scape which bears rounded leaves at base, and usually grow in rich woods. The popular names are wintergreen and shin-leaf.

PYROLIGNEOUS ACID. See TAR, Vol. XXIII, p. 62.

PYROPE. See GARNET, Vol. X, p. 74.

PYROPHORUS, any substance which takes fire on exposure to air. Many metals, such as iron, nickel, etc., in a finely divided state, as obtained by reduction of an oxide at low temperature, are pyrophoric.

PYRO-PHOSPHORIC ACID. See CHEMISTRY, Vol. V, pp. 449–450.

PYROXYLIC SPIRIT. See METHYL ALCOHOL, in these Supplements.

PYROXYLIN. See GUN-COTTON, Vol. XI, p. 245.

QUACKENBOS, GEORGE PAYN, an American educator; born in New York, Sept. 4, 1826. He graduated at Columbia College in 1843, and began teaching in North Carolina. In 1847 he opened a private school in New York, and was principal of the Collegiate School, New York, from 1857 to 1866. At various times he was connected with journalism as contributor or correspondent, and was editor of the *Literary American*, 1848–50. He published, among other works, *Advanced Course of Composition and Rhetoric* (1854); *Illustrated School History of the United States* (1857); and edited *Spiers and Surenne's French Dictionary*, *Bain's Rhetoric*, and *Lockyer's Astronomy*. He died in New London, N. H., July 24, 1881. E.E.T.

QUAIN, SIR RICHARD, a British physician; born in Mallow, Ireland, Oct. 30, 1816; graduated in medicine at the University of London in 1842, receiving a gold medal and a certificate of special proficiency. In 1846 he became a member of the Royal College of Physicians of London, and in 1871 a fellow of the Royal Society. He was also fellow and vice-president of the Royal Medico-Chirurgical and Medical societies of London, and president of the Pathological and Harveian societies. In 1885 he was made physician extraordinary to the Queen; in 1889 received the degree of LL.D. from Edinburgh; and in 1891 was created baronet and elected president of the General Medical Council. In 1882 he edited *A Dictionary of Medicine*, which had a large sale in Great Britain and other countries. He contributed largely to the *Transactions* of learned societies and medical journals. Died in London, March 13, 1898.

QUAKERS. See QUAKERS, Vol. XX, pp. 892–893; and FRIENDS, SOCIETY OF, in these Supplements.

QUAKERTOWN, a borough in Lawrence County, southeastern Pennsylvania, 18 miles S. of Bethlehem, on the Philadelphia and Reading railroad. It contains many manufactories of stoves, musical instruments, agricultural implements, boots and shoes, cigars, carriages and wagons. Population 1890, 2,169; 1900, 3,014.

QUAKING-GRASS, a popular name given to species of the genus *Briza*, notably to *B. maxima*, a European fern sometimes cultivated for ornament. It is a low grass, with broad leaves and drooping, heart-shaped spikelets, which are swollen and purplish, and becoming dry and papery, rattling in the wind, hence often called, also, rattlesnake-grass.

QUANAH, a town and the capital of Hardeman County, northern Texas, on the Fort Worth and Denver City railroad, 175 miles N.W. of Fort Worth. It is in an agricultural and stock-raising district, and has a bank. Population 1890, 1,477; 1900, 1,651.

QUANTITY OR QUANTICS, in mathematics. See MEASUREMENT, Vol. XV, p. 637.

QUARRYING MACHINERY. The channeling process marks the most important improvement in quarrying within recent years. Machines cut straight channels in the rock, so that it is gotten out in large blocks, the side of the quarry being cut in successive steps or shelves, each perhaps six feet in height. Two types of channeling-machine are used, the track-channeler and the bar-channeler. The Wardwell, Sullivan, and Bryant machines are of the first type, and quite similar. The Bryant machine has an upright boiler and engine mounted on a four-wheeled car, and carrying an upright reciprocating drilling mechanism operating a gang of cutters. It has two cushioned arms or levers working on a common fulcrum, so that the drills may be fed down, and the levers dropped without compression of the rubbers. The frame is made of steel I beams, with malleable iron brackets riveted together. By means of friction-clutches the machine can be held on a track with a grade of one to ten.

The diamond channeling-machine differs from other track-channelers in having a toothed rail. This is done in order to move the machine a set distance after cutting each hole. The holes are drilled on the line with diamond bits.

Saunders' track-channeler for side-hill work is a light machine with a drilling mechanism adjustable to any convenient incline. There is no boiler and engine on the car, the power being supplied through a pipe. The chisels are mounted in a gang fast to the piston, so that the blow is delivered directly. On the up-stroke of the piston the car is fed along, and as a result it chips out the channel, instead of powdering it, as do most machines.

The bar-channeler has two heavy tubular bars mounted horizontally on adjustable weighted legs, and bearing on a traveling-saddle a drill with a gang of cutters. It may be used for either horizontal or vertical cutting, and may be

operated either as an ordinary rock-drill or as a channeler.

The cutters used in channeling are a gang of chisel-shaped bits, variously formed according to the nature of the work. A three-drill gang is used for sandstone, and five-drill gangs for harder cutting. A channeler will cut from 150 to 400 square feet of sandstone or limestone in ten hours, and from 75 to 125 feet of marble in the same time.

The gadder or quarry-bar is a rock-drill mounted on a single and usually horizontal bar. When mounted on wheels it is called a gadding-car or gadding-machine. It is used to drill holes in a straight line, and especially in plug-and-feather work. The holes are formed specially for this work, resembling a circle with two V extensions in the direction in which the rock is to split. These holes being drilled vertically and horizontally all about the block which is to be removed, the feathers are inserted the full depth of the holes. Then the plugs are driven in to spread the feathers, and the rock is split along the line of holes.

The latest form of powder-magazine for quarrymen's use has a stone foundation at least two feet high, to guard it from light burnable material, such as leaves that may accumulate at its base. The sides are built very strongly of six-inch timbers, which are bullet-proof, and calculated to preserve the powder from accidents caused by stray sportsmen or stone-throwing boys. The roof is built rather lightly of corrugated iron, so that in case of explosion the drive will be upward, where it can do the least harm. Thawing-houses for dynamite are built very low, and covered and surrounded with broken rock. Bomb-proof shelters are constructed somewhat similarly of strong timbers, the roofs being heaped over with rocks.

Blasting is now done preferably by electricity. The electric fuses are made with a copper shell or cup, about an inch and a quarter in length, and a quarter of an inch in diameter. Copper wires are inserted at the open end, and imbedded in an explosive fulminate that fills two thirds of the shell. The top of the shell is closed by a plug of melted sulphur. The wires are insulated from each other to prevent a current of electricity passing through the fulminate. This fuse is imbedded in the end of a stick of dynamite, and tied to it with twine. A little magneto-machine in a portable case supplies the electricity for the discharge. The wires are connected at its top by binding-screws, and the pushing of a handle does the rest. A row of holes are connected and exploded at one blast.

Engines, boilers, air-compressors, rock-drills, screens, etc., are used commonly in quarrying, but do not require description here. Rock-breakers and conveyors, however, are built in special forms for the quarryman's use. A preferred form of breaker has a stout, upright column bearing at its top a corrugated inverted steel cone, which is made to rotate within a case so shaped that the large stones may enter at the top and be crowded down by gravity against the corrugations, which break the stone until it is small enough to fall through the openings at the base of the cone. Then the broken stone is carried off down an inclined plane. Power is received from a horizontal shaft through bevel-gears. At the foot of the breaker is usually arranged a conveyor of iron buckets mounted on an endless chain, so that the stone can be carried up to the screens, or delivered into cars or wagons by chutes. Small breakers are sometimes mounted on heavy portable trucks, carrying a conveyor at one end. Where the amount of broken stone handled is large, pockets are built, similar to coal-pockets, being stout compartments with space underneath for cars or wagons. From these pockets the stone is let out in chutes as desired.

For hoisting large blocks from the quarry, wire ropeways are common. The tackle includes a combined hoist and traveler, so that the blocks may be raised and then run along the wire to the ground above.

Hydraulic washing is a process recently introduced into the quarrying industry. A powerful steam-pump, and nozzles of five or six inches diameter, similar to those used in hydraulic mining, are used to throw streams of water against a bank, removing the loose dirt and leaving the large stones clear for easy working.

C. H. COCHRANE.

QUARTERMASTER-GENERAL, a staff-officer of the army, with rank of brigadier-general, who is at the head of the quartermaster's department. It is his duty to provide quarters, provisions, and ammunition for the troops, and to furnish means of transportation for troops and the munitions of war. In the British army, he is a staff-officer with rank of major-general or colonel, whose duty it is to prescribe marching routes, execute military surveys, and prepare means for defence, as well as to regulate the transportation of troops and provide quarters for them. R.W.C.

QUARTLEY, ARTHUR, artist, was born in France on May 24, 1839, of English parents, and was taken to England at the age of two years, where he studied art. In 1851 he came to America and became a sign-painter in New York and Baltimore. In 1873 he opened a studio in Baltimore, which he removed to New York in 1875, and devoted himself thereafter to painting landscapes, marine views, and genre works, his highest rank being attained in marine views. He was elected an associate of the National Academy in 1879 and an Academician in 1886. He painted a number of striking views of the harbor and bay of New York, and scenes along the docks. Among his best pictures are *Low Tide*, *Morning on the North River*, *Port of New York*, *Dignity and Impudence*, *The Coast of Cornwall*, *Close of a Stormy Day*, and *From a North River Pier Head*. He died in New York on May 19, 1886.

QUATERNARY ERA. See GEOLOGY, Vol. X, pp. 324–329.

QUATRE-BRAS, BATTLE OF. See NAPOLEON, Vol. XVII, p. 230.

QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE, a French anthropologist; born in Berthezème (Gard), Feb. 10, 1810; studied at Strasburg, where he took the degree of M.D., and began to write on subjects of natural philosophy as early as 1829. In 1838 he was called to the chair of zoölogy at Toulouse, but soon resigned and went to Paris. He was elected professor of natural history in the Lycée Napoléon in 1850, and a member of the Academy of Sciences in 1852; was nominated a chevalier of the Legion of Honor in 1845; called to the chair of anthropology and ethnology in the Museum of Natural History at Paris in 1855; promoted grand officer of the Legion of Honor in 1863, and elected president of the French Geographical Society in 1889. His chief works are *Souvenirs d'un Naturaliste* (1854); *Métamorphose de l'Homme et des Animaux* (1862); *Histoire de l'Homme* (1869); *La Race Prussienne* (1879); *Hommes Fossiles et Hommes Sauvages* (1884); *Histoire Générale des Races Humaines* (2 vols., 1886, 1889). He died Jan. 12, 1892.

QUAY, MATTHEW STANLEY, an American politician; born in Dillsburg, Pa., Sept. 30, 1833. He graduated at Jefferson College, Pa., in 1850. From 1861 to 1865 he was lieutenant in the 10th Pennsylvania Reserves; colonel of the 134th Pennsylvania Volunteers; lieutenant-colonel and assistant commissary-general; military State agent at Washington; private secretary to the governor of Pennsylvania; major and chief of transportation and telegraphs; and military secretary to the governor. He was a member of the legislature, 1865–67; secretary of the Commonwealth, 1872–78, and again 1879–82; a delegate to the Republican national conventions of 1872, 1876, 1880, and 1892; a member of the Republican national committee, 1885–1904, and its chairman in 1888. He was United States senator from March 4 1887, to March 3, 1899, when a deadlock in the legislature prevented his re-election. He was tried for misappropriation of public funds, and was acquitted April 21, 1899; the same day was appointed United States senator *ad interim;* and was elected to the same office in January, 1901, serving till his death, which occurred in Beaver, Pa., May 28, 1904. E.E.T.

M. S. QUAY.

QUEBEC. The province of Quebec, formerly Lower Canada, and for 150 years the seat of French dominion in the New World. (See QUEBEC, Vol. XX, pp. 174–76.) Much of the country is heavily wooded, the hilly ranges—the Laurentides and the Eastern Alleghanies—being clothed with dense forests of conifers and hardwoods, while the valleys abound in cedar, spruce and pine. The scenery is bolder and more picturesque than that of its sister province to the west; and the tourist finds a great source of attraction in the two historic French-speaking cities, Montreal and Quebec, and in the quaint manners and customs of the still mediæval peasant. Besides the cities and towns of the province, there are five distinct centers of colonization, each with large areas for homesteading. These are: 1. The Eastern townships, now French though originally settled by the British, lying between Montreal and the Maine boundary; 2. The valley of the Ottawa; 3. The valley of the St. Maurice; 4. The valley of the Saguenay and the region of Lake St. John; and 5. The Gaspé district, between New Brunswick and the Gulf of the St. Lawrence.

Quebec is rich in minerals of much economic value, though the mines as yet are undeveloped practically. There is the best of building-material in the large quarries of gray and white granite, of which the public buildings of Montreal are constructed; there is also much limestone, slate-stone, plumbago, mica, phosphates, asbestos, and rich veins of copper, nickel and iron-ore. There are also considerable traces of gold, particularly in Beauce County, near the frontiers of the province, and south of Quebec. Another large source of provincial wealth is lumber, which is exported heavily, though not now in square timber, the trade in which used to be monopolized by the city of Quebec and caused its wharves to be thronged with shipping. That halcyon era has passed for the ancient capital, and with it has gone the ship-building industry. What trade there is in lumber has betaken itself, in the main, to Sorel, Three Rivers and Montreal. The fish industries of the province continue to flourish, and there is still a considerable export of furs. At Quebec city tobacco is manufactured largely now, and there are flourishing factories of boots and shoes. Agriculture is a chief occupation of the people, but the export of farm produce is limited, owing to the small holdings of the *habitans* and their primitive methods of farming. Quebec is the one province in the Dominion in which the tobacco-plant is cultivated to any extent. The yield for 1891 was close upon four million pounds.

Montreal, the largest city in the Dominion and the head of ocean navigation, is the chief center of Canadian commerce, and the principal summer shipping-port of Canada. It is the great distributing-point, via the railways and canals, for the entire country, and it has a large and fast-expanding commerce, somewhat handicapped, however, by French inertia. Here are large sugar-refineries, cotton-mills, tobacco factories and other progressive industries which have the benefit of cheap labor. The population of Montreal in 1901 was 267,730; that of Quebec City was 68,840; the population of the province in 1901 was 1,648,898, of which only about 400,000 are English-speaking. The commerce of the province has the facilities of fourteen local banks, with an aggregate capital of close upon $35,000,000, and total assets of $162,000,000. The two chief institutions are the Bank of Montreal, with

a capital of $12,000,000, and the Merchants' Bank of Canada, with a capital of $6,000,000.

The province is governed under a lieutenant-governor, by an executive council of nine members (two of them without portfolios), responsible to the legislative assembly, which has now 74 members. There is also a legislative council of 24 members. To the Dominion Parliament the province sends 65 representatives, and its quota of senators is 24. The net annual revenue in June, 1900, was $4,451,578, and the year's expenditure was $4,433,386.

QUEBEC, "cradle of Canada," with a population of 68,840, celebrated amidst imposing ceremonies, its three hundredth birthday from July 20-27, 1908, having been founded on July 3, 1608, by Samuel de Champlain. The occasion become a memorable one by the presence of the Prince of Wales, Field-Marshal Roberts, Governor-General Earl Gray, Premier of Canada, Lord Laurier and the Vice-President of the United States of America, Mr. Fairbanks. On the 25th of July the Prince of Wales reviewed the international fleet of warships, lying in the harbor and comprising vessels of England, France, Germany and the United States. In the evening of the 25th, a state performance of an elaborate program, depicting the progress of Quebec from the days of Champlain to the battle on the Plains of Abraham, was given in the presence of the Prince. On this historical plain where Wolfe and Montcalm fought out the issues of England and France, 15,000 Canadian troops and 10,000 sailors from the British ships passed before the Prince of Wales.

Most heartily received was Vice-President Fairbanks. His speech, in which he declared to the Prince and the people before Champlain's monument that only good feelings can ever exist between Canada and the United States, has touched a popular chord. The ter-centennial will be commemorated by the erection of a great monument to peace in the harbor and by the establishment of the King Edward Park, which is to encircle the city. The Prince of Wales donated $50,000 to be used in maintaining the Plains of Abraham as a permanent memorial.

QUEEN'S BENCH, COURT OF. Same as KING'S BENCH. See BENCH, Vol. III, p. 480; and RECORDS, Vol. XX, p. 324.

QUEENSLAND, a British Australian colony. The latest reports place the area of Queensland at 668,497 English square miles, with a sea-coast of 2,250 miles. The population in 1900 was 498,549. In the exercise of authority the governor is assisted by an executive council of 9 members. The Parliament has two houses—the Legislative Council of 41 members, and the Legislative Assembly of 72 members. The electoral districts are 61. The number belonging to the various religious denominations was in 1901 as follows. Church of England, 185,023; Church of Rome, 120,663; Presbyterian, 57,615; Wesleyan, 29,791; Lutheran, 25,505; Baptist, 12,252; other sects, 72,417. Education is compulsory. The number of public elementary schools in 1900 was 932, with 2,217 teachers and an average daily attendance of 69,285 pupils. There were also 163 private schools, with 588 teachers and an average attendance of 11,619. The public expenditure for education was (1900) $1,393,290. The revenues of Queensland for the year ending June 30, 1901, were $21,636,725, and the expenditures $24,277,665. The estimated revenue for 1901–02 was $19,542,500, and estimated expenditure $19,439,500. For the defense of the colony there is a drilled force of about 4,000 men, 2,500 militia and several gunvessels ranging from 250 to 450 tons. The live-stock in 1900 numbered 456,788 horses, 4,078,191 cattle, 10,339,185 sheep and 122,187 pigs. The total area under cultivation was 480,372 acres. There were raised 2,684,925 bushels of corn, 545,185 bushels of wheat, and the sugar-cane yielded 91,712 tons of sugar. The amount of coal mined (1900) was 497,132 tons; of gold, 963,189 ounces; of silver, 112,990 ounces; of tin, 1,123 tons; of copper, 384 tons; of lead, 205 tons. The total value of imports in 1900 was $35,920,560, and of exports $47,907,810. The shipping in 1900 consisted of 248 vessels, of an aggregate of 21,083 tons. At the close of 1900 there were 2,801 miles of railways, earning $6,564,280, and expenses $5,174,400. The same year there were 1,277 post-offices, with a revenue of $1,574,200, and 19,308 miles of telegraph, with 472 stations. The number of banks in 1900 was 11, with a circulation of $1,944,165. The savings banks had, on Jan. 1, 1901, 80,900 depositors, with $18,811,030 to their credit.

The question of Australasian Federation has become a realized fact in the government of Queensland. See AUSTRALIAN FEDERATION, in these Supplements. For a general geographical and historical description, see QUEENSLAND, Vol. XX, pp 177–182.

QUEEN'S UNIVERSITY (Kingston, Ontario, Canada), founded in 1841 in the interest of the Presbyterian Church in Canada, in connection with the Church of Scotland. The early development of Queen's was greatly hindered by the separation which took place in the Presbyterian Church in Canada consequent on the disruption of 1844 in Scotland. An improvement in the position of Queen's, however, took place on the reunion of the Presbyterian bodies in Canada in 1874, and as the result of the more effective organization conferred on it by an act of the Ontario legislature of that year. It is now a flourishing institution, having a well-equipped teaching-staff in arts, science and theology, with a medical college in affiliation. Its later career owes much to the enthusiasm of its principal, Dr. George M. Grant.

QUELPAERT. See COREA, Vol. VI, p. 347.

QUERCIA, JACOPO DELLA, sculptor; born near Sienna, Italy, in 1378. His genius was manifested at the age of nineteen in a well-wrought equestrian statue in wood. Two groups in marble in the Cathedral of Sienna rank him among the first artists of his period. In Florence he decorated one of the doors of the cathedral with some noble bas-reliefs, sculptured the ornaments of the doorway of San Petronio at Bologna, and co-operated with Ghiberti in restoring the Sienna cathedral. He died in 1442. G.J.K.

QUERÉTARO, a state of Mexico, inclosed on

the west by Guanajuato and on the east by Hidalgo, in the central southern portion of the country. Its area is 3,556 square miles. It lies entirely in the region of the high plateau, but the surface is mountainous, especially in the northern part; the valleys are fertile, and the higher slopes are covered with pine and oak forests; the climate resembles that of southern California. Its products are maize and cotton, with grain and fruits, and it has mines of silver, lead, copper and iron, with manufactures of woolen cloth, soap, pottery and iron-wares. The capital of the state is Querétaro (q.v., Vol. XX, p. 182), with a population in 1900 of 33,152. Population of the state in 1900, 232,389.

QUESADA, GONZALO DE, diplomatist; born in Havana, Cuba, Dec. 15, 1868. He was brought to the United States by his parents in 1876; was graduated at the College of the City of New York in 1888, and studied law at the University of the City of New York, from which he received the degree of LL.B. in 1891. Later he became secretary to Roque Saenz Peña, minister of foreign affairs for the Argentine Republic, and traveled with this official through England, France, and Spain. He also accompanied him to the Pan-American Congress, held in Washington, D. C. He then went to Philadelphia as consul of the Argentine Republic. He resigned this post to become secretary to the Cuban revolutionary party in the United States. In 1898 he was appointed *chargé d'affaires* of the Republic of Cuba in Washington. Two years later he was special commissioner for Cuba to the United States, and in 1901 was a delegate to the constitutional convention of the young republic, and a member of the committee to frame its constitution. In 1902 he was a member of the Cuban Congress, and in the same year was appointed minister to the United States. He wrote *History of Free Cuba*, etc. G.J.H.

QUICHUA INDIANS. See PERU, Vol. XVIII, p. 689.

QUICKSILVER. See MERCURY, Vol. XVI. 36.

QUILLER-COUCH, ARTHUR T., an English novelist, whose stories appear usually over the initial "Q.," was born at Polperro, Cornwall, Nov. 21, 1863. He was educated in Devonshire and at Clifton College, after which he passed to Trinity College, Oxford, where he graduated a first-class in classics. While at college he contributed to the Oxford *Magazine*, and for a time was classical lecturer at Trinity. He afterward proceeded to London, and was launched on a literary career. With J. M. Barrie, he became a member of the staff of *The Speaker*, in which literary weekly many of his stories and literary criticisms first appeared. His principal publications are *Dead Man's Rock* (1887); *The Astonishing History of Troy Town* (1888); *The Splendid Spur* (1889); *The Warwickshire Avon* (1891); *The Blue Pavilions* (1891); *Noughts and Crosses* (1892); *I Saw Three Ships* (1892); *The Delectable Duchy* (1893); *Green Bays: Verses and Parodies* (1893); *The Golden Pomp: A Procession of English Lyrics from Surrey to Shirley* (1895); *Ia: A Love Story* (1895); *Wandering Heath* (1896); and a series of cleverly-written criticisms, entitled *Adventures in Criticism* (1896).

A. T. QUILLER-COUCH.

QUILLWORTS, the common name of species of the genus *Isoëtes*, a small group of Pteridophytes. They are grass-like plants, with narrow leaves growing in a cluster from short, tuber-like stems, and grow in water or muddy places. The spore-cases are borne upon the leaf-bases within, and are of two kinds, producing large spores (*macrospores*) and small spores (*microspores*). See HETEROSPORY, in these Supplements.

QUILLS. See FEATHERS, Vol. IX, p. 53.

QUILOA OR KILWA. See ZANZIBAR, Vol. XXIV, p. 807; and KILWA, in these Supplements.

QUINCY, a city and the capital of Adams County, Illinois, on the Chicago, Burlington and Quincy, the Hannibal and St. Joseph, the Quincy, Omaha and Kansas City, the St. Louis, Keokuk and North-Western and the Wabash railroads. It has 80 miles of improved streets, 4 public parks, 2 opera-houses, 2 state armories, 2 hospitals, 2 orphan asylums, 9 public schools, 13 parochial schools and a medical and a literary college. Quincy has a very well-organized fire department, and among its finest buildings are the State Soldiers' and Sailors' Home, which has a very fine library, the United States Government Building and the courthouse, surrounded by a handsome park. Its industries in 1900 (421 in number) with a combined capital of $6,879,846, comprise a pork-packing establishment, several stove foundries and machine-shops, carriage and wagon factories, brickyards, cigar and chewing-tobacco factories, flour-mills, cooper-shops, breweries, saddle and harness factories, lime-works, organ factories, paper-mill, furniture factories and steam-governor works; it has also a large public library. Chaddock College (Methodist Episcopal) organized in 1853 and located here, is a co-educational institution, and in 1899 had 14 instructors and 83 students. Pop. 1900, 36,252. See also QUINCY, Vol. XX, p. 189.

QUINCY, a town and seaport in Norfolk County, Massachusetts. Population 1890, 16,723; 1900, 23,899. See QUINCY, Vol. XX, p. 189.

QUINCY, a village of southern Michigan, on the Lake Shore and Michigan Southern railroad, 31 miles S.W. of Jackson. It has two sawmills and manufactories of staves, headings, sash and doors. Population 1890, 1,250; 1900, 1,563.

QUINCY FAMILY, an eminent Massachusetts family, transplanted thither from England in early colonial times and remotely of Norman origin. Two of its best known members, Josiah Quincy and Josiah Quincy, Jr., are dealt with elsewhere in this encyclopædia (see Vol. XX, page 189). Some others may here be briefly mentioned.

QUINCY, EDMUND, colonist, was born in Massachusetts about 1681, and was graduated from Harvard College in 1699. He was a judge and member of the colonial council, and was engaged in the boundary dispute between Massachusetts and New Hampshire. He died in London in 1738.

QUINCY, EDMUND, son of Edmund Quincy, was born in Massachusetts in 1703, was graduated from Harvard College in 1722, was the father-in-law of John Hancock, and died in 1788.

QUINCY, EDMUND, son of Josiah Quincy, was born in Boston on February 1, 1808, was graduated from Harvard College in 1827, wrote a charming novel called *Wensley*, was a prominent abolitionist, and died on May 17, 1877.

QUINCY, JOSIAH, municipal administrator, son of President Josiah Quincy of Harvard College, was born in Boston on January 17, 1802, and was graduated from Harvard in 1821. He became a lawyer, was president of the Boston city council 1834–37, and of the State Senate in 1842. As mayor of Boston in 1845–49 he introduced the Cochituate water system. He died on November 2, 1882. W.F.J.

QUINISEXT COUNCIL. See CANON LAW, Vol. V, p. 16.

QUINOA, the native name of *Chenopodium quinoa*, one of the goosefoots of Central America, and cultivated for its nutritious seeds.

QUINSY. See THROAT DISEASES, Vol. XXIII, p. 341.

QUINTARD, CHARLES TODD, physician and clergyman, was born at Stamford, Conn., on December 22, 1824, and was graduated from the medical college of New York University in 1847. He practiced his profession in Georgia, became professor of physiology and pathology in the Memphis, Tenn., medical college, and was an editor of the *Medical Recorder*. In 1855 he became a minister of the Protestant Episcopal Church, and was a chaplain in the army in the Civil War. In September, 1865, he was elected bishop of the diocese of Tennessee. He reorganized the University of the South and was its first vice-chancellor. He died on February 15, 1898. W.F.J.

QUIRINAL, one of the seven hills of Rome, and the palace. See ROME, Vol. XX, pp. 750–857.

QUIRITES. See ROMAN LAW, Vol. XX, p. 686.

QUITCLAIM, a form of release by deed in use in the United States. The character of this deed is similar to that of the release in English law. See RELEASE, in these Supplements.

QUITMAN, a village and the capital of Brooks County, southern Georgia, 14 miles E. of Valdosta, on the Savannah, Florida and Western railroad, and on the Ocopilco River. It has an academy, six churches and three newspapers. Population 1890, 1,868; 1900, 2,281.

QUITMAN, JOHN ANTHONY, an American politician and soldier; born in Rhinebeck, N. Y., Sept. 1, 1799. He became a tutor at Hartwick Academy, Cooperstown, N. Y., in 1815; professor of English literature at Mt. Airy College, Germantown, Pa., in 1817; and began the study of law at Chillicothe, Ohio, in 1818. Later he removed to Delaware, Ohio, where he was admitted to the bar. In 1821 he settled in Natchez, Miss., and practised his profession. He was a member of the State House of Representatives in 1827, and State chancellor from 1828 to 1834, when he was elected to the State Senate and was chosen its president. He filled a temporary vacancy in the governorship in 1836, but soon afterward led a small body of men to the assistance of the Texans, then struggling for independence. He then resigned his practice in Natchez, and held various local positions of honor till 1846, when he was appointed brigadier-general, U. S. A., and ordered to Mexico. He distinguished himself at Monterey, Vera Cruz, Pueblo, Chapultepec, and the city of Mexico, and was brevetted major-general for gallantry and received a sword from Congress. He was next elected governor of Mississippi, but, owing to a conflict with the federal government in regard to an alleged Cuban filibustering expedition, resigned the office, for which, however, he was renominated, but he withdrew from the campaign. He sat in Congress as a Representative from Mississippi from Dec. 1, 1855, until he died at "Monmouth," his plantation in Mississippi, July 17, 1858. E.E.T.

QUORUM, as applied to deliberative or other organized bodies, means the number of members in a meeting whose presence is necessary to make the proceedings legal. If no specific rule as to the number required has been adopted by the body, a majority of the members is regarded as a quorum. But less than a majority may, by a rule, be made a quorum; the British House of Commons requiring forty members, the United States House of Representatives a majority of all the members, the New York Senate the presence of three fifths of the members. Because of its great importance in legislation the question as to what constitutes a quorum recently assumed in the United States great interest. Each house of Congress makes its own rules of order, which must be in harmony with the constitution. The constitution provides that "a majority of each house shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members." In view of this clause of the constitution, the Thirty-seventh Congress, to which several states had failed to send representatives, decided that a majority of the members chosen constituted a quorum to do business. In the Fifty-first Congress (1889–91), the point of order was raised that no quorum had voted on a certain question under consideration, 161 yeas and 1 nay having been announced by the speaker, or 162 votes—less than a majority. Thereupon the speaker (Thomas B. Reed) directed the clerk to enter upon the journal the names of certain members as "present and refusing to vote," and ruled that a quorum was present within the meaning of the constitution. The grounds for this ruling, as stated at the time by the speaker, were substantially these: That certain members who did not vote when their names were called

were bodily present; that the speaker of the Senate of New York had decided in 1883, in a similar case, that its constitutional provision as to a quorum was entirely satisfied by the presence of the members, even if they did not vote; that in a similar case in the legislature of Tennessee in 1885 the speaker directed the clerk to count as present those there but not voting, and a quorum thus being present, he declared the bill under consideration passed; that it has always been the practice in the Parliament of Great Britain for the speaker to determine by count whether or not a quorum is present; that the constitution of the United States has a provision for compelling the attendance of absent members in order to obtain a quorum. If members can be present and not be counted as a quorum, that provision is nugatory; and inasmuch as the constitution provides for the attendance of members, attendance only is enough, otherwise the constitution would have provided for more.

The following extracts from the ninth edition of *Cushing's Law and Practice of Legislative Assemblies* on the subject of quorum are here given in further explanation of the subject:

"In all councils and other collective bodies of the same kind, it is necessary that a certain specified number, called a quorum, of the members, should meet and be present in order to the transaction of business. This number may be fixed precisely in the first instance, or some proportional part established, leaving the particular number afterward to be ascertained, with reference to each assembly, and this may be done either by usage or by positive regulation; and, if not so determined, it is supposed that a majority of the members composing the body constitute a quorum. . . . . In the United States the number necessary to constitute a quorum, in all the states respectively, and in the Congress of the United States, is regulated by constitutional provision. When the number of which an assembly may consist at any given time is fixed by constitution, and an aliquot proportion of such assembly is required in order to constitute a quorum, the number of which such assembly may consist and the number of which it does in fact consist at the time in question, is the number of the assembly, and the number necessary to constitute a quorum is to be reckoned accordingly. Thus, in the Senate of the United States, to which, by the constitution, each state in the Union may elect two members, ... the quorum is a majority of that number, whether all the states have exercised their constitutional right or not. So, in the second branch of Congress . . . . the quorum is a majority of the whole number, including the number to which new states may be entitled, whether they have elected members or not, and making no deductions on account of vacant districts."

The courts of many of the states, as well as their legislatures, have taken the same course in regard to the subject of a quorum as did the House of the Fifty-first Congress, which may best be stated in the language of the speaker, as follows:

"We must, therefore, in this House at least, consider the question settled, that if a majority are present to do business, their presence is all that is required in order to make a quorum. If they decline to vote, their inaction cannot be in the pathway of the action of those who do their duty. The idea that silence can be stronger than a negative vote seems to have been unknown to our ancestors. It seems to be a modern parliamentary fiction which has never been able to stand the examination of courts where business questions were involved. I have yet to see a single decision of a court against the position which has lately been taken by the House of Representatives."

QUO WARRANTO. One of its chief uses in the United States is to question the authority of a corporation to continue its operations as such. Throughout the United States the law generally provides that the attorney-general of the state may file the information against a corporation, and in such case he has the exclusive right to do so. He may act without leave of court. Such proceedings frequently are instituted against state, city, county and other public officers who assume official functions without proper authority. The judgment, in case the writ is sustained against an officer or individual, is ouster; against a corporation by its corporate name, it is ouster and dissolution. For a definition of the term and the uses of the proceeding in British law, see QUO WARRANTO, Vol. XX. p. 106.

R

RA—RADIATORS FOR INDOOR HEATING

RA, The Sun God. See Egypt, Vol. VII, p. 619.

RAASAY, a sound and one of the Western isles. The isle belongs to the group of the Inner Hebrides, and lies between the Isle of Skye and the mainland; the Sound of Raasay separating it from the former, and Applecross Sound from the latter. It is 13 miles in length by two and a half miles in greatest breadth. Population, 389. See Hebrides, Vol. XI, p. 542.

RABANUS, Maurus Magnentius. See Hrabanus, Maurus, Vol. XII, p. 339.

RABBINICAL LITERATURE. See Mishnah, Vol. XVI, pp. 526–531; also Talmud, Vol. XXIII, pp. 40–44.

RABBIS. See Judaism in the United States, in these Supplements.

RABBULA. See Syriac Literature, Vol. XXII, p. 869.

RACALMUTO, Italy, a hill town in the province of Girgenti, Sicily, 14 miles by rail northeast of Girgenti and Porto Empodocle on the south coast. It has mining industries, exporting sulphur, rock salt and mercury. Racalmuto was founded by the Saracens, and has a 14th century castle. Population, 15,187. C.L.S.

RACAN, Honorat de Bueil, Marquis de (1589–1670). See France, Vol. IX, p. 577.

RACCAHOUT, des Arabes, food prepared from the starch of the acorns of *Quercus ilex* and *Q. ballota*, oaks growing in Barbary. It is prepared as a sweetmeat or for use as a beverage by admixture with chocolate, vanilla, etc.

RACE, Cape, the most noted cape of the island of Newfoundland, lying near the southeast corner of the island, near the track of the principal transatlantic steamship lines. It has been the scene of many disasters to shipping, and is now surmounted with a powerful revolving beacon light, provided by the British government, and maintained by a tax upon the shipping of Newfoundland. W.F.J.

RACEMIC ACID. See Tartaric Acid, Vol. XXIII, p. 75.

RACHEL. See Jacob, Vol. XIII, p. 545.

RACINE, an important city and the county seat of Racine County, Wisconsin, in the southeastern part of the state. It lies on the shore of Lake Michigan, twenty-five miles south of Milwaukee, and is reached by the Chicago and Northwestern and the Chicago, Milwaukee and St. Paul railroads. It is the seat of Racine College, an institution of the Protestant Episcopal Church, founded in 1852, and several other educational concerns of high rank, and is well provided with public libraries, hospitals, asylums, and other urban equipments. It is a favorite place of residence, and has considerable commerce by both lake and railroad. Its population in 1900 was 29,102. See also in Vol. XX, p. 210. W.F.J.

RACINE, Louis, author; born in Paris, France, in 1692, son of Jean B. Racine. His fame rests principally on the poems *Religion* and *Grace*. He also published *Memoirs of the Life of Racine*, etc. He died in 1763. G.J.H.

RACING, horse-racing. See Horse, Vol. XII, pp. 203–210, 212; also Horse-Racing and Trotting and Pacing, in these Supplements.

RACK, of a quadruped, the method of progressive motion, in which the two feet of one side are placed upon and lifted from the ground at nearly the same moment, alternating with the two feet of the other side. In the trot, the front and hind foot of opposite sides are moved nearly synchronously; in the rack, the feet of the same side.

RACK, in mechanics. See Mechanics, Vol. XV, p. 764; in torture, see Torture, Vol. XXIII, p. 495

RACK, an intoxicating liquor. See Arrack, Vol. II, p. 549; Cocoanut Palm, Vol. VI, p. 94; and Distillation, Vol. VII, p. 230.

RADCLIFFE COLLEGE, an institution of learning, admitting women students only, located at Cambridge, Mass. It originated in 1879 in an arrangement whereby women might receive instruction from members of the Harvard University faculty. Up to 1881 the work was carried on by a board of managers, but in that year a corporation was formed, with the title, The Society for the Collegiate Instruction of Women, which became known as the Harvard Annex. In 1894 the society took the name of Radcliffe College, in honor of Anne Radcliffe, the founder of the first Harvard scholarship, and a closer relation was established between the institution and Harvard. Its degrees bear the Harvard University seal. R.W.C

RADIATORS FOR INDOOR HEATING. Radiators for heating by means of steam or hot air are made in the form of hollow vessels or coils of pipe. The latter form is most common, and is varied in arrangement and appearance principally to secure ornamental effects, that the radiator may present a sightly addition to the furnishings of an apartment. Heating by low-pressure steam necessitates a boiler partially filled with water, the maintenance of a water-line and radiators or coils at a proper distance above this line, and equal pressure on all parts of the system, with provision for relieving all radiators and supply-pipes from condensation and returning it automatically to the boiler. Latent heat is absorbed while the water is being converted into steam, which is obtained only while the water is held under a pressure above the atmosphere (unless steam is condensed by mechanical attachments). To utilize this latent heat for warming the air in a room, the steam is condensed by

contact of air with the outside surface of the radiator, and the water thus obtained is returned to the boiler. The system of piping for this method varies with the requirements of different buildings and apparatus. Direct, indirect, or direct-indirect radiators are used, or a combination of all, according to the requirements of ventilation, etc. A direct radiating surface consists of radiators or coils placed in the rooms to be warmed without a supply of fresh air. The heat is absorbed by the air in contact with the radiator, causing it to expand, rise, and become displaced by the heavier, cooler air, which in turn is warmed. An indirect system of heating is effected when the radiators or coils of pipe are placed in the basement or some lower room, and inclosed in chambers, usually boxes lined with tin. Outside air is conveyed to the chambers through ducts, and becoming heated, ascends to the desired points. A direct-indirect radiating surface consists of direct radiators with closed base, outside air being conveyed through a duct to the heating surface, where it is heated and discharged into the room.

C. H. COCHRANE.

RADICAL AXIS. See CURVE, Vol. VI, p. 634.

RADICLES. See CHEMISTRY, Vol. V, pp. 403, 478.

RADIOLARIA. See PROTOZOA, Vol. XIX, p. 872.

RADIOMETER. See PNEUMATICS, Vol. XIX, p. 261.

RADIOPHONE. See TELEPHONE, Vol. XXIII, pp. 140–145.

RADISH, vegetable. See HORTICULTURE, Vol. XII, p. 299.

RADIUM. A substance, discovered by M. and Mme. Curie, of France, in 1898, having marvelous physical and chemical properties. It has the power of giving out light perpetually without any apparent exciting cause, of emitting rays that penetrate solids, of acting on sensitized plates, of making air an electric conductor, and of radiating heat. Radium does not exist in nature as a pure or distinct metal, but is extracted from a mineral called pitchblende and tons of minerals have to be subjected to laborious processes in the chemical laboratory to obtain a few grammes of the material. Its great rarity and astounding potency make it exceedingly precious.

RADIUS. See ANATOMY, Vol. I, p. 725.

DR. JOHN RAE.

RAE, JOHN, explorer; born in the Orkney Islands in 1813; began the study of medicine in Edinburgh in 1829, and received his degree in 1833. Shortly after he was appointed surgeon to a ship of the Hudson Bay Company. In 1845 he took command of an expedition to the Arctic seas for the purpose of surveying about 700 miles of coast which formed the shores of a large bay, and was successful in the venture. In 1849–50 he commanded an expedition to search for Sir John Franklin. He first traveled 1,100 miles along the shore of Wollaston Land, and then explored the east shore of the Coppermine River for 300 miles. He next searched Victoria Land and Victoria Strait. Thence he journeyed 1,350 miles to what is now the city of Winnipeg, Manitoba, and finally made a trip of 1,100 miles, of which 400 miles had never before been explored. He secured relics and facts of Franklin's fate. Returning home he received $50,000 as a reward for the first information furnished as to the fate of Franklin. He also, in recognition of his explorations, received the Founder's Gold Medal of the Royal Geographical Society. He died in London, England, Jan. 24, 1893. G. J. H

RAFFLESIA. See PARASITISM, Vol. XVIII, p. 269.

RAFINESQUE, CONSTANTINE SCHMALTZ, a botanist and traveler; was born at Galata, a suburb of Constantinople, in 1784, his father being a French merchant in the Levant. He visited the U. S. in 1802 and made many botanical collections. From 1805 to 1815, he lived in Leghorn and Sicily, and published there *The Flora and Natural History of Sicily; Sicilian Ichthyology* (1810); *Sicilian Crustaceoüs Animals* (1814). He returned to America in 1815, and in 1818 was made professor of botany at Transylvania University at Lexington, Ky. In 1830 he settled in Philadelphia. He wrote *Annals of Kentucky* (1824); *The American Florist* (1832); *The American Nations* (1836); *Medical Flora of the United States* (1828); *A Life of Travel and Researches* (1836), and *The Genius and Spirit of Hebrew Poetry* (1838). Many of his manuscripts are in the National Museum at Washington. Died in Philadelphia, Sept. 18, 1842. *Revised by* R. W. C.

RAGNAROK. See ÆSIR, Vol. I, p. 189.

RAGONA, DOMENICO, an Italian astronomer and meteorologist; born in Palermo, Sicily, Jan. 20, 1820. While still young he was appointed assistant professor of physics at the University of Palermo. In 1851 he was sent to Germany, at the expense of the government, to perfect his knowledge of astronomy. He studied in Berlin under Encke, and in Bonn under Argelander, and was esteemed greatly by Humboldt. On his return he was appointed director of the Observatory of Palermo and professor of astronomy. In 1860 he was transferred to the Observatory of Modena, Italy. In 1870 he established a network of meteorological field-stations in the province of Modena, the first in Italy. The results of his work in astronomical science have been published in the *Transactions* of the Berlin Observatory, the *Bulletin International*, the *Astro-Meteorological Journal*, *Memoirs of the Society of Natural Sciences*, and other journals. He published numerous papers and dissertations on meteorology, invented many new instruments, and founded the Italian Meteorological Society, presiding over it for the first three years. He was counted among the most illustrious of meteorologists.

RAGUET, CONDY, merchant and political economist, was born in Philadelphia on January 28, 1784, was educated at the University of Pennsylvania, and became a lawyer. He turned from

that profession into mercantile life, in which he was highly successful. In 1815 he entered the Pennsylvania legislature, and in 1822 was made consul at Rio Janeiro, in which capacity he negotiated a commercial treaty with Brazil, and he was then made *chargé d'affaires*. After five years in Brazil he returned to the United States, and became the editor of several journals devoted chiefly to free trade principles.. He was the author of *Principles of Free Trade*, *On Currency and Banking*, and *A Short Account of the Present State of Affairs in Santo Domingo*. He died on March 22, 1842. W. F. J.

*RAILROADS IN THE UNITED STATES. Transportation by rail has become interwoven with all the great industries of the nation. The Baltimore and Ohio railroad, the first railroad undertaken in the United States having for its object the transportation of passengers and freight, was opened from Baltimore to Ellicott's Mills, a distance of 14 miles, on May 24, 1830. The whole main stem, from Baltimore, Maryland, to Wheeling, 380 miles, was not opened, however, until Jan. 1, 1853.

Following the Baltimore and Ohio, the next important line to be undertaken was the Charleston and Hamburg railroad (afterward the South Carolina, and now [1896] the South Carolina and Georgia), extending from Charleston, South Carolina, to Hamburg, on the western line of the state, opposite Augusta, Georgia. The length of this line is 137 miles. Its construction was begun in 1830 and the whole line was completed and opened for business Oct. 1, 1833, being at that time the longest continuous line of railway in the world. Upon this line the first locomotive built in the United States was run. It was called "The Best Friend of Charleston," and was built at the West Point foundry in Cold Spring, Putnam County, New York. It arrived in Charleston, Oct. 23, 1830, and was placed on the road for an experimental trip, Nov. 2, 1830. On the 15th of January, 1831, the anniversary of the commencement of the construction of the railroad, this engine made its first regular trip.

Although this was the first locomotive to be built in the United States, it was the second to be put into use, the Delaware and Hudson Canal Company having, in 1829, imported the "Stourbridge Lion," an engine constructed by Foster, Rastrick and Company of Stourbridge, England, for use on its Carbondale and Honesdale railroad. The experimental trip of this engine was made Aug. 8, 1829, in charge of Horatio Allen, that being the first and only time that that distinguished engineer ran a locomotive-engine. The "Stourbridge Lion" was found too heavy for the track it was employed upon, and its use was discontinued after a short time.

*Copyright, 1897, by The Werner Company.

The first railroads seem not to have been very remunerative. They were rude structures compared with the roads of the present day; nevertheless, the people continued to build them, and at the close of 1835 about eleven hundred miles of road had been completed. From this period to 1837 vast railroad projects were entered upon, but, owing to the general financial depression, comparatively little was accomplished till about the time of the acquisition of California.

In 1840 there was a well-defined system of railroads in New England, which has Boston for a center. The Eastern railroad was in operation from Boston to Portsmouth; the Boston and Lowell and the Lowell and Nashua formed a continuous line from Boston to Nashua; the Boston and Providence was completed to Providence, and the New York, Providence and Boston continued that line from Providence to Stonington. Of the present Boston and Albany line, three sections were then completed; from Boston to Worcester, 44.63 miles, built by the Boston and Worcester Railroad Company; from Worcester to Springfield, 62.60 miles, built under the charter of the Western Railroad Company; and from Hudson, New York, to Pittsfield, Massachusetts, 46.51 miles,—making a total of 153.74 miles. The last-mentioned section was composed of a portion of the western division of the Western railroad, from the New York state line to Pittsfield, Massachusetts; the remaining portion, all in the state of New York, was built by what was known as the Hudson and Berkshire Railroad Company. This left a gap between Pittsfield and Springfield on the Western railroad, which was completed in 1841, and the whole line opened throughout in September of that year.

In 1840 the Boston and Maine railroad was being operated from Wilmington to Exeter, and the Boston and Lowell tracks were used to gain entrance to Boston. The Norwich and Worcester was in operation between Worcester, Massachusetts, and Norwich, Connecticut, and the New Haven and Hartford was completed between the two points named in its title.

The following statement shows the mileage of railroad in the United States at the end of 1840, in operation and nearing completion:

STATES AND TERRITORIES.	MILES OF RAILROAD.
Maine	14.50
New Hampshire	37.30
Massachusetts	305.99
Rhode Island	43.40
Connecticut	94.50
Total New England states	495.69
New York	373.44
New Jersey	197.05
Pennsylvania	635.35
Delaware	39.19
Maryland	204.36
Total Middle states	1,449.39
Ohio	38.00
Michigan	118.90
Total Western states	156.90

States and Territories.	Miles of Railroad.
Virginia	301.71
North Carolina	92.10
Kentucky	29.00
South Carolina	204 00
Georgia	275.00
Alabama	46.00
Total Southern states	947.81
RECAPITULATION.	
New England states	495.69
Middle states	1,449.39
Western states	156.90
Southern states	946 81
Total United States	3,048.79

The great movement in the construction of railways, however, dates from the discovery of gold in California. The effect upon the industries and commerce of the country, of the sudden addition of more than $50,000,000 annually to its circulating medium, was prodigious. For the increased wealth and newly-created enterprise of the nation, the railway offered the most attractive and appropriate field. From 1849 to 1857, 17,138 miles of railway were constructed. Then came a great commercial revulsion, which, commencing in the United States, swept round the world. But the nation had grown too strong to suffer anything more than a temporary check. The lines of railroad which had been constructed penetrated every important portion of the country, and gave a high commercial value to all its products. Labor everywhere was thus enabled to reap, even in the midst of the great depression that prevailed, a remunerative return.

In 1848 a continuous line of railway was formed between Boston and New York City by the completion of the New York and New Haven railroad, its formal opening occurring on the first day of January, 1849.

In 1851 the Erie was opened from the Hudson to Lake Erie. Soon after the opening of the Central line, in addition to the ordinary charges for transportation, canal tolls were imposed upon all freight passing over it, to prevent the diversion of traffic from the canal, the railroad and canal being parallel for their whole length. In 1851 the Central line was relieved from the canal tolls, on the ground that it should be placed on as favorable footing as the Erie, which by its charter was exempted from them. In 1851 the Hudson River railroad was opened, and with it two lines of railroad from the harbor of New York to the lakes, neither of them being subject to any other burden than the cost of transportation. The total through tonnage of the only roads that could then compete with the canals—the Baltimore and Ohio not being opened until 1853, nor the Pennsylvania till 1854—was 78,134 tons; the through west tonnage of the two roads for the year was 46,601 tons, against a through tonnage on the canal from the Western states of 1,151,978 tons, or, including that from Buffalo of fully 1,300,000 tons, a total of about 2,450,000 tons; in other words, a quantity twenty-six times greater than that of the two railroads competing for its business.

In 1852 the Michigan Central and Michigan Southern roads were completed to Chicago. Since and including the year 1849, the average annual increase of railroads in the United States had been 1,728 miles. Up to 1849, the average annual increase in miles of road was 316.

From 1861 to 1864 railroad construction was virtually suspended, the total additions during that time being only 3,273 miles, of which 133 miles were in New England, 1,235 in the Middle states, 1,433 in the Western states, 143 in the Pacific states and 329 in the Southern states. In 1840 the rates of mileage of railroads to population was one mile of road to every 7,415 inhabitants; in 1850 it was one mile to every 3,298; in 1860 one mile to 1,083. In the gold-producing states the railroad system was slow to start its development. Till 1855 there were no railroads in the Pacific states. During eight years more there were less than thirty miles, and the cost of transportation was enormous.

From 1865 until 1873 the construction of new lines of railroad progressed with unusual vigor, due in a measure to the great abundance of capital, but primarily to the undertaking of the Pacific lines of railroad under the stimulus of government aid. In this period no less than 36,359 miles were added to the country's railway ramifications, being an increase of nearly 107 per cent. In other words, more railroads were built in these nine years than in the preceding 34 years.

The financial disasters of 1873 were followed by a long period of depression in all the industries of the country. Though in none was it more marked than in that of railway extension, yet such were the requirements of the country that in the five years, 1874 to 1879, there were added 16,316 miles of road, an annual average of 3,263 miles, against an average of 4,040 miles per annum during the nine years preceding.

In the following statement the progress of railroads in the two periods above referred to is clearly set forth:

States.	1864.	1873.	Incr'se 1873.	1879.	Incr'se 1879.
New England states	3,793	5,314	1,521	5,903	589
Middle states	7,580	13,028	5,448	14,985	1,957
Central Northern states	10,570	20,174	9,604	24,004	3,830
South Atlantic states	5,519	7,474	1,955	8,215	741
Gulf and Mississippi states	3,865	6,118	2,253	6,812	694
Southwestern states	1,454	8,114	6,660	11,843	3,729
Northwestern states	962	7,519	6,557	10,414	2,895
Pacific states	166	2,527	2,361	4,408	1,881
Total United States	33,909	70,268	36,359	86,584	16,316

From 1874 to 1888 there were built 85,901 miles of new railroad, an increase of over 122 per cent; that is, in these fifteen years there were built 15,633 miles of railroad more than were built in the preceding forty-five years. The first five of these fifteen comprised a period of depression, the next four years were years of unexampled activity, while the three years of 1883, 1884 and 1885 were years of hesitancy, in which

no new railroad enterprise of great magnitude was begun, as was natural, after the completion in a single year (1882) of nearly 11,600 miles of road. In 1886 there were added 8,018 miles and in 1887 12,878 miles, the latter surpassing the record of any previous year; and in 1888 6,912 miles. In the three years the new construction aggregated 27,808 miles, or within 351 miles of the extraordinary record of the three years from 1881 to 1883. In these two periods (1881–1883 and 1886–1888), covering only six years of national existence, 56,000 miles of railroad, being more than 30 per cent of the total in operation in 1895, was built at a cost, meaning a permanent investment, of $1,750,000,000.

Since 1888 there has been a steady decline in railway construction, as shown in the appended tables, embracing all the United States.

Years.	Miles New Railroad Built.	Total Railroad Mileage.
1881	9,778.85	103,143.00
1882	11,599.52	114,712.00
1883	6,818.72	121,455.00
1884	3,973.71	125,378.51
1885	3,131.14	128,360.78
1886	8,128.48	136,400.51
1887	12,983.62	149,256.76
1888	7,066.00	156,169.13
1889	5,695.67	161,352.82
1890	5,656.70	166 690.56
1891	4,620.41	170,762.43
1892	4,584.01	175,181.06
1893	2,789.02	177,457.96
1894	2,157.39	179,279.34
1906	---------	222,635.00

Pacific Railroads. The completion of the Union Pacific Railroad on the 8th of May, 1869, and the opening of the first through transcontinental route formed thereby, has been deservedly classed as among the most potent factors in the extraordinary growth of the great West, as well as one of the strongest ties which has bound the rapidly growing communities of the Pacific slope with the people east of the Mississippi River.

Important as was this event, it was overshadowed by the completion, in 1883, of three other transcontinental routes in different sections of the country. While the year was yet in its infancy, the Southern Pacific and the Galveston, Harrisburg and San Antonio Railroads formed a junction at El Paso, Texas, and established a route running westwardly and northwestwardly from New Orleans through the states of Louisiana, Texas, New Mexico, Arizona and California to San Francisco.

The opening of the Northern Pacific railroad attracted widespread attention, not only on account of the elaboration of details attending it, but for being the completion of a stupendous enterprise. Chartered in 1864, it was not until 1869, when the Union Pacific had been completed, that construction was actually begun. In 1873 there were completed on the eastern end 450 miles of road from Duluth, Minnesota, west to Bismarck, Dakota, and on the western end 105 miles from New Tacoma, Washington, to Kalama. The financial disasters of that year were more than the enterprise at that stage of its existence could withstand. It was sold, and reorganized; and when the financial storm had spent its force, in 1879, the Northern Pacific Railroad Company began anew the work of construction on the west bank of the Missouri River, opposite Bismarck; and several months later, on the western division of the line at the confluence of the Columbia and Snake rivers, in Washington Territory. The intervening gap between those points was 1,222 miles; and until complete success was achieved by the driving of the golden spike, on Sept. 8, 1883, the work progressed without serious interruption.

Following closely on the opening of the Northern Pacific came the announcement of the completion of the western division of the Atlantic and Pacific railroad to the Needles, on the Colorado River, where connection is made with the Southern Pacific railroad of California, and forming, in connection with that line and the Atchison, Topeka and Santa Fé, with which connection is made at Albuquerque, New Mexico, the fourth transcontinental route.

Besides these lines the other important extensions in the section of the country west of the Mississippi and east of the Rocky Mountains were by the St. Paul, Minneapolis and Manitoba, now the Great Northern system, which extended its line westward to Helena. The Chicago and North-Western was equally active in forwarding its western extension to Fort Casper, Wyoming, the Burlington in extending its line to Denver and more recently in a northwesterly direction to Merino, Wyoming, and the St. Paul in securing a line to Kansas City. All of these lines added considerably to their mileage in the way of branches, etc., and a vast number of important independent lines were also constructed. But the chief event of the period in that section of the country was the great battle of the powerful railroad corporations for territorial control. In the great struggle that ensued from the rivalry of the Atchison, Missouri Pacific, Rock Island, the Burlington and the Union Pacific companies, a far greater extent of mileage was added than under ordinary circumstances would have been constructed in a quarter of a century.

Rails. The pattern of rail now in general use was designed by Mr. Robert L. Stevens, who was actively identified with the construction of the Camden and Amboy railroad in New Jersey, upon which line rails of this style were first laid. These rails were made in England, there being at that time no rolling-mill in the United States capable of manufacturing them.

"The rails," says a historian of that road, "are of rolled iron, 16 feet long, 2⅛ inches wide on the top, 3¼ inches at the bottom and 3½ inches deep; the neck ½ inch thick. The weight is 209 pounds, equal to 39$\frac{3}{16}$ pounds per yard. They are secured by clamps of iron, riveted at the extremity of each bar. The rails are attached to the stone blocks and sleepers by means of nails or pins at the sides, driven into wooden plugs. Chairs are dispensed with." The use of the H or T rail spread rapidly

to all the chief roads of the United States. It became widely known as the Vignoles rather than the Stevens rail, because a European engineer; Mr. C. B. Vignoles, hastened its introduction on European railways, using them on English roads during the progress of construction to an extent that gave to them the title of contractors' rails.

In 1863 the first steel rail was laid in the tracks of an American railroad. Steel rails were then in use in Great Britain, to a very limited extent, however, but so enthusiastic in their praises were the railroad managers who had tried them that the Pennsylvania Railroad Company was induced to order a small lot with which to make experiments, and accordingly purchased one hundred tons of English steel rails, paying $150 gold per ton, equivalent at that time to over $300 in United States currency. These rails were made of crucible steel, and proved to contain such a large percentage of carbon that many of them broke during the following winter, which was unusually severe. The company was not discouraged by this unfortunate experience, but gave further orders for 500,000 ton lots, which were presumably made of softer metal. In 1864 imported steel rails sold at $162.50 gold per ton, or about $250 per ton currency, but later in the year they sold at $135 gold. The Bessemer process of steel production was then in its infancy.

On May 24, 1865, the first Bessemer steel rail made in the United States was rolled by the North Chicago Rolling-Mill Company from steel made at Wyandotte, Michigan, this being an experimental rolling of but six rails. In 1867 some tons were also rolled in an experimental way by the Spuyten Duyvil (New York) Rolling-Mill from steel made at Troy, New York. In August, 1867, the Cambria Iron Company began to roll Bessemer steel rails in the way of regular business. Other companies soon followed in their wake, and from 1870 the Bessemer steel-rail manufacture assumed in the United States the position of an established branch of the iron and steel trades.

The following statement showing the mileage of iron rails and of steel rails in the total track-mileage of the United States is taken from Poor's Manual for 1901:

Year.	Miles Steel Rails.	Miles Iron Rails.	Total Miles.	Per Cent Steel of Total.
1881	49,063	81,473	130,536	37.5
1882	66,691	74,269	140,960	47.3
1883	78,491	70,692	149,183	52.7
1884	90,243	66,254	156,497	57.6
1885	98,102	62,495	160,597	61.0
1886	105,724	62,324	168,048	62.9
1887	125,459	59,588	185,047	67.7
1888	138,516	52,981	191,497	72.3
1889	151,723	50,513	202,236	75.0
1890	167,606	40,697	208,303	80.4
1891	174,931	39,756	214,687	81.5
1892	182,858	38,641	221,499	82.6
1893	191,857	37,155	229,012	83.8
1894	197,653	35,266	232,919	84.8
1895	206,546	28,652	235,198	87.8
1900	239,629	18,224	257,853	92.4

Locomotives. A great advance in railway traffic came from the introduction of Bessemer steel rails. It rendered possible an increased weight of locomotives and higher rate of speed, resulting in an enormous increase in the carrying capacity per train of the railroads and in more prompt and efficient service both for passenger and freight traffic. Nothing can be more striking than to contrast the present engine with that of 1826. The locomotives first constructed weighed only from three to six tons, and were hardly capable of drawing on a level road half the weight of the improved machine of to-day.

Originally the locomotives constructed in this country followed closely the model of the English imported engines, but these were found to be inadequate. The first improvement of importance was the swiveling truck, first suggested by Horatio Allen, but whose invention is accredited to John B. Jervis. This truck, placed under the front end of an engine, enables it to run around curves of almost any radius. As many of the first lines in the mountainous sections of the country were built with sharp curves in order to limit the cost of construction, this invention solved the problem of building an engine that might be successfully worked on them. The swiveling truck was first used on an engine on the Mohawk and Hudson railroad (New York) in 1831.

Another objection to engines of the English pattern was, that in running over rough or unevenly laid tracks these locomotives constantly ran off the tracks, and this led to the invention of the equalizing beams or levers (patented in 1838 by Joseph Harrison, Jr., of Philadelphia), by which the weight of the engine is always borne by three out of four or more driving-wheels.

It is recorded that one of the first locomotives built in this country, the "South Carolina," designed by Horatio Allen, had eight driving-wheels, but with few exceptions all the early locomotives had but four wheels.

In 1836 Henry P. Campbell of Philadelphia patented the use of two pairs of driving-wheels and a truck, the driving-wheels coupled by rods. So generally has this plan of construction been adopted in America that this description of engine became known as "The American type of locomotive."

The first "Mogul" engines were built in 1863; the first "Consolidation" engines about 1866. The tendency at all times was toward increased efficiency, which necessitated constant additions to the weight of the locomotive. The evolution of the locomotive from an engine weighing four to seven tons in the first years of railroad development to the seventy-ton machine of the present day, was gradual, though remarkably rapid, when it is considered that the whole fabric of the present almost perfect method of railroad transportation is the development of only seventy years.

The most radical departure of late years has been the use of compound locomotives, which has resulted in increased economy in fuel rather than

increased capacity of power and speed, and the highest speed-records are those which have been made by simple engines. The first successful compound locomotive built in the United States was designed and constructed by the Schenectady Locomotive Works. This was a heavy ten-wheel passenger engine for the Michigan Central railway, and it did excellent service.

One of the most noticeable changes since 1880 has been the increase of boiler-pressure from 130 or 140 pounds to 180 or 190 pounds, and many engines are now running with as much as 200 pounds pressure. The steam-pressures now used in locomotives are the same as carried in the latest steamship practice, where the steam is used in triple and quadruple expansion engines. Increase in boiler-pressure, by imparting greater velocity of steam, leads directly to higher speeds, as well as to increased economy in coal.

Driving-wheel weights have increased since 1880 from 12,000 or 14,000 pounds, which was then about the maximum figure, to the present figures of 20,000 to 23,000 pounds, and thus has had a most noticeable effect on the capacity of locomotives for power and speed. Light engines, of course, can make high speeds with small trains, but modern express service requires high speed with very heavy trains.

Considerable improvement in valve-motion has also been made, leading to reduced back-pressure and greater efficiency of steam; but it is noteworthy that these improvements are simply an improved design of the original Stevenson link-motion which has been used since locomotives were first built. The use of the compressed-air sand-blast has been of much value in producing greater adhesion of the driving-wheels on slippery rails. Much better protection is given to locomotive boilers now than formerly, resulting in increased economy of coal and greater capacity for power and speed.

Other noteworthy improvements consist in lightening all parts as much as strength will allow, in order to permit the use of the largest boiler. The capacity of a locomotive at high speeds is limited entirely by the power of the boiler to make steam, and as the maximum weight of the engine is limited by strength of rails and bridges, everything which tends to lessen dead weight and permit of large boilers has a direct effect in increasing the power and speed of locomotives. Cast-steel driving-wheels, for instance, are now largely used instead of cast iron; foot-plates are made of cast steel instead of cast iron, and in many other details cast steel and wrought steel have been substituted for iron, with a considerable reduction of weight and increase of strength.

The increase in boiler capacity has led to the use of much higher locomotives than formerly; fire-boxes are now put on top of the frames, and even extended over the wheels, in order to allow the use of larger grates. Fears were at first entertained that engines having these high centers of gravity would not be as safe for high speeds as the lower engines. These fears, however, proved unfounded, and the high locomotives are seen to have a more gradual and easy motion than the lower ones, and we know of no case on record where the high center of gravity has led to accident.

In freight service the same line of development has taken place as in passenger, it having been proved that the cost per ton per mile is less by hauling the most cars per train; though this is modified by competition, which has led to higher speed of freight trains, so that on some roads the fast-freight service approaches the conditions of heavy passenger service, as far as locomotive requirements are concerned, and some engines are frequently used for both classes of work.

For mountain service slow speeds are used, and all effort is directed to hauling the heaviest possible train. This involves the use of the greatest wheel weights that the rail will stand, and the use of the consolidation or decapod type of locomotives with four or five pairs of drivers coupled. For fast-freight service engines of the mogul or ten-wheel type, with 100,000 to 120,000 pounds on six drives, are used, and having as much as 70 tons total weight. For mountain service, consolidation or decapod engines are built, having 22-by-26 or 23-by-28 inch cylinders, with a total weight of from 80 to 100 tons, exclusive of tender.

PASSENGER-CARS. In early railroading there was little difference in appearance between the passenger-car and a freight caboose. Some attempts at ornamentation were made by a few of the companies, but these were modest enough, consisting simply of ornamental painting, scenes from life, more or less artistically executed, and very simple arrangements for comfort. In addition to improving the ventilation, candle-light was provided for night travelers, and in cold weather a stove in the corner furnished the heat which travelers had been wont to draw from each other or in small degree from the straw with which the car-floor had been strewn. As travel increased, however, and the need of better accommodations became apparent, the passenger-car was lengthened and its height increased; its ventilation was improved and conveniences of various kinds added. A great step forward was taken when provision was made for sleeping in a recumbent posture. A night car with rude sleeping-berths, such as are in use on steamboats, but furnished with no bedding, was the first form of sleeping-car which surprised and delighted the traveling public. It was introduced on the Cumberland Valley railroad, in Pennsylvania, so long ago as 1836, and in November, 1838, the Philadelphia, Wilmington and Baltimore put on a similar car.

In 1854 sleeping-cars having the same general features as those now in use were introduced. This car provided seats for about sixty passengers, and at night these seats were converted into flat berths. The inventor was Theodore T. Woodruff. The right to build and operate the car was later acquired by Webster Wagner.

Pullman sleeping-cars were introduced in 1864 or 1865. In 1867 a hotel-car, the first in use, was built by him for the Great Western railway of Canada, and in 1868 Wagner built the first two drawing-room cars ever run for pay. Various styles of special cars have since been built; as, the hotel car, the private car, the hunting-car, the observation-car, the library-car, the dining-car, the composite car, and the combination-baggage-dining-room-car—all worthy of mention. Buffets were introduced by the Pullman Company into parlor and sleeping cars in 1883. For supplying heat alone, improvements in processes to the number of several hundred have been patented. Heating by salt-water circulation once displaced the use of stoves; afterward, steam-heating was substituted; finally, successful experiments in heating cars by electricity have been recorded. In lighting passenger-cars several forms of compressed gas have been substituted for candles and oil-lamps. All first-class passenger and sleeping cars are now equipped for electric lighting, so that such illumination can be introduced at any time. Water

for toilet purposes is supplied on first-class cars, and on Pullman, Wagner and many private cars both hot and cold water are provided. The water is stored in tanks underneath the cars and forced by air-pressure into the basins. The air-pressure system was first put into use in February, 1888, by the Pullman Company, and is now in general use on their cars. It is applied to lavatories, closets, bathrooms, dining-rooms and barber-shop basins. Hot water or cold water may be drawn from the same faucet, according as it is turned in one direction or in the other.

For steadying the cars while in motion and preventing accidents, various devices have been adopted. One of the most important of recent improvements in palace-cars is the patent buffer at the end of each platform. This obviates the danger of getting the foot caught between the platforms, and also imparts a steady motion to the train. In case of a collision it effectually prevents the cars from telescoping; a security still further augmented by the vestibule connections originated by the Pullman Company in 1887. The first vestibuled train was built at Pullman, and put into service on the Pennsylvania railroad in April of that year.

This vestibule construction involves a solidly continuous system of combination bottom and top buffers, and heavy diaphragm frame-plates rigidly attached to the buffers, and which permit of the use of additional cushion springs at both top and bottom of the frame-plate buffers, thus distributing the impact in collision to the parts of the framework of the car best calculated to withstand the shocks. A vestibule train is perfectly sinuous, and is virtually under one continuous roof, with inclosed passages from car to car.

The Pullman anti-telescoping devices consist of heavy steel plates two feet wide, extending across the car and bolted to the bottom of the sills and between them and the platform timbers; also of heavy steel angle-bars back of the corner-posts or end framework of the car, strongly secured to the heavy steel plates. These angle-irons extend in a continuous bar upward and across the roof, and downward on the opposite side to the sills, thus reinforcing the end framework of the car with a hollow cylinder casement of great strength, which not only keeps the car-frame in proper shape, but prevents the end of the car from being broken in case of collision.

Since 1880 the length of passenger-cars, which was then from forty to fifty feet, has been greatly increased, so that now sixty feet is not an unusual length, and many recently built Pullman coaches are seventy feet in length over ends. The body-framing of cars, also, has been greatly improved; trucks are much heavier, with larger wheels; and brakes have been improved by the quick-action feature. Much attention has also been given to the improvement of springs; and comfortable high-back seats have been introduced, rendering riding far more comfortable than formerly. Great advances, too, have been made along the line of art-work, to conform to new styles adopted from time to time.

The government has already issued 3,000 patents for railroad brakes alone, 7,000 for railway draft appliances, 6,000 for railway rolling-stock, and 8,500 patents are classed under the head of railways. Four fifths of these patents have been issued since 1880, an evidence of immense inventive activity. During the year 1894, 684 patents were issued for improvements on cars and parts of cars, car-couplers alone receiving 218 patents. The railways and railway appliances received 562 patents in 1894, as against 735 for the year before.

FREIGHT-CARS. The introduction of steel rails led to the construction of heavier freight-cars, for it was found that such rails would bear heavier loads without danger. By increasing the weight of the car from, say, 18,000 pounds to 21,000 pounds, its capacity was increased from 20,000 to 30,000. A further increase in weight to 22,000 or 24,000 makes it possible to carry a load of 40,000 or more. The loads can be increased in weight faster than the cars, and thus the "paying" weight constitutes a larger percentage of the total hauled. The normal freight-car in 1870 weighed 18,000 pounds and carried a load of 20,000. Freight-cars of to-day are from 34 to 40 feet in length, weigh from 29,000 to 36,000 pounds, and carry loads of from 60,000 to 70,000 pounds, the 60,000-pound car being now considered the standard. During the year 1895–96 coal and ore cars of 80,000 pounds capacity were added to the equipments of a few of the leading railroads.

The following table shows the relative increase since 1876 in dead weight of car, and paying load:

YEAR.	DEAD WEIGHT OF CAR.	WEIGHT OF PAYING LOAD.	TOTAL WEIGHT LOADED.	WEIGHT OF CAR. PERCENTAGE OF TOTAL.	PAYING LOAD. PERCENTAGE OF TOTAL.
	Lbs.	Lbs.	Lbs.	Per cent.	Per cent
1876-----	20,500	20,000	40,500	53.62	46.38
1882-----	24,000	40,000	64,000	37.50	62.50
1889-----	27,700	60,000	87,700	31.59	68.41
1895-----	36,000	80,000	116,000	31.04	68.96

The construction of wooden cars of a greater capacity than 70,000 or 80,000 pounds is not probable, because the increase which would be necessary in size and weight of the parts would increase the dead weight and decrease the paying load. Future development must come through the increased use of metals in car construction. Car-trucks now are made entirely of steel, and it is predicted that in the near future the entire bodies of freight-cars will be made of steel. Steel cars were built by the Carnegie Steel Company and put on exhibition at the convention of the Master Car-Builders' Association in 1896.

In variety, freight-cars are especially adapted to many uses. There are now ventilated refrigerator-cars for the transportation of fruits, vegetables, fresh meats and other perishable goods; cattle-cars with arrangements for watering and feeding stock while in transit; single and double deck cars for sheep and hogs; improved box-cars for general merchandise; special cars for furniture and other light-bulk freight; improved flat-cars for lumber and stone; double and single hopper-bottom cars for coal, crushed stone, etc., and special cars for ores, of which the heavier ones are often lined with iron plates. There are poultry-cars, in which birds are fed and watered. Other special cars are caboose-cars, horse-cars, coke cars, barrel-cars, as well as flat-cars from 60 to 70 feet in length, upon which street cars are shipped.

SAFETY APPLIANCES. In 1880 freight-cars were used with single brakes, and the brake-beams were of wood and in most cases not trussed. By an act of Congress, approved March 2, 1893, the companies engaged in interstate commerce are required to equip their cars with automatic couplers and brakes and other appliances for insuring safety to trainmen, and the companies

were allowed until Jan. 1, 1898, to comply with these requirements.

Improved brakes enable trains to make better time, to be quicker halted and thereby avoid accidents. Improved draw-bar and buffer attachments have also been applied, likewise additional grab-handles, steps and ladders for the protection of trainmen. All freight-cars now building, with few exceptions, are equipped with Master Car-Builders' vertical-plane automatic couplers, and the old link-and-pin draw-bar in general use in 1880 is rapidly being displaced.

One part of a car has not yet been treated fairly, and that is the wheel. The flange of the wheel is no larger than many years ago, and the weight of the wheel has been increased but little. The steel tire has gained largely in weight, and the wheel should be increased to at least 650 pounds, and 700 pounds would be still better.

While there are many different doors in use, there is none wholly satisfactory. The same applies to car-roofs. Also, there should be uniform type of draft-rigging. These three matters are of pressing importance, for it is the universal experience that the roof, the doors and the draft-rigging are the great items of expense in maintaining equipment.

The following table shows the equipment growth of American railroads from 1880 to 1900:

Year.	Locomotive Engines.	Revenue Cars.			Total.
		Passenger.	Baggage, Mail and Express.	Freight.	
1880---	17,949	12,789	4,786	539,255	556,930
1885---	25,937	17,290	6,044	805,519	828,853
1890---	32,241	22,958	7,253	1,061,917	1,092,241
1900----	38,065	26,786	8,209	1,350,258	1,385,253

Since 1880 the number of locomotives has increased 106.64 per cent; of passenger-train cars 104.10 per cent, and of freight-train cars 128.25 per cent. In 1880 the ratio of passenger-cars to locomotives was as 98 to 100; in 1895 it was as 97 to 100. In 1880 there were 30.04 freight cars for each locomotive, and in 1895, 33.18. Since 1882, the year for which the statistics were first compiled, the average tonnage weight of a freight train, measured by the number of tons hauled per freight-train mile was 125.86 tons; in 1895 it had increased to 180.23 tons.

The average number of miles run per annum by each freight-car in service ranged from about 450 miles in 1883 to 408 in 1888, then increasing to about 450 in 1890, 1891 and 1892, followed by a further decline to less than 400 miles in 1894 and 1895. It is because of this unsatisfactory lack of uniformity in service derived from their freight equipment that the railroad companies are now carefully considering plans looking toward the adoption of some system of pooling freight-cars.

Speed. Attention was first drawn to the possibility of materially lowering the time allowance on long runs by the performances of the train which bore the Jarrett and Palmer theatrical troup from New York to San Francisco in June, 1876. The run of 3,312 miles was made in just a quarter of an hour short of three and one half days, or at the rate of 40.18 miles per hour. At the present day this would be regarded as a creditable performance, but twenty years ago it was thought to be and was something phenomenal. This train also made the longest run without a stop which has ever been made—from New York to Pittsburg, 440 miles. It is also notable as having been hauled from Ogden to Oakland, 881 miles, by one engine, in charge of the same engineer for that entire distance.

In 1888 regular trains were run between New York and Philadelphia at the rate of 42 miles an hour by the Philadelphia and Reading railroad, and 43.6 miles an hour by the Pennsylvania rail road. In August, 1896, the regular run on the Pennsylvania line was made at the rate of 48.6 miles per hour, while a special train made the run, Sept. 18, 1895, at the rate of 53.88 miles per hour. Very fast time is also made by Philadelphia and Reading trains between the same points, one of those trains having broken the speed-record in November, 1892, by covering a mile in 37 seconds, and 5 miles in 3 minutes and 25 seconds, the speed for the mile being at the rate of 97.3 miles an hour, and for the 5 miles an average of 82.95 miles per hour. The first remarkable speed-run of which there is a record was made in April, 1885, by a train on the Panhandle road (Pittsburg, Cincinnati, Chicago and St. Louis railroad), which was run from Pittsburg to Denison, 93 miles, at the rate of 55 miles an hour, and from Denison to Newcomerstown, 14 miles, at the rate of 72 miles an hour. In 1886 this record was broken by the Pennsylvania fast express from New York to Chicago, which made a part of the run at the rate of 75 miles an hour, averaging for the whole distance 38.5 miles an hour. In the same year a special train on the New York Central, carrying Wm. H. Vanderbilt, made a run of 81 miles in 61 minutes. On Dec. 1, 1889, a special train of two officers' coaches carrying officials of the Atchison system ran from Bakersfield, California, to Lathrop, 220 miles, in 222 minutes. The shortest time consumed for a single mile was 45 seconds, and a stretch of 10.5 miles was run in 8 minutes, or at the rate of about a mile in 45.7 seconds. Another remarkably fast run was made Nov. 19, 1889, on the Union Pacific railroad, from Green River, Wyoming, to Ogden, Utah, a section where grades are very difficult and the curves sharp and numerous. The 76 miles were covered in 65 minutes.

In 1891 the New York Central railroad began to make records for speed, and has continued steadily to improve on its performances until at the present time that company's famous engine No. 999 has the world's record for sustained speed. In September, 1891, the run from New York to Buffalo was made at the rate of 59.5 miles an hour, the 436.32 miles being covered in 440 minutes. On Nov. 8, 1892, on the same

road the Empire State Express, consisting of four cars, pulled by engine No. 893, was run from Syracuse to Albany, 115.76 miles, in 110 minutes, an average velocity of 63.14 miles an hour. The section from Syracuse to Utica, 52 miles, was covered at a speed averaging 67.38 miles an hour. On May 9, 1893, engine 999 on the New York Central ran a mile in 35 seconds and again in 32 seconds; and on May 19, 1893, the same engine ran 5 miles in 3 minutes, or at the rate of 100 miles an hour. The run from Syracuse to East Buffalo, 146 miles, was made in 135 minutes actual running-time, or at the rate of about 65 miles an hour. During the Columbian Exposition the run from New York to Chicago over the New York Central and the Lake Shore and Michigan Southern roads was made regularly in 20 hours, or at the rate of 48.2 miles an hour. At the present time the regular run from New York to Buffalo is made at the rate of 50.7 miles an hour, while the run from New York to Chicago was made by engine 999, drawing a train over the New York Central and Lake Shore roads, on Oct. 24, 1895, at the rate of 64.8 miles per hour, a portion of the distance being covered at the rate of 92.3 miles an hour. This is the fastest time for such a long distance that has ever been made.

The Knickerbocker Express of the Cleveland, Cincinnati, Chicago and St. Louis railroad, on Jan. 27, 1895, was run from DeGraff, Ohio, to Bellefontaine, on an ascending grade, at the rate of 55 miles an hour. On the Chicago, Burlington and Quincy road a train of five mail-cars and one express-car is run from Chicago to Union Pacific Transfer, 498.9 miles, at the rate of 43.8 miles an hour, the run from Chicago to Galesburg, 163 miles, being made at the rate of 49.7 miles an hour, or 51.9 miles, deducting stops. On April 21, 1895, a locomotive and one car carrying newspapers was run from Camden to Atlantic City, New Jersey, over the Pennsylvania railroad line, at an average rate of 76.46 miles per hour, and 25 miles of the run, from Winslow to Absecon, was made at the rate of 83 miles an hour. It is claimed for the Baltimore and Potomac, another Pennsylvania railroad line, that on Aug. 3, 1895, a train was run from Landover to Anacostia, District of Columbia, 5.1 miles in 3 minutes, or at the rate of 102 miles per hour. For distances over one thousand miles the best time is made on the Southern Pacific. The "Sunset, Limited" train on that road runs from New Orleans to San Francisco twice a week, making the run of 2,489 miles at the rate of 32 miles an hour. Another very fast long-distance run is made by an Atchison, Topeka and Santa Fé flyer, which covers the 2,265 miles between Chicago and Los Angeles at the rate of 30.5 miles an hour, such a train being run every day.

These high rates of speed were made possible by the adoption of compound locomotives. These engines have double cylinders for high and for low pressure, and are the most highly developed type of locomotive thus far produced. They burn anthracite coal, which is smokeless. A speed of one hundred miles an hour is developed daily by such engines on the New York Central, Pennsylvania, Lake Shore, Philadelphia and Reading and other first-class roads. The speed is so furious the engineer dare not put his head out of the cab for fear of being blinded and suffocated.

In Great Britain efforts have been made to excel the speed attained on the New York Central road. A special train was run over the West Coast line from London to Aberdeen, a distance of 539.75 miles on Aug. 22–23, 1895, at an average speed of 63.24 miles per hour elapsed time, and 63.93 miles per hour running-time. The train weighed 150,080 pounds. Inspired by that effort, a special train on the New York Central, weighing 361,000 pounds, ran from New York to Buffalo at an average speed of 63.54 miles an hour elapsed time, and 64.22 miles an hour, time in motion. And as supplementing this feat, the same engine made the run from Buffalo to Chicago at the rate of 63.61 miles an hour, elapsed time, and 65.07 miles an hour, time in motion.

Pooling. In America the earliest railroad pools were developed in New England, but they were on a moderate scale and attracted little attention. The first pool having an important history was the Chicago-Omaha pool, established in 1870. This was followed in December, 1872, by the first anthracite-coal combination; the year following, the pooling agreement entered into between the railroad and steamship lines of the South went into effect; the "cattle eveners' pool" was organized in 1875, the Southwestern Railway Association in 1876, the Trunk Line Commission and Central Traffic Association in 1877. At the time of the passage of the Interstate Commerce-Law most of the competing railroads of the country were banded together in one or another of a series of pooling associations.

Three forms of pooling have been practiced: anthracite-coal combinations, cattle and petroleum eveners' pools, and pools of general freight and passenger traffic. In the anthracite pool were the Philadelphia and Reading, Central of New Jersey, Delaware, Lackawanna and Western, Delaware and Hudson, Pennsylvania railroad and Pennsylvania Company. The chief objects in view were to maintain a remunerative price for anthracite coal, chiefly by restricting the output of that product, and to divide between the carriers the total amount of competitive traffic in accordance with agreed percentages. This agreement continued in force until August, 1876. On Jan. 1, 1878, a second combination went into effect, but it was dissolved at the close of the year, mainly because one of the parties to it refused to accept terms agreed upon by the others. During most of the years from 1878 to 1892 similar compacts were in force. The combination that attracted widest attention was the coal combination of 1892. In February of that year the Philadelphia and Reading leased the Lehigh Valley railroad and the Central Railroad of New Jersey, and made at the same time an agreement to buy the coal of their allied coal companies, the Lehigh Valley Coal Company and the Lehigh and Wilkesbarre Coal Company, and of the individual operators, at certain percentages of the prices that might be received for coal delivered at tide-water near New York. The plan covered practically the entire anthracite interest.

Suits were brought in Pennsylvania to annul the lease of the Lehigh Valley, and in New Jersey to annul the lease of the Central Railroad of New Jersey. In the latter case the chancellor of New Jersey decided against the lease in July, 1892, in consequence of which the road was surrendered to its owners in August. In Pennsylvania, on the other hand, the court, in December, 1892, decided in favor both of the lease of the Lehigh Valley and of the pooling agreement. In 1893 the contracts with the Lehigh and Wilkesbarre Coal Com-

pany and the Lehigh Valley lines were canceled, in obedience to orders of the New Jersey courts, and an order was issued by the chancellor perpetually enjoining those leases. Thus ended the celebrated coal combination of 1892.

The cattle eveners' pool was organized in 1875 to terminate a protracted struggle between the trunk lines from Chicago to Boston, New York, Philadelphia and Baltimore, which had frequently led to the transportation of live-stock at rates far below the actual cost. The plan involved an agreement between the rival companies to divide the traffic at a fixed percentage, and an engagement with an association of principal shippers to arrange their shipments so as to insure to each company its allotted share of the traffic. The shippers were, therefore, known as "eveners." In consideration of the services rendered by the eveners, they were allowed a rebate not only upon shipments made by themselves, but also upon all cattle shipped by other parties to other places east of Chicago. The scheme met with strenuous opposition, and was abandoned by the railroads in 1879. For petroleum the Standard Oil Company acted as evener under conditions similar to those described relating to live-stock traffic, and it received advantages in rates similar to those granted to the cattle eveners.

Other pools were devised to maintain rates on competitive traffic, in some cases by dividing the business between the railroads according to agreed percentages and in others by dividing the earnings from such business, the first method being known as a freight pool,' the latter a "money" pool. The affairs of these pools were usually directed by a board consisting of a managing officer from each of the roads. There was also a commissioner appointed, whose duty it was to see to the enforcement of the agreement.

The earliest pool of this nature was made in 1870, between the Chicago and North-Western, the Chicago and Rock Island and the Chicago, Burlington and Quincy railroads, all three of which connected Chicago and Omaha. These railroads were of nearly equal length and financial resources, and their through business represented a large percentage of their total freight traffic, and produced an important share of their respective revenues. Accordingly, a pool was formed, and was continued without change for about fifteen years, when the expansion of these systems made new conditions. It passed through the Granger movement unshaken.

The competition in certain districts of the South had been even more reckless and ruinous than elsewhere. To avoid these evils, four railroads connecting Atlanta, Georgia, with the seaboard formed a pool in December, 1873; secured the co-operation of other lines, and established the Southern Railway and Steamship Association, affairs of which were directed by Albert Fink, vice-president of the Louisville and Nashville railroad. In three years this organization came to include practically all of the railroads south of the Potomac and Ohio rivers and east of the Mississippi, together with a large number of connecting or competing steamship lines. The objects of the association were achieved by fixing rates, arranging a basis of classification, and especially by the establishment, in 1875, of a clearing-house to settle through-traffic accounts.

The Southwestern Railway Association, organized in September, 1876, embraced the Chicago and Alton, the Chicago, Burlington and Quincy, the Chicago and Rock Island, the Hannibal and St. Joseph, the Kansas City, St. Joseph and Council Bluffs, the Missouri Pacific and the Wabash lines. Before it was formed the roads extending from Chicago, St. Louis and other Mississippi River points to Kansas City, Leavenworth, Atchison and St. Joseph engaged in frequent struggles for competitive traffic, disregarding their published tariffs and giving special rates to the injury of the public and themselves. Large shippers had contracts at half-rates, and a few secured them at still lower figures. None but the unwary paid tariff rates. The remedy proposed contemplated that each road should obtain such a percentage of the business as it was fair to presume it could secure if agreed rates were maintained by all routes.

In July, 1877, the Trunk Line Commission and Central Traffic Association were formed, these being, in the extent of mileage covered, the most important pooling agreements entered into up to that time. For a long time heavy trunk-line traffic was relatively unimportant, because of the lower cost of shipment by water, but the improvements of roadway, engines and cars and the growth of return or west-bound traffic made it possible for the railroads to compete for through traffic, which resulted in wars of rates. These wars on a large scale began in 1869, when the Pennsylvania and the New York Central had obtained control of Chicago connections.

In July, 1874, the New York Central, the Pennsylvania and the Erie roads and their western connections entered into an agreement at Saratoga to maintain rates. But owing to the recklessness of the Grand Trunk of Canada and the refusal of the Baltimore and Ohio to enter the pool, an extensive railroad war broke out in the spring of 1875, and continued until late in the next year. During its continuance first-class rates were quoted at 25 cents per hundred, fourth-class at 16 cents, while actual rates went much lower. Exhausted by this destructive contest, the companies in July, 1877, entered into agreements for the division of west-bound traffic, and two years later included the more complicated east-bound traffic. These agreements proved insufficiently comprehensive, and were broken and modified several times until 1884.

Meanwhile, the existence of these agreements led to the formation of three new competing lines. In 1882 the Chesapeake and Ohio connections were completed, and the Delaware, Lackawanna and Western extended its line by lease to Buffalo; while on Jan. 1, 1884, the West Shore route was opened between New York and Buffalo. The

usual rate war was precipitated by the entrance of these new competitors into the field, and it was fiercer than the contests which had preceded it. It was terminated by an agreement signed by eight competitive trunk lines east of the Alleghanies, Nov. 6, 1885. This new agreement differed from the old ones in the assumption of responsibility by the trunk lines for their western connections, which the next year entered into a similar compact, thus forming the Central Traffic Association, with a passenger committee, for the maintenance of fares.

The Southern Freight Association, formed December, 1885, covered all freight for which two or more of the associated roads might compete, passing through all points on or west or south of a line through Buffalo, Salamanca, Pittsburg, Wheeling, Parkersburg and Huntington. In the same month the railroads south of the Potomac and the Ohio and east of the Mississippi organized the Southern Passenger Committee to maintain suitable rates of fare.

On Dec. 19, 1885, in order to secure harmony and uniform rates, the Freight Traffic Association of the Middle States was formed. It comprised 37 railroads in the middle and more northern of the South Atlantic states, including all of the great trunk lines. Similar organizations for New England and the lines competing for traffic west of the Mississippi as far as the Pacific Coast were multiplied beyond convenient enumeration, when the Interstate Commerce Act was passed.

The Interstate Commerce Law went into effect April 1, 1887. Many railroad companies now sought to maintain rates by such adjustment of tariffs as would, in effect, produce apportionment of traffic among competing lines, and agreements containing provisions to this effect were from time to time filed with the Interstate Commerce Commission.

But while protesting their willingness to obey the law, many of the railroads continued practices for the prevention of which the law had been framed.

On Jan. 8, 1891, representatives of the Western roads in control of the trans-Mississippi traffic organized the Western Traffic Association, to maintain rates through the distribution of competitive traffic according to agreed percentages. The ground to be covered included all state and interstate freight and passenger traffic, competitive between any two or more of the members of the association, having origin or destination in Illinois, Minnesota, Wisconsin, upper Michigan, or any state or territory west of the Mississippi River, except business to and from trans-Pacific ports, Texas, Arkansas, Mexico, and the Indian Territory. On Oct. 11, 1892, the association was dissolved because certain of its members took undue advantage of others. That the law was being violated before and during the continuance of this agreement, was a general belief, but it was difficult to obtain evidence upon which to found charges. However, the Interstate Commerce Commission brought suit against the Trans-Missouri Freight Association and the 18 railroads constituting it, under the anti-trust law of March 2, 1890. The decision in the first instance and also on appeal in October, 1893, affirmed the legality of the association. Encouraged by this decision, new combinations, virtually founded on pooling contracts, were made, as by the Central Traffic Association, the Western Freight Association, the Southwestern Traffic Association, and the Trans-Missouri Association.

Meanwhile, public sentiment underwent a change as to evils of pooling. The law had not effected the good expected of it, but had really proven a failure from the outset. Complaints were heard that the system under it encouraged the discrimination between shippers, which the law was intended to prevent, and that it favored the restless and bargaining trader and the unscrupulous and reckless railway at the expense of the fair-minded shipper and honest railway official who aimed to comply with the provisions of the law. Measures to amend the law were brought forward in Congress, both in the Senate and in the House, the last proposal being in 1894, but no bill succeeded in passing both houses.

On Nov. 19, 1895, 31 leading railroad companies entered into an agreement that went into effect January, 1896, to co-operate with each other and adjacent transportation associations to maintain just rates, fares, rules and regulations on state and inter-state traffic, to prevent unjust discrimination and to secure reduction and concentration of agencies, and the introduction of economies in the conduct of the freight and passenger business. The association has jurisdiction over all competitive traffic (except coal, coke, iron-ore, mill-cinder, limestone and petroleum, and also all traffic destined to or coming from Florida, Georgia, North and South Carolina, Virginia and West Virginia, south of the south line of the Chesapeake and Ohio Railway) which passes to, from or through the western terminal of the trunk lines, as now fixed or as they may be designed hereafter. On publication of this agreement suit was brought by the United States at the request of the Interstate Commerce Commission, praying for an injunction on the grounds that the agreement was in restraint of trade; an infraction of the anti-trust law of July, 1890, and contrary to the inter-state commerce law.

In March, 1896, representatives of railroad and steamship lines engaged in transcontinental traffic, formulated an agreement similar to that which existed up to Jan. 1, 1893, when the former transcontinental association was dissolved. It provides for a guarantee of $870,000 yearly, to be divided in the ratio of 45 to 55 between the Pacific Mail Steamship Company and Panama Railroad Company, and is sustained by roads having Pacific terminals.

On April 1, 1896, the Southwestern Association was reorganized, and an agreement adopted for the pooling of all Texas traffic from the seaboard north and northwest.

Electricity as a Motor. It is almost wholly since 1885 that attempts at applying the power of the electric current to the propulsion of railway cars have been made, and about five years later managers of street railways in general so far acknowledged the importance of the new form of traction as to give it a trial, and yet in a few years after animal traction was practically abandoned; the cable system is being rapidly superseded; steam dummy lines have gone the way of the horse road; the urban elevated railroads are pointing the same way, and even the standard railroads have been forced to adopt defensive measures against the encroachments and competition of the rapidly-expanding electric systems.

At first the trolley lines bid only for city and suburban passenger traffic, but in a short time they entered the field of inter-urban passenger traffic, with such success that they decided to compete for all local business. In pursuance of this policy they first secured contracts for carrying the United States mails; this was followed by making arrangements with the express companies for a share of that class of traffic, and now several of them have undertaken to compete for general freight business. The competition of electric with steam lines has made such inroads

into the earnings of the latter, that important companies, like the Pennsylvania, New York Central, and New York, New Haven and Hartford, have been forced to adopt it on certain of their branch lines, where it has given unqualified satisfaction.

Three methods of applying electricity are in use: the storage battery, the conduit system, and the widely-adopted overhead trolley. The trolley is only regarded as a makeshift, and the engineering problem of the day is the determination of a plan of electric propulsion for general use on railroads. Electric locomotives have been built, and others are under construction. Those in use on the Belt Line of the Baltimore and Ohio have developed enormous power, and maintained a rate of speed, so that locomotive-builders and manufacturers of electric motors have entered into compacts for the joint production of electric locomotives.

ELEVATED STREET RAILROADS were first introduced into New York City; and an account of them is given in Vol. XX, p. 249.

The elevated-railroad system has been put in successful operation, first at Coney Island, where a line one mile long has been in operation since June, 1881; then in Brooklyn, in which two systems operate over 28.41 miles of streets; and finally in Chicago, where three companies operate lines aggregating 47.94 miles. Two of these Chicago railways, with 39.38 miles of line, are operated with electric power.

The cost of the New York system to June 30, 1895, amounted to $73,154,524, consisting of $52,085,339 for cost of road, $4,499,990 for equipment, $2,155,195 for real estate and buildings, the remaining $14,014,000 representing cost of leases. The cost per mile of road equaled $2,024,198. The mile of road at Coney Island cost $218,098. The Brooklyn system cost $42,436,831, or at the rate of $1,493,729 per mile. The two steam elevated railroads in operation in Chicago on June 30, 1895, together 14.94 miles long, cost $33,907,783, an average of $2,269,597 per mile. An electric elevated system, having 33 miles of line, was put in operation about June 1, 1895, the cost of which, as represented by its stock and bond issues, amounts to $42,000,000 or $1,272,727 per mile. The aggregate cost of elevated railroads in the United States is, therefore, $181,717,235. The average cost per mile amounts to $1,601,174 as compared with $87,309 per mile for street railroads and $54,844 per mile for standard steam railroads.

The system of elevated railroads has also been applied to trunk lines of railroad running through the business portions of populous cities, first in Philadelphia, then in Jersey City, and is now under consideration by the lines entering Chicago. Although the railroads oppose compulsory legislation on this point, it is admitted to be a great advantage to them in running their trains more rapidly and with less liability to serious accidents.

PUBLIC SERVICE OF RAILWAYS. In 1882 the number of passengers carried by railroads was 289,030,783; in 1895 the number was 543,974,263, an increase of nearly 90 per cent. In passenger movement, which means the total number of miles traveled by all passengers, the increase was from 7,483,059,934 in 1882 to 12,642,202,551 in 1895, an increase of about 70 per cent. It is a fact worthy of note that in 1895 the number of passengers carried and the number of miles they traveled was nearly equaled in 1890, and was very largely exceeded in all the years between 1890 and 1895.

In 1882 the average receipts per passenger per mile amounted to 2.50 cents, the average receipts per passenger to 65.09 cents, the average receipts per passenger-train mile to 113.72 cents, and the average receipts per mile of railroad to $1,964. In 1895 a considerable reduction is noticed, the average receipts per passenger per mile being 2.068 cents, the average receipts per passenger 48.10 cents, the average receipts per passenger-train mile 79.94 cents, the average receipts per mile of railroad being $1,460.

In 1882 the number of tons of freight moved was 360,490,375; in 1895 the number was 763,799,883, the increase within that period being 111.88 per cent. In freight movement the increase was from 39,302,209,249 in 1882 to 88,567,770,801 in 1895, an increase of 49,265,561,552 in the aggregate, or 125.35 per cent. The highest recorded number of tons carried in any year was in 1895, but in 1890 the figures of the later year were very nearly equaled, while the movement was 2,000,000,000 greater.

In 1882 the average receipts per ton per mile amounted to 1.236 cents, the average receipts per ton to 134.75 cents, the average receipts per freight-train mile to 159.21 cents, the average receipts per mile of railroad to $5,074. In 1895 the average receipts per ton per mile were 0.839 cents, the average receipts per ton 97.38 cents; the average receipts per freight-train mile 151.36 cents, and the average receipts per mile of railroad $4,151.

CHARACTER OF TRAFFIC. Full and accurate returns of the classification of freight traffic for the years covered by this article are not available, but in the following statement will be found the percentages for the years 1890 and 1895:

DESCRIPTION.	1890.	1895.
	Per cent.	Per cent.
Products of agriculture	13.75	12.20
Products of animals	4.79	4.46
Products of mines	49.05	50.32
Products of the forest	8.75	8.05
Manufactures	14.25	12.95
Merchandise	4.32	6.94
Miscellaneous	5.09	5.08

No details of passenger traffic whatever are available, for the reason that the data has never been collated. For the same reason it is impossible to present any correct figures as to the cost and profits of either passenger or freight traffic, this information being called for by no board of railroad commissioners in this country, except that of New York state; and in order to comply with this requirement, the railroads have been compelled to estimate the cost of conducting passenger and freight business on the erroneous basis of an apportionment of gross expenses to each class of traffic according to their train-mileage.

STATEMENT BY GROUPS OF FREIGHT CARRIED AND FREIGHT MOVEMENT OF THE RAILROADS OF THE UNITED STATES AT THE CLOSE OF THEIR FISCAL YEARS 1882 AND 1895.

Massachusetts. The first railroad built in Massachusetts was the Granite Branch, but the first regularly incorporated road was the Boston and Lowell.

Connecticut. The New York, Providence and Boston was the first railroad opened in Connecticut, as it was also the first in Rhode Island. It was opened Nov. 10, 1837. The Hartford and New Haven, begun in 1836 from Hartford to New Haven, and about one half of the line (18 miles), was opened in 1838, the whole 36.25 miles being opened in 1839. In 1900, the grand total of railway mileage in the U. S. was 193,345 miles.

STATEMENT SHOWING FOR ALL THE RAILROADS IN THE UNITED STATES THEIR MILEAGE, CAPITALIZATION, EARNINGS, EXPENSES, INCOME, ETC., AT THE CLOSE OF THEIR RESPECTIVE FISCAL YEARS ENDING IN 1880 AND 1895, WITH THE INCREASE AND RATE OF INCREASE WITHIN THE 15-YEAR PERIOD.

	1880.	1895.	INCREASE.	RATE INCREASE.
				Per Cent.
Miles of railroad owned	92,147	179,887	87,740	95.21
Capital stock	$2,708,673,375	$5,231,373,552	$2,522,700,477	93.13
Bonded debt	2,530,874,943	5,712,052,517	3,181,177,574	125.69
Other debt	162,489,939	419,558,711	257,068,772	170.51
Total	$5,402,038,257	$11,362,985,080	$5,960,946,823	$110.35
Miles of railroad operated	82,146	179,228	97,082	118.18
Earnings from freight	$464,748,928	$743,784,451	$279,035,523	60.04
Earnings from passengers	146,153,003	261,640,598	115,487,595	72.17
Miscellaneous earnings	2,831,679	99,859,218	97,027,539	*3,426.52
Total gross earnings	$613,733,610	$1,105,284,267	$491,550,657	80.09
Operating expenses	358,176,055	777,778,551	419,602,496	117.15
Net earnings	$255,557,555	$327,505,716	$ 71,948,161	28.15
Interest on bonds	107,866,328	242,943,243	135,076,915	125.23
Dividends paid	77,115,371	83,175,774	6,060,403	7.86

*The extraordinary increase in miscellaneous earnings is due to elevated railroads being brought into operation during the period.

STATEMENT SHOWING THE GROSS AND NET EARNINGS AND INTEREST AND DIVIDENDS PAID BY ALL THE RAILROAD COMPANIES OF THE UNITED STATES FOR THEIR RESPECTIVE FISCAL YEARS FROM 1880 TO 1900, BOTH INCLUSIVE.

YEARS.	GROSS EARNINGS.	NET EARNINGS.	INTEREST PAID.		DIVIDENDS PAID.	
			Per Cent.	Amount.	Per Cent.	Amount.
1880	$ 613,733,610	$255,557,555	4.26	$107,866,328	2.85	$ 77,115,371
1881	701,780,982	272,406,787	4.47	128,587,302	2.94	93,344,190

1894	1,080,305,015	322,539,276	4.11	237,620,367	1.64	85,278,669
1900	1,501,695,378	483,247,526	4.25	244,447,806	1.59	140,343,653

FINANCIERING. During the period from 1880 to 1884 there was an immense and unwarranted inflation in capitalization of lines of railroad. In the six years, 1879 to 1884, inclusive, there were listed on the New York Stock Exchange stocks and bonds of railroads aggregating $3,361,017,293, as follows:

In 1879	$698,074,074
In 1880	600,270,885
In 1881	763,880,151
In 1882	411,029,325
In 1883	617,507,884
In 1884	270,254,974
Total	$3,361,017,293

This statement shows the vast magnitude of the operations of the country in railways in the period from 1880 to 1884. A portion of these listings were the stocks and bonds of reorganized companies, such as Erie, Wabash and others, and were so far relistings under new names and forms.

That vast amounts of fictitious capital were floated during this period is well known and universally acknowledged. Its effect was to precipitate the panic of 1884, in reference to which Poor's Manual for 1885 says:

"Of the 40,000 miles of line built in the five years ending with 1883, no small part was built on speculation, and for that very reason, paralleled already existing lines. The most striking examples of the kind . . . are the West Shore and 'Nickel-Plate' lines. The general demoralization which has prevailed in railroad circles is due more to the construction of these two and to the ill-fortune which attended them than to any other cause, or it may be said, to all other causes. The effect has been to stop altogether the payment of dividends, which had been paid for a long time at high rates, by the Lake Shore and Michigan Central, and to reduce those paid on the New York Central from two per cent quarterly to one-half one per cent quarterly. The stoppage or reduction of dividends on these great lines created profound apprehension and distrust as to the value of all railroad properties. The earnings of other great trunk lines suffered in like manner if not to the same extent. A general disruption of the relations previously existing between the companies was the inevitable result. They seemed to be set wholly adrift without chart or compass. In the distrust and incoherency which prevailed, the various lines, especially the great trunk lines, struck out on their own account and bid wildly for business with very little reference to rates or to the result. Pools were dissolved almost as soon as they were entered into, as they always will be dissolved whenever there is not enough business to go round."

"Although West Shore and 'Nickel-Plate' seemed to be the occasion of the great catastrophe of 1883 and 1884, the real causes had been long at work in the wonderful success of signal instances of 'watering.' The real catastrophe occurred when these waterings took place. Incited by their success, our whole people became wild upon the subject of railroad construction, believing that two or three dollars could easily be made for every dollar put up, either by the success of their ventures or by the sale of their securities. In this mania or delusion the capitalist and adventurer alike shared. The promoters of West Shore, men of capital, put up their money in good earnest under the idea that they were embarking in an honorable and meritorious enterprise. The promoters of 'Nickel-Plate' built their line on speculation and for the purpose of selling it, securities being issued at the rate of two or three dollars for every dollar of cash paid. No small portion of the 40,000 miles constructed in the five years ending with 1883 was built upon the same plan and with the same object. Whatever their fate a large number of them became competitors for a business for which ample provision had already been made by existing lines. Railroads, unfortunately, seem to reverse the rule of 'the survival of the fittest' to 'the survival of the unfittest.' They can be used but for one purpose, and when they go into the hands of receivers they are to be run so long as the operating expenses can be paid. If the earnings are not sufficient for this purpose they are to be eked out by 'receiver's certificates.'"

The extent of "water" in the share capital of the railroads is hard to determine. Of the total share capital, $5,231,373,852, more than $1,250,000,000 is duplicated. The duplication arises in this way: The capital stock of the St. Louis, Iron Mountain and Southern Railroad Company amounts to $25,763,950, but this is owned by the Missouri Pacific Railroad Company, which in 1881 issued its own stock in the proportion of three shares for four in exchange for the Iron Mountain stock and carries the latter among its treasury assets. But as each company is still a separate corporation the capital of each is included in the summaries each year and there is in consequence a duplication to the extent of the increase in Missouri Pacific stock.

The elimination of this duplicated share capital would leave the "live" stock outstanding say $4,000,000,000, of which about $750,000,000 is preferred and $3,250,000,000 common stock.

In almost a corresponding manner there have arisen duplications in the funded debts of the railroad companies through the issuance of collateral trust bonds secured by a deposit of bonds of subsidiary roads as security for bonds of the parent organization. In such cases each issue of bonds appears in the balance-sheets of the respective companies as liabilities, and are in consequence included in the general summaries of all the roads.

Estimating the aggregate amount of collateral trust bonds in existence and other bonds in the companies' treasuries at $7,000,000,000, the net bonded debt of all the roads would be reduced to say $5,000,000,000.

With these changes the capitalization of the railroads may be summarized as follows:

Capital stock, common	$3,250,000,000	
Capital stock, preferred	750,000,000	$4,000,000,000
Bonded debt, mortgage bonds	4,300,000,000	
Incomes and other	700,000,000	5,000,000,000
Total stock and bonds, less duplications		$9,000,000,000

Of the common stock, vast sums have only a nominal value, such as the stock of the West Shore Railroad Company. How much of the remainder was issued without cash consideration it is impossible to ascertain, but it is within the bounds of safety to say that of the $3,250,000,000 stock now outstanding not more than $1,250,000,000 is full paid stock. This item of so-called "watered" stock is the rock upon which the railroad interest of this country has frequently struck.

In 1896, 63.6 per cent of the stock failed to pay any dividends, the dividends paid on the remaining 36.4 per cent averaging only 1.83 per cent on the whole amount of stock, and 5.04 per cent on the stock earning those dividends.

COMPARATIVE STATEMENT showing the amounts of capital stock upon which dividends were paid in 1882, and from 1886 to 1895 inclusive; the amounts upon which no dividends were paid; the relative percentages of such amounts, and the percentage of dividend payments to all stock and to that on which they were paid; also the amount of bonds on which interest was paid or charged against revenue during the same period, the "unproductive bonds" representing the amount of income bonds and bonds of a similar character on which no interest was paid; and those of new lines under construction at the close of each fiscal year, etc., etc.:

See also INTERSTATE COMMERCE LAWS and PACIFIC RAILROADS, in these Supplements, and RAILWAY, Vol. XX, pp. 264, 265. JOHN P. MEANY.

RAILWAYS, ELECTRIC STREET. There are two general methods of using electricity for the propulsion of street cars:

1. The direct method, by conductors extending from the dynamo along the track.

2. The indirect method, by the use of storage batteries, secondary batteries, or accumulators.

In the direct method the conductors may be overhead, underground, or on the surface.

In the conduit system the conductors are placed in a conduit between the rails or between the tracks. The wires must be bare and yet must be thoroughly insulated from the ground, a condition very difficult to obtain under such circumstances. A slot about five-eighths of an inch wide gives access to the conductors by means of a contact plow, but unfortunately also permits the flow of water, slush, mud, etc., into the conduit.

The overhead wire is suspended from poles by brackets or from cross-wires which span the street between poles on either side. When the street is of sufficient width, poles are placed in the center of the street between the two tracks, with bracket-arms carrying the conducting-wires. These poles are placed about 125 feet apart, and from actual experience are found to present little or no obstruction to traffic. The wires may be single or double. When single wire is used, the rails are utilized for the return current. When two wires are used, one wire carries the outgoing and one the return current. Contact is obtained with the wire by an over-running or an under-running trolley. The over-running trolley is a light carriage with one or more wheels resting on the wire.

A flexible conductor carries the current down to the car. The trolley is pulled along by the flexible conductor. The objections to the over-running trolley are, that it is difficult to keep the trolley on the wire, it is difficult to replace the trolley when it comes off, and any automatic system of switching on to a turnout, branch or Y is impossible. The latter is such a serious objection that except in special cases the over-running trolley will never be used. In the under-running trolley a light arm of the requisite length is mounted on the top of the car, reaching up to the wire. A wheel on the end of the arm is pressed up against the wire by means of springs at the other end, and the current is carried from the wheel down through the arm itself if made of metal, or through wires if the arm is made of wood. This arm is usually called the contact-bar. The under-running trolley is automatic in its action at curves, turnouts, etc., and follows the direction of the car. It turns on a swivel through the entire circle, and moves through an arc of 90° in a vertical direction. (See TROLLEY ROADS, in these Supplements.)

In the storage system, a battery of about 120 cells is carried on the car, and the motors are driven by the current from this battery. The advantages of this system are: The cars can run on any track; no wires, either overhead or underground, are required; each car is more independent than is the case in other systems.

The disadvantages are:

1. The extra weight of about two tons on each car; the power required to carry this dead weight in addition to that required to drive cars required by the other methods.

2. The lack of efficiency in the batteries. The highest efficiency claimed is 82 per cent. The actual practical efficiency is stated by many authorities as about 70 per cent.

3. Storage cars cannot be regularly operated on grades exceeding five per cent or six per cent. The power required on grades makes too great a demand on the batteries.

4. The expense. The cost of two sets of batteries per car is about $3,000.

5. The cost of maintenance. Batteries have not yet been made of sufficient durability to be operated economically. (See under *Secondary Cells*, ELECTRICITY, §109, in these Supplements.)

EFFICIENCY. The steam-engine is not an efficient machine. If we can utilize 15 per cent of the units of energy stored in the coal, we are fortunate. In

other words, we must expect a loss of 85 per cent of the heat-units in converting the other 15 per cent into mechanical power.

The dynamo electric machine, on the other hand, possesses a high degree of efficiency. No good generator runs below 92 per cent efficiency. The loss in the line depends upon the amount of copper used in proportion to the current to be carried. The size of the conductor is generally calculated for a loss of 10 per cent. The efficiency of the motor under favorable circumstances has been shown to be but little below the generator, in actual tests running as high as 91½ per cent.

In practice it would not probably be taken higher than 35 per cent. Starting, then, with 100 horse-power in the steam-engine, we lose 8 per cent in the dynamo in converting the mechanical into electrical energy. The output of the generator is then 92 horse-power. In the line we lose 10 per cent, and deliver 82.8 horse-power to the motor. Here we lose 15 per cent, and on the final reconversion into mechanical energy on the car we have 70.4 horse-power out of the original 100 horse-power. By no other known method could this power be transported to such a distance with so little loss.

Economy. This is a quality that appeals more directly to the railway official than others. An electric railway connects Omaha with Council Bluffs across the new bridge. To run twenty cars per day they consume five tons of slack, for which they pay $1.14 per ton. This is 28½ cents per day for fuel. These cars are scheduled at 15 miles per hour, and the average daily mileage per car is over 100 miles. Where natural gas or water is available, fuel may be even cheaper. On many different roads, from numerous measurements it has been found that where the grades are slight the power required averages from five to eight horse-power per car. The consumption of fuel varies from three to six pounds of coal per horse-power, according to the style of engine and its more or less economical operation.

On some roads, under very favorable conditions, the cost of renewals and repairs to electrical apparatus has been but a little below one dollar per day per car in actual operation. On other roads, under very favorable conditions, the cost of maintenance has been less than 25 cents per day per car.

A mean of the reports obtained from 11 roads in actual operation under different conditions shows a daily cost of operation of less than $2.50 per day, not including drivers and conductors.

The objections urged against the overhead wires are: They are dangerous, as they carry death-dealing currents; they are in the way in case of fires.

The railway wire should not be confounded with other electric wires. Arc and incandescent wires, telegraph and telephone wires, have simply to carry the current from the point where it is generated to the point where it is to be used, and so far as this purpose is concerned they may be above-ground or under-ground. The railway wire, on the other hand, must have current taken from it every differential of an inch from one end to the other. The wire must be bare, that the trolley-wheel may be in constant contact. To put this wire under-ground and to keep it properly insulated is a very different problem from burying the other wires. Now, as to danger. For railway work we use a constant potential generator, and the cars and motors are placed between the two conductors on the multiple-arc system. One conductor, the overhead wire, runs out from one pole of the generator; the other conductor, the rail, runs out from the other pole of the generator. An electrical connection between these two conductors completes the circuit, and the current flows through the connecting material, whatever it may be. If it be the motors on the car, then the cars move; if it be a man, he receives a shock.

Each connecting material, be it car, man or wire, receives a current of electricity which is determined by Ohm's law that the current is equal to the electro-motive force or pressure divided by the resistance. The electro-motive force is always 500 volts. With several cars in operation the amperes of current in the overhead system near the generator may run as high as 180, but each car takes its own proportion according to its resistance. The average resistance of a man is 4,000 ohms. If he places himself in the circuit he will receive a current which is measured in amperes by dividing 500 by 4,000, or, in other words, a 500-volt current can only drive ⅛ of an ampere through the average human body. It would not make a particle of difference to the man whether the overhead wire he touched was carrying a current of 1 ampere or 180 amperes, or 180,000 amperes. The effect in his case would be the same: he would receive one eighth of an ampere. Were this not true, then the whole multiple-arc theory would be false, and electric railways, as at present operated, would be impossibilities. It would then make no difference as to danger whether one or a million cars were in operation on the line.

The current for railway work has been fixed at 500 volts, as this is well within the safe limits. A shock from 500 volts is unpleasant, but not dangerous. If there were any real question of its being dangerous, then 400 volts or 300 volts would be used. The objection to this, however, is, that by reducing the voltage we must correspondingly increase the quantity in order to retain the same horse-power, and an increase in quantity (amperes) means an increase in the size of the overhead wires, which is objectionable. The danger-limit with the electric current is probably about 1,000 to 1,200 volts.

Every overhead wire is objectionable to the fire commissioners; the railway wire is less objectionable than any other, because there is but one wire, and this wire is in the middle of the street, away from the buildings.

If the single overhead working conductor is insufficient to carry the current necessary to operate the cars, it must be re-enforced by feeder-wires. These feeder-wires may be insulated and may be placed underground. The overhead wire may be divided into sections of three, four, six or one thousand feet in length. At the ends of each section a cut-out or switch may be placed on the pole like a fire-alarm box, so that in case of fire the current may be cut out of the section or sections in the vicinity of the

fire. The firemen would then have no difficulty in handling the wires, which in any event are easily cut by pliers with insulated handles. But it may further be considered whether the overhead wire may not be made an aid to the fire department. As Professor Thomson remarked to the insurance representative: "It will not be long before you will be taking power from these wires to put out your fires. It will not be long before we have electric motor fire-engines."

In 1906, the length of street and elevated railways was 36,931 miles, of which 36,212 miles were worked by electricity and 719 by other means. In 1907, about 1,200 street and intersuburban railway companies carried nearly 8,000 million passengers. These companies operate about 90,000 cars over an aggregate of 40,000 miles of track. Capital invested is about 4,000 million dollars.

RAIN. See GEOLOGY, Vol. X, pp. 237–39.

RAINBOW. See LIGHT, Vol. XIV, pp. 600–602.

RAINES, JOHN, an American lawyer and public man; born in Canandaigua, New York, May 6, 1840. He graduated from the Albany Law School in 1861; served in the armies of the Potomac and North Carolina as captain from 1861 to 1863; was a member of the assembly of the state of New York in 1881, 1882 and 1885; was state senator in 1886, 1887, 1888 and 1889; was president of the board of education of Canandaigua; was elected to Congress in 1889 and re-elected in 1891. He was the author of the Raines Liquor Law; q.v., under LIQUOR LAWS IN THE UNITED STATES, in these Supplements.

RAINES LAW. See LIQUOR LAWS, in these Supplements.

RAINFALL. See METEOROLOGY, Vol. XVI, pp. 132, 133; and in these Supplements.

RAINIER, MOUNT. See UNITED STATES, Vol. XXIII, pp. 846, 848.

RAINY, ROBERT, a Scottish ecclesiastic; born in Glasgow, Jan. 1, 1826, and educated at the university there, graduating in 1843; studied theology at New College from 1844 to 1848; ordained minister of the Free Church in 1851; became professor of church history in New College in 1862, and in 1874 its principal. He was a prominent leader of the Free Church and an advocate of disestablishment. He wrote several theological works; among them, *Three Lectures on the Church of Scotland* (1872); *The Delivery and Development of Christian Doctrine* (1874); *The Bible and Criticism* (1878); and *The Epistle to the Philippians* (1892).

RAINY LAKE, a lake which forms a portion of the boundary line between British North America and the United States. It is situated 160 miles W. of Lake Superior; is 1,160 feet above sea-level, and is about 35 miles long and 5 miles in average breadth. Its surplus waters are carried off to the Lake of the Woods, in a west-northwesterly direction, by the Rainy River, which is about 100 miles in length, and the banks of which are covered with pine forests. It is dotted with numerous small islands, and its waters abound in fish.

RAINY LAKE CITY, a small town on Rainy Lake River, in the extreme northwest portion of Ontario, founded in 1894. In the following two years this place came into notice on account of the reported discovery of gold. So far, no paying ore has been taken from this region, but the excitement has been sufficient to bring many people into the locality, and several small villages and hamlets have sprung up on both the American and Canadian side of Rainy Lake. Population 1900, about 1,000.

RALE, SÉBASTIEN, a French missionary; born in Franche-Comté, in 1657. He became a Jesuit and professor of Greek at Nîmes; went to Canada, arriving at Quebec, Oct. 13, 1689, and was stationed among the Abenaki and the Algonquin Indians, near the Falls of the Chaudière, learning their languages and customs; in 1692, went to Illinois; in 1694, took charge of the Abenaki mission at Norridgewock, on the Kennebec, and built a church. The Indians, incited by Frontenac and the French Jesuits, broke their treaty engagements with the British colonists. The English settlers laid the blame of their troubles with the Indians to Rale, and set a price on his head. They burned his church in 1705, and again in 1722 pillaged his house and carried away his dictionary of the Abenaki language, which they presented to Harvard College, and finally, in a third expedition in 1724, succeeded in killing him. In 1833 a monument was erected to his memory at Norridgewock. His Abenaki dictionary was published in 1833, and a memoir of him appeared in Sparks's *American Biography*.

RALEIGH, capital city of the state of North Carolina, and county seat of Wake County, is situated on the Neuse River, 133 miles N.N.W. of Wilmington and 157 miles by rail S.S.W. of Richmond, Va. The city stands on elevated ground, and is regularly built, having a central Union Square, from which radiate four principal streets, each 99 feet wide. This square contains the state capitol, a large and handsome domed building of granite, which cost over $700,000. There are various other state buildings, including institutions for the blind, the deaf and dumb, and the insane, a penitentiary, the governor's mansion, and a museum of geology. It has also a United States Government building, a county court house, Shaw University (colored), etc., also various manufactories, including iron and car works, and cotton, carriage, and agricultural implement factories. It was settled in 1792, and in 1900 had a population of 13,643. G.J.H.

RALLIDÆ, a family. See RAIL, Vol. XX, pp. 229, 230.

RALSTON, WILLIAM RALSTON SHEDDEN, author; born in England in 1828. After receiving his education he turned his attention to the study of literature, especially that pertaining to the Russian Empire and the Russian people. He became proficient in the use of the Russian language, from which he made and published a number of translations. Besides numerous short stories and sketches published at various times in periodicals he was the author of *Kriloff and His Fables; Liza; Songs of the Russian People; Russian Folk Tales*, etc. He died in England, Aug. 7, 1889. G.J.H.

RAM, MARINE. See NAVY, in these Supplements.

RAMADAN OR RAMAZAN. See FASTING, Vol. IX, p. 44.

RAMAH, an ancient Hebrew stronghold. See SAMUEL, Vol. XXI, pp. 264, 265.

RAMAYANA, an ancient epic poem of India. See SANSKRIT, Vol. XXI, pp. 294–297.

RAMOTH, a Hebrew city of refuge; scene of battle in which King Ahab was killed, and of the anointing of Jehu (1 Kings xxii; 2 Kings ix). See GILEAD, Vol. X, p. 531.

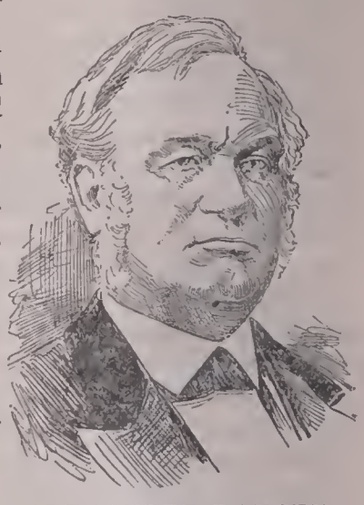
RAMPART. See FORTIFICATION, Vol. IX, p. 371.

RAMSAY, SIR ANDREW CROMBIE, geologist; born in Glasgow, Scotland, Jan. 31, 1814. His attention was early turned to geology, his useful work in which brought him to the attention of Roderick Murchison, the geologist, who secured him a place on the geological survey. For years he worked in Wales, also serving after 1847 as professor of geology at University College, London. He became senior director of the Geological Survey for England and Wales, and in 1871 succeeded Murchison as director-general. On his retirement in 1881 he was knighted. He died at Beaumaris, Dec. 9, 1891. G.J.H.

RAMSAY, WILLIAM, a Scotch chemist; born in Glasgow, Oct. 2, 1852. He received his education at Glasgow University, and later at Tübingen, where he graduated in 1872. He was assistant professor of technical chemistry in Glasgow University until 1880, when he became professor of chemistry at University College, Bristol; became principal in 1881, and professor of chemistry at University College, London, in 1887. He was elected a fellow of the Physical Society (1886), and of the Royal Society (1888), besides being a member of various other bodies. The most important of his works, and the one by which he is best known, is the description of argon, the new element of the atmosphere, which he discovered simultaneously with Lord Rayleigh.

RAMSAY, WILLIAM MITCHELL, educator; born in Glasgow, Scotland, March 15, 1851; was educated at the universities of Aberdeen, Oxford, and Göttingen. In 1880–91, 1898, and 1901–02 he traveled extensively in Asiatic Turkey. He accepted the chair of classical art at Oxford University in 1885, and that of humanity at Aberdeen University in 1886, and came to the United States to lecture at Johns Hopkins University in 1894. His publications include *The Historical Geography of Asia Minor; The Church in the Roman Empire; The Cities and Bishoprics of Phrygia; St. Paul, the Traveler and the Roman Citizen; Impressions of Turkey; Was Christ Born at Bethlehem?; Historical Commentary on Galatians; The Education of Christ*, etc. G.J.H.

RAMSEY, ALEXANDER, statesman, was born near Harrisburg, Penn., on September 8, 1815, and began the practice of law there in 1839. In 1840 he was a campaign speaker for Harrison and Tyler, and in 1843–47 was a Whig representative in Congress from Pennsylvania. In 1849 he was appointed governor of the territory of Minnesota, and served until 1853, was mayor of the city of St. Paul in 1855–57, and was governor of the state of Minnesota from 1859 to 1863. In that capacity he was the first of all state governors to respond to Lincoln's call for troops in 1861. From 1863 to 1875 he was United States Senator from Minnesota, and in 1879–81 he was Secretary of War. He died on April 23, 1903. W.F.J.



ALEXANDER RAMSEY.

RANAVALONA, MANJAKA III, Queen of Madagascar; born in 1861. She was crowned Nov. 2, 1883, succeeding Queen Ranavalona II, by whom she had been appointed as the future queen. Soon after ascending the throne she married Prime Minister Rainilaiarivony. She was deposed in February, 1897, when a new ministry was organized under the French protectorate, which controls the interior administration of the island. On March 11, 1897, she was deported to the Island of Réunian, and in 1899 to Algiers.

RANCAGUA, Chile, the capital of the department of O'Higgins, 40 miles by rail south of Santiago. The city is in the valley of the Rapel River, and was the scene of the siege and battle of October 1 and 2, 1814, when the republican General O'Higgins, was defeated by the royal Spanish troops, but managed to retreat with his shattered forces after the town had been laid in ruins. Population, 7,000. C.L.S.

RANCE, ARMAND JEAN DE. See TRAPPISTS, Vol. XXIII, p. 56.

RANDALL, JAMES RYDER, journalist and poet, was born in Baltimore on January 1, 1839, and was educated at Georgetown College, D. C. He became a journalist and wrote much for the support of the Confederate cause. His stirring lyric, *Maryland, My Maryland!* was one of the most popular of all the war songs of the South. He also wrote *The Sole Entry*, *Arlington*, *There's Life in the Old Land Yet*, *The Battle Cry of the South*, and other poems. After 1861 he made his home in Georgia. W.F.J.

RANDALL, SAMUEL JACKSON, statesman, was born in Philadelphia on October 10, 1828, received an academic education, and entered mercantile life. He became a member of the city council of Philadelphia in 1854, and of the State Senate in 1856. He served in the army in the Civil War. In 1862 he was elected a representative in Congress from a Philadelphia district, as

a Democrat, and was kept in his seat by successive re-elections to the end of his life. He was speaker of the forty-fifth and forty-sixth Congresses, and although he was a protectionist and thus in disagreement with a large share of his party he was for many years the unchallenged Democratic leader of the House and one of the foremost Congressmen of his time. He died on April 12, 1890. W.F.J.

RANDALL MACHINE. See HARVESTING MACHINERY, in these Supplements.

RANDEGGER, CAVALIERE ALBERTO, an Italian composer; born in Trieste, April 13, 1832. He studied under Lafont for the pianoforte and under Ricci for composition; was musical director in theaters at Fiume, Zara, Brescia and Venice until 1854, when he went to London. He became widely known as a composer, conductor and teacher; was appointed teacher of singing at the Royal Academy of Music, London, in 1868; later became director; and in 1892 was made a knight of the Crown of Italy. His best-known works are *Bianca Capello* (1854); a *Funeral Anthem* for the death of the Prince Consort (1862); *The Rival Beauties* (1864); *Fridolin* (1873); and *I Naviganti*.

RANDOLPH, Massachusetts, a town of Norfolk County, in the central-eastern part of the state, thirteen miles south of Boston. It is in the heart of a manufacturing and gardening region, and has extensive boot and shoe factories. It is the seat of a high school and of a public library, and is a favorite place of residence. It is reached by the Old Colony division of the New York, New Haven and Hartford railroad, and had in 1900 a population of 3,993. W.F.J.

RANDOLPH, Vermont, a town and village of Orange County, in the central part of the state, 25 miles south of Montpelier, on the White River and on the Central Vermont railroad. It is in an agricultural and dairy region. Its population in 1900 was 3,141. W.F.J.

RANDOLPH, EDMUND, statesman; was born at Williamsburg, Virginia, on August 10, 1753, was educated at William and Mary College, and became a lawyer. He was mayor of Williamsburg in 1776, helped to prepare the first constitution of Virginia, was the first attorney-general of the state, served in Congress in 1779–82, and was governor of the state in 1786–88. He was a prominent member of the Federal Constitutional Convention, but pursued in it an erratic course. He was attorney-general in Washington's Cabinet in 1789, and succeeded Jefferson as Secretary of State in 1794. In that office, in most trying times, his honor was impugned by Fauchet, the unscrupulous French Minister to America, the rest of the Cabinet turned against him, and he was compelled to resign amid a storm of obloquy. His private estate was confiscated by a decision of the Treasury, and he was recorded as a defaulter to the Government. He retired to Virginia, practiced law and was the author of a few political pamphlets. He died on September 13, 1813. Later researches have largely vindicated his memory and have shown him to have been a pure and able patriot who was unjustly made to suffer for the faults of others. W.F.J.

RANDOLPH, GEORGE WYTHE, soldier, son of Thomas Mann Randolph, was born at Monticello, Va., on March 10, 1818. At the time of John Brown's raid at Harper's Ferry he commanded an artillery company, and at the outbreak of the Civil War he led it into the Confederate service. For gallantry at Big Bethel he was made a brigadier-general. He was one of the peace commissioners appointed to confer with President Lincoln, and was Confederate Secretary of War for a time in 1862, and agent in France in 1863. He died on April 4, 1867. W.F.J.

RANDOLPH, PEYTON, statesman; was born at Williamsburg, Virginia, in 1721, was graduated from William and Mary College, studied law in London, and became King's attorney for Virginia in 1753, in which office he had a bitter controversy with Governor Dinwiddie. In 1766 he became Speaker of the House of Burgesses. At the beginning of the Revolution he was looked to as a leader, he was a close friend of Washington and Jefferson, was president of the first Continental Congress and also began service in the second Congress, but died suddenly of apoplexy on October 22, 1775. W.F.J.

RANDOLPH, THOMAS MANN, statesman, was born at Tuckahoe, Va., on October 1, 1768, and was educated at the University of Edinburgh, Scotland. He married a daughter of Thomas Jefferson, was a representative in Congress in 1803–07, was an officer in the War of 1812, and was governor of Virginia in 1819–21. He died on June 20, 1828, as a result of exposure caused by giving his cloak to a needy beggar and riding home without it. W.F.J.

RANDOLPH–MACON COLLEGE, an educational institution located at Ashland, Virginia, with preparatory schools at Bedford City and Front Royal, and a woman's college at Lynchburg, with the same courses offered at Ashland. The college was founded by the Virginia and Baltimore conferences of the Methodist Episcopal Church in 1832, in Mecklenburg County, but after the war was removed to Ashland. There is an endowment of about $450,000, besides the equipments. This, with all other sources of income, furnishes some $25,000 yearly. There is a library of 15,000 volumes; the faculty in 1907 numbered 16 and the student body about 150. In the girls' school there are 33 teachers and about 385 students.

RANGE–FINDER. Owing to the great cost of manipulating modern guns it becomes essential to make each shot effective, and of late years much study has been given to this subject, and great advances have been made. Two recent devices for range-finding have been invented by Americans—one by Lieutenant Isaac N. Lewis of the army, and another by Lieutenant Bradley A. Fiske of the navy. That of the former is for battery use in coast-defense, and has been adopted by the United States army. This instrument is essentially a depression range-finder, requiring a height of at least thirty feet for effective use, and will give the range up to

eight miles. The instrument affords a rapid mechanical solution of a right-angled triangle, of which the vertical is the height of the instrument above the sea-level, and the base is the range of the object looked at through the telescope. It consists of a cast-iron circular table, upon which is mounted a telescope-holder, or cradle, pivoted in the center, and having the telescope pivoted at the front end of the cradle. The instrument can be manipulated by one person, who can find any range in five seconds. He has only to direct the telescope on the ship's water-line, read the range directly in yards from the range scale, and the direction of the ship from any given base-line from another device. The instrument has automatic corrections for refractions, rise and fall of tides, and curvature of the earth.

The Fiske instrument is not at all complicated, involving only elementary knowledge of mathematics and electricity. It is based on the familiar mathematical proposition that if two angles and one side of a triangle are known, the other two sides of the triangle can easily be found. The Fiske range-finder, however, eliminates all calculations, and finds the range automatically. A base-line fixed once for all on the ship, is the known side of the imaginary triangle. The distance of the object is represented by either of the other two sides. The target, therefore, is at one angle of the imaginary triangle, and at the other angles, at the extremities of the fixed base-line, are placed two spy-glasses, which can be directed upon it. As these spy-glasses are turned into the proper position they move over and touch wires which are bent in the form of arcs. The differences in length of the wires passed over corresponds mathematically to the distance of the object. As this length of wire increases or diminishes, it will offer more or less resistance to an electrical current sent through it. A very simple electrical contrivance, amounting practically to a balance, allows this resistance to be measured and read, not in units of resistance, but in yards. The two spy-glasses being pointed at the target, the observer at each spy-glass has nothing to do but to keep it thus pointed. Elsewhere in the ship, another observer may stand at a telephone, listening to a buzzing sound produced by an electrical device known as a circuit-breaker, and simultaneously moving with one hand a pointer over a graduated scale. The instant the buzzing in the telephone stops, he reads the range denoted by the pointer from the scale, and conveys the information by a simple form of telegraph to the men at the guns.

For coast-defense several improvements have been added to Fiske's instrument. The latest plan is to have the ground over which the battery sweeps delineated on a brass plate, which is fitted on the tripod of one of the instruments. Two pointers sweep over the plate, one of which remains parallel to the telescope overhead and the other is kept parallel to the telescope at the other end of the base-line by means of electrical connections. The brass plate is divided into a number of squares, the sides of which are in proportion to the sides of the squares into which the actual territory is divided. The point of intersection of these arms is the exact location of the target. The distance of the target is found in the same way as on board a vessel. Then the whole is reported to the officer at the battery the location being indicated by the squares.

Another range-finder was patented in 1896 by F. J. B. Codeiro, and is for use by hand. It consists of a telescope at one end of and at right angles to an arm about three feet long. A prism is at the end of the arm and another in front of the glass. These, when moved into the right position, reflect the image into the telescope. By means of a vernier scale one angle is obtained, and the right angle and base being known, the distance can be determined. See also TELEMETER, Vol. XXIII, pp. 136, 137.

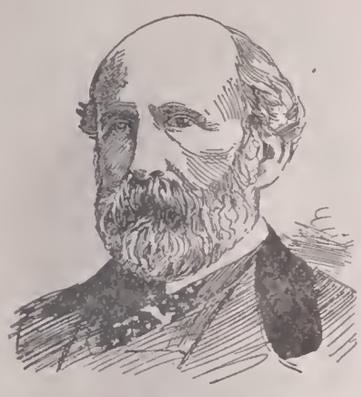
RANIDÆ, the family of true frogs, consisting of about two hundred and fifty species, widely scattered over the world. Some species are aquatic, others arboreal. *Rana*, the typical genus, has over one hundred species. See also FROG, Vol. IX, p. 698.

RANKE, LEOPOLD VON, a German historian; born at Wiehe, Thuringia, Dec. 21, 1795. He studied at Leipsic and became in 1818 a teacher at the gymnasium of Frankfort-on-the-Oder; in 1825 professor extraordinary, in 1834 professor ordinary at Berlin and historiographer of Prussia. In 1867 he was created chancellor of the order *Pour le Mérite*, and on Feb. 13, 1882, the day of his 50th jubilee of having been member of the Academy, a privy councilor. He died May 23, 1886. Already by his first work *Geschichte der Romanischen und Germanischen Völker von 1494–1535* (1824), he, although influenced by historians like Thucydides and Niebuhr, manifested great originality of style and conception, which became still more pronounced by his *Fürsten und Völker in Südeuropa im 16th und 17th Jahrhundert* (1827). It was, however, by his *Die Römischen Päpste, ihre Kirche und ihr Staat im 16th und 17th Jahrhundert* (1834–37), that he excited the admiration of the literary world by the impartiality with which he treated on the historic-political significance of popedom. Of equal worth are *Deutsche Geschichte im Zeitalter der Reformation* (1839–47); *Französische Geschichte im 16th und 17th Jahrhundert* (1852–61); *Englische Geschichte im 16th und 17th Jahrhundert* (1849–63); *Zur Deutschen Geschichte, vom Religions frieden bis gum Dreissigjährigen Kriege* (1868), and *Geschichte Wallensteins* (1869). Among his other works are *12 Bücher Preussischer Geschichte* (1874–79); *Der Ursprung des Siebenjährigen Krieges* (1871); *Historisch-Biographische Studien* (1878). Of his last work, *Weltgeschichte*, begun in 1880, at which he worked incessantly to the very last days of his life, and in which he treated on the antique world in a truly masterly style, he finished the first six

L. VON RANKE.

volumes, the other two were edited by Dove, Wiedemann and Winter. G.A.S.

RANSOM, MATTHEW WHITAKER, an American public man; born in Warren County, North Carolina, Oct. 8, 1826. He was educated at the University of North Carolina, and became a lawyer and planter; was elected attorney-general of North Carolina in 1852, resigned in 1855; a member of the legislature of North Carolina (1858–60); a peace commissioner from North Carolina to the congress of Southern states at Montgomery in 1861; entered the Confederate army, serving as lieut.-colonel, colonel, brig.-general and maj.-general, and surrendered at Appomattox; was in the U.S. Senate from 1872 to 1895; and was then appointed minister to Mexico. He died October 8, 1904.



M. W. RANSOM.

RANTOUL, ROBERT, JR., statesman, was born at Beverley, Mass., on May 13, 1805, and was graduated from Harvard College in 1826. He became a lawyer, and for several years was a member of the Massachusetts legislature, where he advocated the abolition of capital punishment and was the champion of various reforms, especially in the interest of wage-earners. In 1837 he was a member of the state board of education, in 1843 collector of the port of Boston, in 1845 U. S. district attorney, and in 1851 United States Senator to succeed Daniel Webster, who had become Secretary of State. At the end of his senatorial term, which lasted only nine days, he was elected a representative in Congress. He was an outspoken opponent of slavery, and especially of the fugitive slave law. He died suddenly on August 7, 1852. W.F.J.

RANVIER, LOUIS, a French physician; born in Lyons, France, Oct 2, 1835. He was educated at the Paris School of Medicine; became adjunct director of the laboratory of histology, and in 1875 was appointed to the chair of anatomy, especially created for him; became a member of the Academy of Medicine in 1886; of the Academy of Sciences in 1887; and received the decoration of the Legion of Honor in 1878. His works include *Observations Pour Servir à l'Histoire de l'Adénie* (1868); *Manuel d'Histologie Pathologique* (1869–72); *Traité Technique d'Histologie* (1875–88); and *Leçons d'Anatomie Générale sur le Système Musculaire* (1880).

RAPE. See MEDICAL JURISPRUDENCE, Vol. XV, p. 79.

RAPHALL, MORRIS JACOB, clergyman and author, was born in Sweden in September, 1798. In 1812 he went to England, and lived there from 1825 to 1849, being one of the foremost rabbis and writers on Jewish affairs. He was the translator of the Talmud, the works of Maimonides, and other important books. In 1849 he came to America, and in New York became rabbi of one of the chief Jewish congregations. He was the author of *Post-Biblical History of the Jews*, *The Path to Immortality*, *The Bible View of Slavery*, and other works. He died in 1868. W.F.J.

RAPHIDES. See BOTANY, Vol. IV, p. 78.

RAPID CITY, a city and the capital of Pennington County, western South Dakota, 32 miles S.E. of Deadwood, on the Dakota, Wyoming and Missouri River and the Fremont, Elkhorn and Missouri Valley railroads, in the Black Hills. It is in a good grazing region, but is mostly devoted to mining, gold, tin and mica being mined in the vicinity. The mining of tin is being developed rapidly. Rapid City is the seat of the State School of Mines, and has several banks, churches and papers. Population 1890, 2,128; 1900, 1,342.

RAPID-FIRING GUN. See GUNMAKING, in these Supplements.

RAPP, JEAN, COUNT, a French general; born April 27, 1771, at Colmar; died Nov. 8, 1821; entered the service in 1788; in 1800 adjutant to Napoleon; in 1804 brigade-general; 1805, general of a division; 1807–09, governor of Danzig; distinguished himself at Aspern, and in the Russian campaign; in 1817 a peer and a lieutenant-general of cavalry. He wrote *Mémoirs*. G.A.S.

RAPPAHANNOCK, a river of Virginia, formed by the Union of the North Fork and the Rapidan, which rise in the Blue Ridge of the Alleghany Mountains and flow eastwardly to their point of Union, forty miles above Fredericksburg, where the falls afford water-power. The river is navigable from this point southeast to Chesapeake Bay, which it enters by a broad estuary, seventy miles long. On the Rappahannock and the Rapidan occurred the sanguinary battles of Fredericksburg, Chancellorsville and the Wilderness. Length, about 250 miles.

RAPTORES, a name formerly used to indicate an order of birds, members of which are now included in the order *Falconiformes*, especially its sub-order *Accipitres*. The latter include the secretary-bird, the Old World vultures, and the hawks, eagles, and falcons. R.W.C.

RARITAN RIVER, a stream of New Jersey rising in two branches in western Morris County, which flow southward and unite in Somerset County. It flows east into Raritan Bay; is about 70 miles in length, and is navigable for 15 miles, as far as New Brunswick, where it is joined by the Delaware and Raritan canal, which connects with the Delaware below Trenton, forming a short route between New York and Philadelphia.

RASKOLNIKS, a nonconformist sect. See RUSSIA, Vol. XXI, pp. 89, 90.

RASORES. See ORNITHOLOGY, Vol. XVIII, p. 50.

RASP. See FILE, Vol. IX, p. 140.

RASPBERRY. See HORTICULTURE, Vol. XII, p. 286.

RASSAM, HORMUZD, a British archæologist; born in 1826, in Mosul, in northern Mesopotamia. In 1845 he joined Mr. Layard to assist him in his Assyrian researches. When Mr. Layard returned to England in 1847, Mr. Rassam accompanied him to

complete his studies at Oxford, but at the end of 1849 he was sent out by the British Museum authorities to assist Mr. Layard in his second undertaking. Mr. Layard commissioned Mr. Rassam to succeed him. During this expedition Mr. Rassam discovered, in Nineveh, the palace of Sardanapalus. After this he held a political appointment at Aden; was British representative at Muscat in 1861; and sent as ambassador to King Theodore of Abyssinia to secure the release of some British citizens, but was himself imprisoned for two and a half years, when he and the others were released by Sir Robert Napier. Mr. Rassam published a narrative of the *British Mission to Theodore, King of Abyssinia.* In 1876 he was selected by the trustees of the British Museum to conduct the Assyrian explorations. From that time until July, 1882, he conducted the British national archæological researches in Assyria, Armenia and Babylonia. He discovered, among other sites, the great cities of Sippara, or Sepharvaim, and Cuthah, situated in southern Mesopotamia. During the Turko-Russian war he was sent by the British Foreign Office on a special mission to Asia Minor, Armenia and Kurdistan, to inquire into the condition of the different Christian communities who were said to be maltreated by their Moslem fellow-countrymen.

RATIO. See GEOMETRY. Vol. X, pp. 340–349.

RATITÆ. See BIRDS, Vol. III, p. 605.

RATTAN OR RATAN. See CANE, Vol. IV, p. 711.

RAVENNA, a village and the county seat of Portage County, Ohio, in the northeastern part of the state. It lies 32 miles southeast of Cleveland, to which city it is tributary, and is reached by the Cleveland and Pittsburg, the New York, Lake Erie and Western, and the Pittsburg and Western railroads. It is the center of an agricultural and industrial district, and has a multitude of manufacturing establishments, of great variety, including flour, glass, steel and iron, lumber, bricks, leather goods and vehicles. Its population in 1900 was 4,003. W.F.J.

RAVENSTEIN. ERNEST GEORGE, a German geographer and statistician; born in Frankfort-on-the-Main, Dec. 30, 1834. He removed to London in 1852; held a position in the statistical department of the War Office (1855–74); was a member of the councils of the Royal Geographical and Royal Statistical societies; founded and for ten years was president of the German Gymnastic Society. He published the *Russians on the Amur* (1861); *Geography and Statistics of the British Empire* (1862); *London and the British Isles* (1877); *Englisher Sprachführer* (1884); and prepared a great many maps, including *Eastern Equatorial Africa; British East Africa*, and a *Topographical Map of England and Wales* (1898).

RAWDOM-HASTINGS, FRANCIS. See HASTINGS, FRANCIS, Vol. XI, p. 461.

RAWLINS, a city and the county seat of Carbon County, Wyoming, in the central-southern part of that state. It lies in the heart of the vast plain between the Sweetwater and the Medicine Bow Mountains, and is a center of agriculture and stock raising. It has large mining and quarrying interests, and is the seat of the state penitentiary. It is reached by the Union Pacific railroad, which has repair shops there. Its population in 1900 was 2,317. W.F.J.

RAWLINS, JOHN AARON, soldier, was born in Illinois on February 13, 1831, and became a lawyer. In 1857 he was city attorney of Galena, Ill., and in that city became a close friend of U. S. Grant. In 1861 he entered the army as a captain of volunteers, and was a comrade of Grant in all the latter's campaigns, being made his chief of staff in November, 1862. In 1865 he was brevetted major-general for gallant and meritorious services. On March 11, 1869, President Grant appointed him Secretary of War, but he was already stricken with consumption and he died on September 6. of that same year. He was a man of unusual ability, of puritanical morals, of exquisite modesty and simplicity of life, and of a strength of will and determination rivalling Grant's. He was Grant's most confidential and trusted friend, and probably was of great service to him as a counsellor and aid throughout the war. W.F.J.

JOHN A. RAWLINS.

RAWLINSON, GEORGE, historian; born in Chadlington, Oxfordshire, England, November 23, 1812; was graduated at Oxford University with high honors in 1838, and studied theology there in 1841–42. In the latter year he was appointed an instructor at the university, and remained there till he became curate at Merton, Oxford, in 1846. He was a lecturer at Oxford University in 1859, and three years later he accepted the chair of ancient history there. In 1872 Queen Victoria appointed him canon of Canterbury Cathedral. In connection with this office he became rector of All Hallows' Church, London, in 1888. He held both of these appointments till his death. His reputation, however, rests chiefly on his historical achievements. These show accurate and minute research, and have added to the sum of historical knowledge. He also wrote on Biblical criticism and history. In conjunction with his brother, Sir Henry Creswicke Rawlinson, and Sir Gardiner Wilkinson, he wrote *The History of Herodotus: A New Translation* (with notes, appendices, etc.). His other publications include *The Five Great Monarchies of the Ancient Eastern World; The Sixth and Seventh Great Monarchies; A History of Ancient Egypt; A History of Phœnicia; The Origin of Nations; Historical Illustrations of the Old Testament; The Story of Ancient Egypt; A Memoir of Major-General Sir H. C. Rawlinson*, etc. He also contributed articles to Dr. Smith's *History of the Bible.* He died Oct. 6, 1902. G.J.H.

RAWLINSON, SIR HENRY CRESWICKE, Assyriologist; born in Chadlington, Oxfordshire,

England, April 11, 1810, brother of George Rawlinson; was educated in a school at Ealing and then entered the British army and was sent to India in 1827. He served in the Bombay army till 1833. In that year he was ordered to Persia, where he reorganized the troops of the Shah. In 1840 he was appointed British political agent at Kandahar, Afghanistan, and by his rare judgment during the Afghan War he held that city against attacks without and intrigues within. In 1844 he was appointed British consul at Bagdad and in 1851 was promoted consul-general in Turkey. He returned to England in 1855 to accept the office of crown director of the East India Company. He was promoted major-general in 1859, and created a baronet in 1891. Through his investigations of ancient cuneiform inscriptions he became known as the "Father of Assyriology." In 1837–39 he deciphered the entire Behistûn inscription. During the years he stayed at Bagdad he made translations and copies of various ancient manuscripts for the British Museum, and superintended the excavations which that institution had started at Babylon and Nineveh. As a result of these labors he sent to England many cargoes of slabs and other memorials. His publications include *England and Russia in the East*, and the results of his researches on the cuneiform inscriptions. He died in London, March 5, 1895. G.J.H.

RAWLINSON, Sir Robert, sanitary engineer; born in Bristol, England, Feb. 28, 1810. He became an engineer at Liverpool; worked in railway building under Robert Stephenson; was made engineer of the Bridgewater canal in 1844; and devised a plan to supply Liverpool with pure water from Wales in 1847. His career in sanitary engineering began in 1848, as a superintendent inspector under the Public Health Act, in which he established a new and efficient system of main sewering which has been adopted throughout the world. In 1855 he introduced sanitary works for the army hospitals in the Crimea, greatly reducing the death rate. He subsequently built waterworks for Hong Kong and Singapore, and in 1863 established sanitary works throughout the cotton factory districts of England. He was knighted in 1883, and died May 31, 1898. G.J.H.

RAWSON, Sir Rawson William, an English statistician; born in London, Sept. 8, 1812. He was appointed to the Board of Trade in 1829; rose to be first assistant to its chief,—a post which he held till 1842; was then sent to Canada as civil secretary; in 1854 became colonial secretary of the Cape of Good Hope; was later, also, made financial minister, and superintended the taking of the census; in 1864 became governor of the Bahamas and acting governor of Jamaica, was made commander-in-chief of the Windward Islands in 1869, and retired from service in 1875. He was a member of numerous societies, and on his retirement was made a knight commander of St. Michael and St. George. Among his publications are *International Vital Statistics* (1885); *Synopsis of the Tariffs and Trade of the British Empire* (1888–89); and *Gospel Narrative; or, The Life of Jesus Christ* (1892). D., 1901.

RAY, Isaac, physician, was born at Beverley, Mass., on January 16, 1807, studied at Bowdoin College and the Harvard Medical School, and became a physician at Portland, Maine, in 1827. Two years later he removed to Eastport, where he devoted himself to the special study of mental diseases, and wrote a notable work on *Medical Jurisprudence of Insanity*. He became superintendent of the state asylum for the insane at Augusta in 1841 for four years, and then became head of the Butler hospital for the insane at Providence, R. I. In 1866 he removed to Philadelphia, and practiced there until his death; also writing several more books. He died in Philadelphia on March 31, 1881. W.F.J.

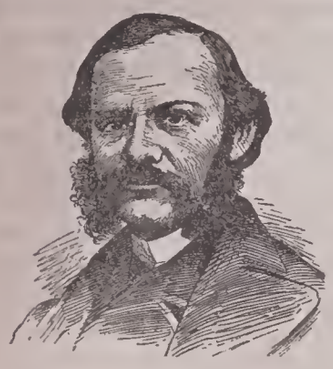
RAY, John, naturalist, was born near Braintree, in Essex, England, in 1627, the son of a blacksmith. He was graduated from Trinity College, Cambridge, and became a fellow there, in 1649, was professor of Greek in 1650, and a tutor in mathematics in 1652. On account of impaired health he then left Cambridge and travelled over England and Wales, studying botany and zoology and other branches of natural history. In 1663–66 he similarly travelled on the continent of Europe, and afterward published an account of his tour. He was elected a fellow of the Royal Society in 1667. He wrote several books which Cuvier regarded as "the foundation of modern zoology." He died in 1704. W.F.J.

RAYLEIGH, John William Strutt, Lord, physicist; born Nov. 12, 1842. He graduated at Trinity College, Cambridge, in 1865, became third Baron Rayleigh in 1873, and was professor of experimental physics in Cambridge University in 1879–84. In 1884 he was president of the British Association, and from 1887 to 1896 was secretary of the Royal Society. In 1888 he succeeded Tyndall as professor of natural philosophy in the Royal Institution, which chair he still retains. Since 1896 he has been scientific adviser to Trinity House, the British lighthouse board. Lord Rayleigh is regarded as one of the greatest of living physicists, his researches being largely in the field of electrical standards and physical optics, while the results of his important studies in acoustics are given in his work *The Theory of Sound*. He also edited Clerk Maxwell's *Theory of Heat*. In 1894, working in association with Prof. William Ramsay, he discovered a new gaseous element, which constituted about one per cent. of the atmosphere, and to which they gave the name of "argon." For this signal discovery they were awarded the $10,000 Hodgkins prize for the most important discovery concerning the atmosphere, and the

LORD RAYLEIGH.

Columbia College Barnard medal for meritorious service to science. Lord Rayleigh is a member of several American societies and of the French Institute. G.J.H.

RAYMOND, Henry Jarvis, journalist, was born at Lima, N. Y., on January 24, 1820, and was graduated from the University of Vermont in 1840. He then studied law in New York, and at the same time began writing for Horace Greeley's paper, the *New Yorker*. When Greeley founded the *Tribune*, in April, 1841, Raymond was engaged as a member of its staff, and showed himself an exceptionally competent journalist. Two years later he was employed by the *Courier and Enquirer*, and remained with it until 1851, when he founded and became editor of the New York *Times*. He was a member of the legislature in 1850–51 and speaker of the assembly in the latter year; and lieutenant-governor in 1855–57. He was an influential leader of the Republican party, and was the author of several books of political history. He died in New York on June 18, 1869. W.F.J.



H. J. RAYMOND.

RAYMOND, John T., an actor. See O'Brien, John, in these Supplements.

RAZOR-CLAM, the popular name of a bivalve mollusk of the family *Solenidæ*. The long and narrow shells suggested the name. The old typical genus *Solen* has been divided into the genus *Solen*, which includes the straight shells, and *Ensis*, which contains the curved shells. *Ensis Americana* is found on the sandy shores of the Atlantic coast of the United States. It burrows with great rapidity, and is not easily captured.

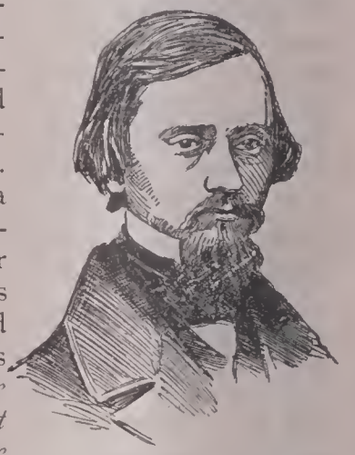
READ, George, jurist and revolutionary patriot, was born in Maryland in 1734, was admitted to the bar at the age of nineteen years, and began legal practice in Delaware. In 1763 he was appointed attorney-general for Delaware, and in 1774 he was elected to Congress and remained a member of that body during most of the revolutionary period. He signed the Declaration of Independence, was president of the first constitutional convention in Delaware, became U. S. admiralty judge in 1782, was the first U. S. Senator chosen in Delaware, and in 1793 became chief justice of the state of Delaware, filling that place until his death in 1798. W.F.J.

READ, John Meredith, diplomat, was born in Philadelphia, on February 21, 1837, a grandson of George Read (q. v.). He was graduated from Brown University in 1858 and afterward studied international law in Europe. He took an active interest in politics as a Republican as early as 1856, and in 1860 was made adjutant-general of the state of New York, with the rank of brigadier-general. For his efficiency in the military service of the state during the war he won the thanks of the National government. In 1869 he was appointed consul-general at Paris, and during the Franco-German War of 1870–71 was entrusted with the protection of German citizens in France and was practically German consul-general. In November, 1873, he was appointed American minister to Greece, and filled that place for more than six years, rendering invaluable services during the Russo-Turkish War and in the governmental crisis in Greece in 1878. During his diplomatic career he made a most interesting collection of diplomatic and historical documents, letters, etc. He died in Paris on December 27, 1896. W.F.J.

READ, Opie, an American author, born in Nashville, Tennessee, Dec. 22, 1852; was educated at Neophogen College, Gallatin, Tennessee. Took up newspaper work upon graduation, and followed his profession in Little Rock, Louisville, Nashville and Cleveland. Finally started *The Arkansaw Traveler*, a weekly paper of humor and literature, at Little Rock, Arkansas, which had quite a success until it was removed to Chicago and he resigned from its editorship, when it was discontinued. Among his stories of Southern life are *Len Gansett* (1888); *A Kentucky Colonel* (1890), which was dramatized, and made a decided hit on the stage, and which has been republished in England, where it has been received favorably; *Emmett Bonlore* (1891); *A Tennessee Judge* (1893); *The Wives of the Prophet* (1894); and *The Jucklins* (1896).

OPIE READ.

READ, Thomas Buchanan, painter and poet, was born in Chester County, Penn., on March 12, 1822, studied sculpture and painting in Cincinnati, and in 1841 removed to New York, and practiced portrait painting there and in Boston. He settled in Philadelphia in 1846, went to Europe in 1850, and after 1853 spent most of his time in Florence and Rome. Of his paintings the best known are *The Lost Pleiad*, *The Spirit of the Waterfall*, *The Star of Bethlehem*, *Cleopatra and Her Barge*, and portraits of Mrs. Browning and Longfellow. His reputation rests chiefly, however, upon his poems, and especially upon a few of his shorter and lyrical poems. His *Wagoner of the Alleghanies*, *The New Pastoral*, and other long and elaborate poems, are uneven in quality, but contain some charming passages and on the whole are inspired with true poetic feeling and a particularly pure and healthful tone. His *Sheridan's Ride* is one of the most stirring of



T. BUCHANAN READ.

American patriotic ballads, his *Drifting* is a lyrical gem, and *The Closing Scene* is one of the noblest elegiac poems in American literature. He died of pneumonia in New York, on May 11, 1872. W.F.J.

READE, William Winwood, traveler; born in Ipsden House, Oxfordshire, England, Jan. 30, 1838; nephew of Charles Reade, the novelist. He was educated at Oxford, and, instigated in 1861 by Du Chaillu's story of the gorilla, set out for Africa and ascended the Gaboon, to observe the animal in its native haunts. He afterward traveled in Angola, and in 1869 and later sought without success the sources to the Niger. In 1873 he returned to Africa as *Times* correspondent during the Ashantee War. He died April 24, 1875. G.J.H.

READING, Massachusetts, a town of Middlesex County, in the northeastern part of the state, about twelve miles north of Boston, on the Boston and Maine railroad. It is a considerable industrial center, its manufactures including leather, rubber and metal goods. Its population in 1900 was 4,969. W.F.J.

READING. Pennsylvania, an important city and the county seat of Berks County, in the southeastern part of the state. (For general description, see Reading, Vol. XX, p. 317.) Its beautiful situation in the valley of the Schuylkill River, its proximity to Philadelphia (47 miles), and its exceptional railroad and canal transportation facilities, together with its strategic position at the gateway of the great anthracite coal region, have combined to make Reading grow rapidly in population, industries and wealth. The neighboring hills and mountains have grown in favor as places of summer resort, fine parks have been laid out, and the city has been quick to introduce electric lighting and traction service and other modern improvements of urban life. There are several high schools and public libraries. In 1900 there were 435 manufacturing establishments, with a total capital of more than $14,000,000, and with 13,000 employees. The population has grown from 58,661 in 1890 to 78,961 in 1900. W.F.J.

REAGAN, John Henninger, statesman, was born in Sevier County, Tenn., on October 8, 1818, spent his youth on a farm, and was educated in the common schools and, for one year, in college at Marysville, Tenn. He then became a pioneer in the struggling republic of Texas, served in a Texan Indian war, was a deputy surveyor of public lands, a justice of the peace and an officer of militia. He became a probate judge in 1847, member of the Texas legislature in 1847, a judge in Texas in 1852–57, and a representative in Congress in 1857–61. At the outbreak of the Civil War he identified himself with the Confederacy, was a member of its provisional Congress in 1861, postmaster-general of the Confederacy in 1861–65, and secretary of the treasury in 1865. He was a representative in Congress again in 1875–87, and was the author of the Interstate Commerce bill which formed the basis of the present law. He was a Senator from Texas from 1887 to 1891, and in the latter year became chairman of the Texas State Railroad Commission. Died at Palestine, Texas, March 6, 1905. W.F.J.

J. H. REAGAN.

REALGAR. See Arsenic, Vol. II, p. 555.

REALISM, in philosophy. See Hamilton, Vol. XI, p. 373; Schopenhauer, Vol. XXI, p. 479; and *Universals*, under Scholasticism, Vol. XXI, pp. 436, et seq.

REALISM is a name for the search for the actual, especially in the domain of philosophy and art. It might be said, by artificial thinkers, that all scientific investigations are a search for the actual, and hence realistic, but from a metaphysical point of view dealing with external phenomena may be very far from pursuit of reality. Without a metaphysic, the scientist is stranded inevitably upon a collection of unrelated observations, which is the precise difficulty Hume found in his speculations. To such a mind, cause and effect are reduced to a mere sequence in time, and the process of generalizing, or the use of hypothesis, has small value. Thus the modern physicist, from the doctrine of the correlation of forces, is driven to educe the principle that force is a fixed and eternal quantity; the chemist holds that there are indestructible atoms, the number of which is never increased or diminished; the biologist believes that life proceeds from life, and that species are developed by natural selection. These hypotheses, and they are no more, fruitful as they have been in illumining the whole field of science, are the contribution of the human mind to the study of phenomena. The mind is philosophical, and because it is so, men come to a belief in natural law; and that is a most imperative necessity of thinking. The metaphysician will say that such laws are realities, and the scientist also assumes their inexorable and eternal nature. From both sides comes a common purpose to reach out for the absolute unity in which all phenomena, psychological and external, are related. If the scientist declares himself an agnostic, he simply means that his instruments of research and thought are inadequate to go beyond phenomena. These phenomena certain schools of philosophy call evanescent, and only the partial embodiment of persisting thought-realities. Yet the student of nature has a large number of hypotheses and mathematical relations, revealed to him by reflection, that are very dominant and actual in the world. In finding these laws of relation, he, too, is a realist of the most emphatic sort. To him they are the realest of things. Still, we do not apply the term *realism* to investigations concerned wholly with facts of nature, but only to those studies in which idealism and realism are relative terms. See Idealism, in these Supplements.

Art. The same spirit of reflection and criticism which prevails in other matters in modern times has had its influence on literary, graphic and plastic arts.

It demands that imagination, with its romance and exuberance, give place to the representation of things as they are. There is no exact significance in the term *realism*, and according as they restrict it to faithful portraiture of vulgar things, or expand it to embrace faithful depicting of excellencies, the critics will condemn or applaud the school. It is a far call from Holman Hunt's *Shadow of Death* or *Flight into Egypt* to Bonnat's *Christ on the Cross*, and yet both men are realistic, Hunt having gone to the Orient to paint in his accessories of Christ in the carpenter's shop and the flight, while Bonnat chose to exhibit the anatomical contortions of pain. In literature, William D. Howells and Émile Zola are at the antipodes of realistic fiction, but, aside from quality of diction, the substantial difference of the men is in the choice of subjects.

Realism in Europe is supposed to be a peculiarly French production, because there the school has had the extremest development and the most advocates. Yet Adolfo Bartoli of Florence places its literary origin with Manzoni and Leopardi. A discussion of this point will be found under ITALY, Vol. XIII, p. 525. Tolstoi must be classed among the realists.

It by no means follows that all realists work on the plane of Zola's *L'Assommoir*. There is too much reason to regret that realism in art should be identified with the hard characters of *La Comédie Humaine*, or the procession of vulgar people in the *Rougon-Macquart* series. Flaubert and Couture are not the only, or the best, examples of this school, although an abundance of tales and pictures given to salacious, sordid and brutal themes have allowed the impression to go abroad that they alone are realistic. Realism has little to do with the choice of subjects, but with their manner of treatment when selected. The characteristics of it are a detailed exploitation of character; personalities in which the good and bad mingle in a natural way, none impeccable, but some, alas, without the luster of virtue; indifference to plot, sometimes neglect of it; no poetic rewards and retributions, but simply the unsolved common enigma of life portrayed. The artists deal with life as it is; romance recedes; the imagination is chained to experience, the mind to observation. But, clearly, all these qualities may inhere in a portraiture of estimable characters as well as in a tale of grisettes and men of the town. In art, whether literary or graphic, there will always remain some idealism. It is inseparable from personality. In its higher aspiration, realism is the effort to find art in natural and familiar things. It is often said that mechanical invention and the exactitudes of modern research are fatal to the artistic spirit,—that locomotives and telegraphs are not picturesque; that chemistry and electricity have inspired no epic nor lyric. Yet the wonders of invention and research do excite the imagination, if no true art has yet been found for the expression of that excitement. If art is suffering from a degeneration because modern emotions of wonder have found no imaginative forms of expression, it may be the function of realism to work out this problem of real life, until new art-forms are found that are pure and noble, even to the standards of the old romance.

Philosophy. Realism in metaphysic did not differ from the idealism of the Greek or neo-Platonic philosophers. It was simply the assertion that ideas were actual entities, and the prototypes of the phenomenal. It came into marked prominence among the schoolmen in opposition to nominalism. Nominalism asserted that existence was predicable only of individuals or particulars. To this the more orthodox schoolmen objected, that individuals were only parts of a process, and that taken by themselves they left particulars unrelated. They also thought it a theory destructive of personal identity, and hence of all philosophy, as well as of all theistic religion. Among the realists of mediævalism were some of the greatest theologians of the church, as Erigena, Anselm, Aquinas and Scotus. They held that particular things were only transitory, constantly giving way to similar successors; that beneath this pageant of nature was a persistent reality, the idea, or the universal, by which the phenomenal could be classified and related. Their assertion of the entity of universals was scholastic realism. This doctrine carried with it, in their estimation, the continuity of the soul, its responsibility and immortality, and the existence of God.

Since Sir William Hamilton's doctrine concerning the validity of perceptions was published the followers of the Scotch, or common sense, school call their philosophy "realism." Its last exponent, Dr. James McCosh, in 1887 restated its position in a treatise entitled *Realistic Philosophy Defended.* This is another sense of the term,—one which is not concerned primarily with universal terms. This school of philosophy assumes a like validity for sense-perceptions, as for other affirmations of consciousness. It claims as a postulate of common sense, that there is an external reality answering to the perception of it; that the perception of an external object is as unmediated as the perception of an idea. Both stand alike for realities. For Hamilton's doctrine, see Vol. XI, p. 373.

RECAPITULATION THEORY. See EMBRYOLOGY, in these Supplements.

RECAPTURE. See PRIZE, Vol. XIX, p. 786.

RECEIPT. See PAYMENT, Vol. XVIII, pp. 451, 452.

RECEIVER, as the term is used in law, is a person appointed by a court having chancery powers to take possession of the property of another, or a portion thereof, and receive the rents, profits and issues arising therefrom. A receiver is a ministerial officer of the court, with only such powers as the court confers upon him by order. He should be

disinterested in the controversy which has resulted in his appointment. Hence, generally, courts will not appoint attorneys interested in the suit, or officers of a corporation when the corporation property is to be turned over to a receiver, although these questions are left largely to the judgment and discretion of the court. A receiver is appointed only in cases where it appears to the court necessary for the protection of the property interests of some of the parties. Receivers frequently are appointed to assume control of real estate and collect the rents and profits thereof, when such real estate is the subject of litigation, as in the case of foreclosure of mortgages and other proceedings in equity. The most important use of receivers in the United States is in the case of financial difficulties arising in connection with business enterprises, in which, upon the application of creditors, or some one interested in the business, the court appoints a receiver to take charge of the business, and either continue its operation for the benefit of all parties in interest, or close it out and apply the proceeds in payment of the indebtedness. The right to appoint receivers for insolvent concerns, or those financially embarrassed, usually is provided by statute; and while the circumstances justifying such action, and the method for procuring the appointment of receivers, are substantially uniform, yet many minor differences are found among the various states. It is a general rule that a receiver will be appointed to take charge of the assets of a corporation if the officers are mismanaging its affairs or misappropriating its funds so as to endanger or impair the rights of creditors or stockholders. The disposition of the assets of a corporation for which a receiver has been appointed will depend upon the circumstances surrounding the case and the judgment of the court as to the best method of protecting the rights of interested parties. In the case of railroads and other large corporations, where interests are large and involved, and a great number of persons are interested, a receiver will frequently be permitted to conduct the business under direction of the court until all rights are determined fully and its affairs adjusted and placed upon a sound basis. In case of small corporations and partnerships, receivers are not often appointed, except in case of insolvency, in which case the receiver generally is ordered to dispose of the assets at the earliest time possible; and if he continues the business, it is usually only temporarily, until it can be closed out to the advantage of the parties in interest.

In such cases the appointment of a receiver is an insolvency proceeding enforced by the court. The distribution and administration of the assets by a receiver is governed by about the same rules as those which prevail in case of a voluntary assignment for the benefit of creditors to a person named by the debtor as assignee, the chief difference being that in one case the court compels the assignment, and in the other it is the voluntary act of the debtor. The pay of a receiver is usually left to the discretion of the court, and is allowed out of the assets of the estate. The remedy by procuring the appointment of a receiver of an insolvent concern is in very general use, and results equitably to all parties. The proceeds, in such cases, are distributed *pro rata* among creditors, who generally are required to file verified statements of their claims with the receiver before being entitled to share in the distribution. The receiver or other creditors may file objections to these claims and require proof to be made thereof.

RECIPROCITY, in a political sense, means the interchange of commodities between the subjects of different governments without levying export or import duties thereon, free entrance being permitted by each government in consideration of like privileges extended by the other. Reciprocity is brought about by means of treaties. Such treaties may provide for entire freedom of trade between the citizens of the two countries, or they may provide that such free interchange shall apply only to specified commodities. The principle of reciprocity of trade has frequently been recognized in Europe since the fourteenth century, more especially between the free cities. From 1854 to 1866, under treaty between the United States and Great Britain, reciprocity was established between the United States and Canada as to certain commodities, mostly raw material or half-manufactured products. This treaty was terminated finally by notice from the United States to Great Britain, as provided in the treaty. In 1876 reciprocity was established between the United States and Hawaii. The system of reciprocity was not of great importance in the United States until the conference, brought about by Mr. Blaine, as the Secretary of State, between the states of the two American continents, which assembled at Washington, Oct. 2, 1889. This conference was assembled for the purpose of discussing means for better commercial relations between American nations. As a result of the exchange of views, Congress authorized the President to enter into negotiations for the establishment of reciprocity by treaty as to certain commodities. For the history of these measures, see UNITED STATES, in these Supplements.

RECITATIVE AND LYRICAL DRAMA. See MUSIC, Vol. XVII. pp. 93, 94.

RECLUS, JACQUES ELISÉE, geographer and scientist, member of a family of marked ability and achievements, was born in La Gironde, France, on March 15, 1830, and was educated in Rhenish Prussia. His political opinions being strongly democratic, he found it expedient to leave France after Louis Napoleon's coup d'état, and thereafter spent several years in travel in Great Britain, and North, Central and South America. Upon his return to France he wrote elaborate series of articles on his travels and observations, chiefly on the social and political conditions of the countries concerned, which were published in the *Revue des Deux Monds* and other periodicals. He also wrote *Les Villes d'Hiver de la Méditerranée et les Alpes Maritimes*, a *Dictionnaire des Communes de la France*, and *La Terre*, the last named a monumental work which has been translated into English and has passed through many editions. During the siege of Paris in 1870–71 he served in the National Guard, and also in the balloon corps organized by M. Nadar. He opposed

the Versailles government and threw in his lot with the Commune, with the result that he was condemned to transportation to a penal colony for life. Upon the petition of scientific men in many lands this sentence was commuted to one of simple exile, whereupon he went to Italy, and thence to Clarens, in Switzerland, where he remained until full amnesty for all the surviving Communists was granted. In 1882 he gave a further demonstration of his radical principles by giving his two daughters in marriage without either a religious or a civil ceremony. He and his friend Prince Kropotkin were charged with Anarchistic conspiracies, but he escaped arrest by retiring again into Switzerland, in 1883. In 1892 he was appointed professor of comparative geography in the University of Brussels. In addition to the works named he wrote *Geographie Universelle*, *Histoire d'un Ruisseau*, *Histoire d'une Montagne; Evolution, Revolution, et l'Ideal Anarchique*, etc. He died July 4, 1905. W F.J.

RECLUS, Elie Armand Ebenezer, naval commander and explorer, brother of J. E. Reclus, was born at Orthez, France, on March 13, 1843, entered the French navy in 1860, and was associated with Bonaparte-Wyse in making explorations and surveys for the Panama canal under the direction of De Lesseps. He wrote a *Report* and several other publications upon the subject of the Isthmian canal, and the article on Ethnography, Vol. VIII, in this Encyclopædia.

W.F.J.

RECLUS, Michel Élie, theologian and scholar, brother of J. E. Reclus, was born in La Gironde on June 16, 1827, was educated at a school of the Moravian Brethren in Rhenish Prussia, and studied theology in France and Switzerland. He went into exile with his brother at the coup d'état of Louis Napoleon, but returned to France four years later and was identified with various co-operative enterprises. Because of his participation in the Commune in 1871 he was condemned to penal servitude, but escaped to Switzerland. He collaborated with his brother upon the *Dictionnaire de Communes de France*, and wrote much for various journals and reviews.

W.F.J.

RECLUS, Onésime, soldier and author, brother of J. E. Reclus, was born at Orthez, in the Basses-Pyrénées, France, in 1837, and was a soldier in Algiers. He studied in Germany and travelled extensively in Europe and Africa. He was one of the editors of the *Tour du Monde* and wrote *La France et Ses Colonies*, *La Terre à vol d'Oiseau*, and other works. W.F.J.

RECLUS, Paul, physician, brother of J. E. Reclus, was born at Orthez, France, in 1847, studied at Nîmes and Paris, and was graduated in medicine in 1876. He became a hospital surgeon, and won high rank for his skill in operations. He has written *Clinique et Critique Chirurgicales*, *Cliniques Chirurgicales de l'Hôtel Dieu*, and other professional works. W.F.J.

RECLUS, Sœurs. In addition to the five Reclus brothers mentioned, the Reclus family comprised three sisters, who became expert linguists and were the authors of a number of translations and also of original works, the latter comprising fiction, travels, and science. W.F.J.

RECOLLETS, a Roman Catholic order. See Franciscans, Vol. IX, p. 615.

RECONNAISSANCE, GEOGRAPHICAL. See Surveying, Vol. XXII, pp. 748–50.

RECONSTRUCTION. When the Confederate armies surrendered to the Union armies in 1865, the Confederate States passed under the control of the military power of the United States. But they were not members of the Union then: they were conquered territories. They had declared themselves out of the Union by their several acts of secession, and after their conquest were to be dealt with as in the case of other United States territories. But President Andrew Johnson maintained that the Southern states, after laying down their arms, were in the same constitutional relations to the United States government as before their secession. In pursuance of this view he appointed "provisional governors" for these states, although the laws of the United States gave him no right to appoint such officers. Only Congress can create offices in United States territories.

The provisional governors called upon the people of their states to send delegates to enact constitutions for such states. Conventions were held, and the ordinances of secession were repealed and slavery abolished; state constitutions were framed, and in some cases submitted to the people for ratification. In other cases the constitutions took effect from the authority of the conventions alone.

In all cases the colored population had no voice in framing these constitutions, nor in electing the governors, state legislatures, and other officers that were elected under these constitutions.

Congress, in its turn, refused to admit the representatives from the Southern states, and in effect declared that the method of reconstruction which had originated with the President was inconsistent with the United States Constitution. By adopting the XIVth Amendment to the constitution, on June 16, 1866, Congress declared as citizens all persons born or naturalized in the United States, and prohibited the states from depriving any person of life, liberty or property without due process of law, or denying to any person within their jurisdiction the equal protection of the laws. It declared that representatives should be apportioned by counting the whole number of persons in each state, excluding Indians not taxed. It provided that where the right to vote for any office of the United States or a state was denied to any male inhabitant, except for participation in rebellion or other crime, the basis of representation should be reduced in proportion to the number of such excluded citizens to the whole number of male citizens of 21 years of age in such state. It declared that no person shall be a Senator or Representative in Congress, or elector of President or Vice-Presi-

dent, or hold any office, civil or military, under the United States, or under any state, who having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any state legislature, or as an executive or judicial officer of any state, to support the constitution of the United States, shall have engaged in insurrection or rebellion against the same or given aid and comfort to the enemies thereof. It also validated the public debt of the United States and excluded the payment of claims on account of the rebellion or for the emancipation of slaves.

This amendment was promptly rejected by Georgia and North and South Carolina, and ratification was withheld in all other states which had participated in the rebellion, except Tennessee, which promptly ratified it. As Tennessee by its ratification of the XIVth Amendment had virtually accepted the terms of pacification and reconstruction tendered by Congress, this state was, by a resolution of Congress on July 24, 1866, admitted to its former place in the Union and to representation in Congress. By this act Congress had definitely fixed the terms under which the Southern states should be admitted to their full privileges under the United States Constitution. It also withdrew from the President the power conferred upon him in 1862 to grant pardon and amnesty to persons who had participated in the Rebellion. By act of March 23, 1867, Congress declared that no legal governments existed in Virginia, North and South Carolina, Georgia, Mississippi, Alabama, Louisiana, Florida, Texas, and Arkansas. It divided these states into military districts, and placed them under military officers. Military courts were authorized, and all interference by state authority was declared null and void. Authority was conferred upon the enumerated states to form constitutions and choose senators and representatives in Congress; and it was declared that such states should be readmitted to the Union, and their senators and representatives to seats in Congress, when certain conditions should be complied with. These conditions were as follows: The constitution should conform to the Constitution of the United States; it should be framed by delegates chosen by a majority of the votes of the people of the states having the electoral qualifications prescribed by that act; it should be ratified by the same authority; it should be approved by Congress; that no person excluded from office by Amendment XIV should be eligible as member of the convention to form such constitution or vote for the same, or hold office thereunder; that such state should ratify Amendment XIV; that the admission of the state and of its senators and representatives to seats in Congress should take effect when that amendment should be ratified, and become part of the Constitution of the United States. The qualifications of voters prescribed in the act were, that all male citizens of 21 years of age and upward, of whatever color or previous condition, who had resided one year in the state, should be entitled to vote, except where disqualified for participation in rebellion or for felony at common law. The act further declared all civil authority within the state prior to admission, provisional and subject to the military authority.

By the act just mentioned, Virginia constituted the first military district, North and South Carolina the second, Georgia, Alabama and Florida the third, Mississippi and Arkansas the fourth, and Louisiana and Texas the fifth military district. The President assigned to the command of the respective military districts Maj.-Gen. J. M. Schofield to the first, Maj.-Gen. D. E. Sickles to the second, Maj.-Gen. G. H. Thomas to the third, Maj.-Gen. E. O. C. Ord to the fourth, and Maj.-Gen. P. H. Sheridan to the fifth. Major-General Thomas was at his own request, on the 15th of March, 1867, relieved from the command of the third military district and Maj.-Gen. John Pope assigned to that command.

On March 23d and July 19th, 1867, Congress passed the so-called "Reconstruction Acts." The first of these acts was a modification of the previous act providing for government in the South.

It provided for a registration to be made in each of the states there enumerated under the authority of the military officers assigned to them, which should include the emancipated slaves with all other classes, excepting only such persons as had been disfranchised by previous acts. As the exact bearing of this act upon disfranchisements on the ground of aiding in the rebellion was in doubt, the second act of reconstruction was passed to remove such doubt. The persons excluded for participating in the rebellion were declared to be persons who, having been members of the legislatures or of the executive or judiciary of any of these states, had engaged in the rebellion, whether such complicity arose while holding such offices or at a later time.

Under these Reconstruction Acts the qualified voters were registered; elections were held for the choice of delegates to conventions for framing state constitutions; such constitutions were adopted and submitted to the people for ratification. The state offices were filled by election; the legislatures were convened and the state governments were placed in operation. The new state governments promptly adopted the XIVth Amendment, and the respective states were at once admitted to representation in Congress. The commands of the military districts were one after another withdrawn from the Southern states. In 1870 the last ones of these states were readmitted into the Union. After all the states were rehabilitated, Congress was willing and ready to grant an amnesty to those persons who had been disfranchised by the Reconstruction Acts. See also UNITED STATES, Vol. XXIII, pp. 819–834.

RECORDING ACTS. In the United States, statutes have been enacted in all of the states requiring that certain instruments be recorded in public records kept for that purpose, in order to give them effect against persons who have no

knowledge of their existence. These records are provided with indexes, and are open to public examination, so that any person interested may learn of the existence of the instruments recorded. It is generally necessary to copy the entire instrument in the record, so that the public may have notice of its contents. The whole system of land-titles throughout the United States has for many years been the subject of registration, and it is the rule that a conveyance not placed upon record will not have effect as against a subsequent purchase without notice of such conveyance. This system, therefore, renders it imperative that conveyances be placed upon record, as otherwise they may be defeated by subsequent deeds. The principle of the system of registration applies not alone to conveyances of land-titles, but has been extended and enlarged so that now in many states it includes instruments which relate to nearly every class of property. Varying in different states, the recording acts usually include, besides conveyances of land or interests therein, such instruments and claims as powers of attorney, bills of sale, chattel mortgages, town plats, mechanics' liens, homestead claims, and numerous other instruments. These laws have been instrumental in greatly decreasing the acts of fraud made possible by secret conveyances and liens, by requiring such instruments to be placed upon the public records as notice to those who may be interested. See also REGISTRATION, Vol. XX, p. 354; and TORRENS LAND-TITLE SYSTEM, in these Supplements.

RECOUPMENT, the reduction of a demand by the act of the defendant, by setting up in the same action his claim against the plaintiff for damages, growing out of the fact that the plaintiff has not fully complied with the obligations of the contract upon which he sues, or has failed to perform some duty which the law imposes upon him in the execution of the contract. Recoupment originated in the common law, and became useful to prevent circuity of action. Recoupment differs from set-off, in that the damage claimed must arise out of the same transaction upon which the suit is brought. The claim may be for unliquidated damages, and the defendant cannot recover judgment for any excess in his claim above the plaintiff's demand. The reverse is true as to set-off. Among the claims for which the defendant is entitled to recoup against the plaintiff's demand are for breach of warranty, fraud, failure of consideration, failure to deliver part of goods sold, for neglect of duty by attorney, for failure of landlord to repair, for defective performance of contract and for damage to goods by common carrier. The right to recoup for damages as to the claims above specified and many other similar claims as against the plaintiff's suit upon the cause of action out of which the defendant's claim arose, is accorded in almost all, if not all, of the states of the United States. In many states, however, the method to be used in recoupment is prescribed by statute; but, as a rule, the principles of the common law prevail as to the right to recoup. As a general rule, it is necessary for the defendant to set up his claim for recoupment by way of a plea or notice to the plaintiff; but it has been held that when the claim for recoupment is large enough to extinguish the plaintiff's demand, it may be shown under the general issue. See SET-OFF, in these Supplements.

RECOVERY, COMMON. See FINE, Vol. IX, p. 169.

RECTOR. The many religious guilds that flourished during the middle ages and a great many universities were presided over by an officer whose title was rector. In the universities he was *rector scholarum*, while in the guilds he was *rector societatum*. In many universities in Scotland, France, Germany, and, in a few instances, in the United States in academies, the head of the institution is called rector, as are also the heads of Exeter and Lincoln colleges, Oxford. In the United States the title is used for a Roman Catholic clergyman in charge of a school or community, or in control of a congregation. In general, the head of a religious house in the Roman Catholic Church is termed a rector, and among the Jesuits the title applies to the head of a house which is also a college or seminary. In the Episcopal Church the rector is head of an incorporated parish. See also PARISH, Vol. XVIII, p. 301.

RECTUM, DISEASES OF. See DIGESTIVE ORGANS, Vol. VII, p. 198.

RED BANK, a beautiful suburban residence town and summer resort in Monmouth County, New Jersey, twenty-five miles south of New York. It lies on the Shrewsbury River, which is there navigable for large vessels, is surrounded by a fine farming region, and has a considerable trade in fish, oysters, fruit and vegetables. It is reached by the New York and Long Branch railroad and by direct steamers from New York city, and had in 1900 a population of 5,428. W.F.J.

RED-BIRD, a name often applied to the cardinal or Virginian grosbeak (*Cardinalis virginianus*). The male bird is brilliantly colored with red. See also GROSBEAK, Vol. XI, p. 186.

RED BLUFF, a city and the county seat of Tehama County, California, in the north-central part of the state. It lies on the west side of the Sacramento River, and east of the Shasta range of mountains, and is about 80 miles south of Mount Shasta and 170 miles north of San Francisco. It has some manufacturing industries, and is the center of a large trade in fruit, lumber, grain and cattle. It is reached by the Southern Pacific railroad and by boats on the river. Its population in 1900 was 2,750. W.F.J.

REDBUD TREE (*Cercus Canadensis*), a hardy ornamental deciduous tree of the order *Leguminosæ*. When the tree has arrived at full size (12 to 20 feet high) the branches are thickly beset with red flowers, and the singular shape of the leaves, which appear after the flowers, makes a very agreeable variety in summer, so that the trees deserve a place in every garden. W.R.B.

RED CLOUD, a city and the county seat of Webster County, Nebraska, in the "southern

tier" of the state. It lies on the north side of the Republican River, 160 miles southwest of Omaha, and is reached by the Burlington and Missouri River railroad in Nebraska. It is in an agricultural region. Its population in 1900 was 1,554. W.F.J.

RED CROSS SOCIETY, an international association for the relief of the sick and wounded in time of war. Henri Dunant, a Swiss gentleman who aided the medical forces in 1859 in the Italian wars, was much impressed by the needless suffering of the sick and wounded. At the end of the war he published a book, *Un Souvenir de Solferino*, in which he advocated the idea of pledging all nations to regard as neutrals the sick and wounded in war-time, and of a universal society to care for the disabled soldiers. Receiving the cordial support of La Société Génevoise d'Utilité Publique, of which he was a member, he secured the coöperation of the Swiss Federal Council in calling for an international conference to devise some plan for the alleviation of suffering during wars. Such a conference was held in Geneva, October 26–29, 1863, 16 governments being represented. Another was held August 8, 1864, and again 16 nations were represented. Nine "articles of the convention for the amelioration of the condition of wounded in armies in the field" were drawn up and signed, August 22, by 12 out of the 16 powers represented. Since then the number of signers has grown to 40. Each treaty nation has a society. The insignia is a red cross on a white background, chosen as a compliment to the Swiss government, whose national emblem is a white cross on a red ground, and it may be used by the national societies only or at their discretion. In 1868 the regulations were adopted for naval warfare by a conference at Paris. The society is given the privileges of neutrals, and all patients under its care have a similar privilege and are treated alike. By the terms of the treaty, the red cross must in all cases be accompanied by the banner of the country in whose service the society operates. Through the efforts of Clara Barton the United States Government became a party to the treaty, in 1882—it being the thirty-second government to subscribe to the convention—and an American Red Cross was formed, with Miss Barton as president. It was her idea that the scope of the society should be extended to work of relief in times of peace as well as war, and since its organization the timely and efficient work of the American Red Cross in cases of famine, fire, and flood, has been notable. The society was incorporated by Congress in 1905, with National Headquarters at the War Department, Washington, D C. President is Wm. H. Taft. *Revised by* R.W.C.

REDDING, a city and the capital of Shasta County, northern California, on the Southern Pacific railroad, 24 miles N. of Red Bluff. Timber, lime, fruit and ore are abundant in the vicinity, and sheep are raised. The city has planing and saw mills and a foundry, banks, and two papers. Population, 1890, 1,821; 1900, 2,946.

REDEMPTIONISTS. See FELIX OF VALOIS, Vol. IX, p. 58.

REDEMPTORISTS. See LIGUORI, Vol. XIV. p. 642.

REDFIELD, a city and the county seat of Spink County, South Dakota, in the northeast-central part of the state. It lies on the Turtle River, and has a number of flour mills, iron foundries and other industrial establishments. It is the seat of a college is reached by the Chicago and Northwestern and the Chicago, Milwaukee and St. Paul railroads, and in 1900 had a population of 1,015. W.F.J.

REDFIELD, ISAAC FLETCHER, jurist, was born in Windsor County, Vermont, on April 10, 1804, and was graduated from Dartmouth College in 1825. He was admitted to the bar, and rose to eminence in his profession. He was State's attorney at Derby, Vt., in 1832–35, a justice of the supreme court of the state of Vermont in 1835–52, and chief justice of that court in 1852–60. In 1857–61 he was professor of medical jurisprudence in Dartmouth College. He removed to Boston in 1861, and became New England editor of the *American Law Register*. In 1867–69 he served in Europe as special counsel for the United States in collecting claims against Great Britain and in recovering property held there in behalf of the late Confederacy. He was the author of *The Law of Railways*, *The Law of Wills*, *Civil Pleading and Practice*, *The Law of Carriers and Bailments*, and *Leading American Railway Cases*. He also edited Greenleaf's *On Evidence* and Story's *Equity Pleadings* and *Conflict of Laws*. He died at Charlestown, Mass., on March 23, 1876. W.F.J.

REDFIELD, WILLIAM C., scientist; born in Middletown, Conn., March 25, 1789. His father dying when he was thirteen years old he was forced to support himself, but spent his leisure hours in reading and studying scientific works. In 1827 he settled in New York city, where he became eminent as a naval engineer. He designed a style of barges for passenger transportation, and also towboats for freight. He is, however, best known for his investigations of the causes of storms. He died in New York city, Feb. 12, 1857. G.J.H.

REDFIELD, JOHN HOWARD, botanist; born in Middletown, Conn , in 1815; son of William C. Redfield. He was long engaged with Whitney & Sons, manufacturers of car wheels in Philadelphia, and became a partner in the firm. About 1885 he was chosen conservator of the botanical branch of the Academy of Natural Science. He classified and catalogued the entire group of North American plants. He died in Philadelphia, Pa., Feb. 27 1895. G.J.H.

REDGRAVE, RICHARD, an English painter; born in Pimlico, London, April 30, 1804. He began to study from the marbles in the British Museum in 1822, and was admitted a student in the Royal Academy in 1826. A picture exhibited at the British Institution, *Gulliver on the Farmer's Table*, was his first success. In conjunction with

Mr. H. Cole he formed the Museum of Ornamental Art at Marlborough House, which enlarged under their joint charge into the Museum of Art at South Kensington. In 1851 Mr. Redgrave was named one of the jurors on the section of fine arts. The arrangements for representing British art in the Paris Universal Exhibition of 1855 were intrusted to him. In 1858 he was appointed surveyor of crown pictures. He resigned his appointment as keeper of the royal pictures and his connection with the Department of Science and Art in 1880. Among his works are *Sermons in Stones; Startled Foresters; Tranquil Waters;* and *A Well-spring in the Forest.* He died Dec. 14, 1888.

RED GROUSE OR MOOR-FOWL. See GROUSE, Vol. XI, p. 197.

REDIA. See TREMATODA, Vol. XXIII, p. 572.

RED JACKET. Seneca Indian chief; born at Old Castle, near Seneca Lake, N. Y., in 1751. His Indian name signified "Keeper Awake," but his usual appellation came from the crimson jacket given him by a British officer. He was active on the British side during the Revolution; became noted as an Indian orator; received a silver medal from Washington in 1792; informed the government of the hostile plans of Tecumseh in 1810, and took part in the War of 1812. He was opposed to Christianity, schools, and civilized arts. He died Jan. 30, 1830. G.J.H.

REDLANDS, a town in San Bernardino County, southern California, 63 miles E. of Los Angeles and 8 miles E.S.E. of San Bernardino, on a branch of the Atchison, Topeka and Santa Fé railroad. It lies at an elevation of 1,300 feet, overlooking the beautiful San Gabriel Valley; is in an agricultural, mining and especially fruit-growing region, and has sewerage and water systems, electric lights and electric street-railways. The place is famous for its fine trees. It was founded in 1888. Population 1890, 1,904; 1900, 4,797.

RED LEAD OR MINIUM. See PIGMENTS, Vol. XIX, p. 96.

RED LIQUOR. See CALICO-PRINTING, Vol. IV, p. 608.

RED MEN, IMPROVED ORDER OF. See BENEFIT SOCIETIES, in these Supplements.

RED OAK, a city and the capital of Montgomery County, southwestern Iowa, 25 miles W. of Corning and 73 miles E. of Lincoln, Nebraska, on the Chicago, Burlington and Quincy railroad. It manufactures pottery, flour, carriages, furniture, sash and blinds. Population 1890, 3,321; 1900, 4,355.

REDOUBTS. See FORTIFICATIONS, Vol. IX, p. 383.

REDPATH, JAMES, journalist, was born at Berwick-on-Tweed, Great Britain, on August 24, 1833, came to America in early life, and became a newspaper correspondent and author. Before the Civil War he was an ardent and aggressive Abolitionist, and wrote much about the free soil struggle in Kansas. Later he established a lyceum bureau for lecturers, musicians, and public entertainments, and conducted it for many years. He visited Ireland early in the Land League times, in 1880–81, and was a zealous advocate of the League. He was for a number of years a correspondent of the New York *Tribune*, and wrote it a notable series of letters on the Land League agitation. He was for a time assistant editor of the *North American Review*. Among his books are a *Handbook of Kansas*, *The Roving Editor*, *Echoes of Harper's Ferry*, *Southern Notes*, *Guide to Hayti*, *The John Brown Invasion*, *Life of John Brown*, and *Talks about Ireland*. He died on February 10, 1891. W.F.J.

RED RIVER, an affluent of the Mississippi. See RED RIVER, Vol. XX, p. 328.

RED RIVER EXPEDITION, a military undertaking of the Civil War. In 1864, after the Mississippi had been opened, an expedition was sent up the Red River, under General Banks. It was so timed as to take place during the spring freshets, and Rear-Admiral Porter accompanied Banks with 12 gunboats and 30 transports. The land forces were defeated at Sabine Cross-Roads, and retreated to Alexandria. By this time, April 8th, the water had receded, and it was found impossible to get the fleet below the rapids. The commanders were about to leave the vessels in order to save the entire force of troops, when Lieutenant-Colonel Bailey proposed to build a dam, and having received permission, on April 30th set to work and completed it by May 12th The dam on one side of the river was made of trees, and on the other of stone, iron and rubbish. A passage sixty feet wide was left in the middle of the stream, which was deep enough to float the ships, thus saving the fleet from demolition. When the dam was finished four gunboats were floated over, but it was washed away almost entirely, and had to be rebuilt before the remainder of the fleet could be brought over.

RED RIVER OF THE NORTH. The scene of another Red River Expedition to suppress a half-breed rebellion. See RED RIVER, Vol. XX, p. 328.

RED SEAWEEDS, the common name of the *Florideæ*, a group of Algæ, mostly marine. They are among the most beautiful of plants, all having some shade of red or purple, and many of them of exceeding beauty and delicacy in form, and branching. They grow in the deeper waters, and have very characteristic organs of reproduction.

RED SNOW. The appearance of snow, as seen from a distance, is often an effect of light, which adds a peculiar charm to mountain and winter landscapes, particularly in the mornings and evenings, when the rays of the sun fall most obliquely on the surface of the snow. But snow is occasionally found in both polar and Alpine regions of a really red color. Saussure observed it in the Alps, and from chemical experiments concluded that the red color was owing to the presence of some vegetable substance. The next observations on red snow were made in the Arctic expedition under Captain Ross, when it was found

extending over a range of cliffs on the shore of Baffin's Bay for eight miles, and the red color penetrating the snow in some places to a depth of 12 feet. On the return of the expedition in 1819 the coloring-matter, as then existing in the melted red snow, was subjected to careful examination by Robert Brown and by Francis Bauer, the former botanist pronouncing it to be from a unicellular plant of the order *Algæ* (see BOTANY, Vol. IV, p. 81), an opinion which has since been confirmed.

RED WING, a city and the county seat of Goodhue County, Minnesota, in the southeastern part of the state. It lies on the Mississippi River, a short distance above the head of the part of that stream known as Lake Pepin, and is an attractive place of residence and a center of commerce by both river and rail. It is 37 miles southeast of St. Paul, on the Chicago, Milwaukee and St. Paul, the Duluth, Red Wing and Southern, and the Minneapolis and St. Louis railroads, and had in 1900 a population of 7,525. W.F.J.

REDWOOD. See SEQUOIA, Vol. XXI, pp. 705, 706.

REDWOOD CITY, a city and the county seat of San Mateo County, California. It is eligibly situated on the peninsula of which San Francisco forms the northern tip, and is 23 miles south by east from that city, between the Bay of San Francisco and the Pacific Ocean. It is an attractive place of suburban residence, and is adjacent to other places of the same character, all reached by the Southern Pacific railroad. Its population in 1900 was 1,653. W.F.J.

REDWOOD FALLS, a city and the seat of Redwood County, Minnesota, in the southwestern part of that state. It lies on the Redwood River, a little before its junction with the Minnesota River, and is surrounded by an agricultural country, with some lumbering and other industries. It is reached by the Chicago and Northwestern railroad, and in 1900 had a population of 1,661. W.F.J.

REED, SIR EDWARD JAMES, was born at Sheerness, England, on September 20, 1830, and was educated for an engineering and ship-building career, which he has pursued with eminent success. He was chief constructor for the British navy for a number of years, resigning in 1870, and afterward engaged in private ship-building enterprises. He was a member of the House of Commons for Pembroke in 1874–80, and since 1880 has sat for Cardiff. He has published *Our Iron Clad Ships* (1869); *Letters from Russia in 1875* (1876); *Japan* (1880); *The Stability of Ships* (1884); *Fort Minster, M.P.* (1885); *Modern Ships of War* (1888), and *Poems* (1902). He was knighted, K.C.B., in 1880, is a fellow of the Royal Society, and has received numerous decorations from various sovereigns for his services as a naval expert. W.F.J.

REED, JOSEPH, military officer; born in Trenton, N. J., Aug. 27, 1741; was graduated at Princeton College in 1757, and admitted to the bar in 1763. He succeeded Lord Hillsborough as representative of the colonial office in December, 1772. He held this post till February, 1775, and in June of that year became aide and confidential secretary to Washington. In 1776 he succeeded General Gates as adjutant-general of the army, a post which carried with it the rank of colonel. He was elected to the Continental Congress in 1777, and took his seat April 6, 1778. He aided in founding the University of Pennsylvania and advocated gradual abolition of slavery. He died in Philadelphia, Pa., March 5, 1785. G.J.H.

REED, HENRY, educator, was born in Philadelphia on July 11, 1808, was graduated from the University of Pennsylvania in 1825, and was admitted to the bar in 1829. He entered the faculty of the University of Pennsylvania in 1831, and four years later was made professor of English literature and rhetoric, and filled that place until his death. He was a friend of the poet Wordsworth, and brought out an American edition of his works. He was the author and editor of a number of standard works, including a life of his grandfather, Joseph Reed. He was lost at sea in the wrecking of the steamer *Arctic*, on September 27, 1854. W.F.J.

REED, THOMAS BRACKETT, statesman, was born at Portland, Maine, on October 18, 1839, and was graduated from Bowdoin College with high honors in 1860. He then studied law, taught school, and was an assistant paymaster on a gunboat on the Tennessee, Cumberland, and Mississippi rivers in the Civil War. He was admitted to the bar in 1865, and in 1868 entered the Maine legislature, where he remained until made attorney-general of the state in 1870. From 1873 to 1876 he was city solicitor of Portland, and in the fall of 1877 he took his seat as a representative in Congress. In the latter place he soon won national attention by his skill in debate, and by his exercise of a biting, sarcastic humor. In the fall of 1889 he was elected speaker of the House, and in that place had a distinguished career. He was vigorous and almost arbitrary in his rulings for the suppression of disorder and mere obstruction, and secured the adoption of a new set of rules which greatly facilitated the transaction of the legitimate business of the House. Despite his partisanship he was personally one of the most popular of men, and commanded the respect of even his strongest political opponents. He remained a member of the House until 1899, when he resigned and engaged in the practice of law in New York. He died on December 6, 1902. W.F.J.

THOMAS B. REED.

REED, WILLIAM BRADFORD, diplomat, journalist and author, was a brother of Henry Reed, a grandson of Joseph Reed, the Revolutionary patriot, and son of Joseph Reed, Jr., attorney-

general of Pennsylvania and author of a work on the laws of that state. He was born in Philadelphia, was graduated from the University of Pennsylvania, and was admitted to the bar. He was attorney-general of Pennsylvania, U. S. Minister to China, and an editor of the New York *World*. He published a *Life and Correspondence of Joseph Reed*, and edited the works of his brother, Henry Reed. He died in 1876. W.F.J.

REED-BIRD. See RICE-BIRD, in these Supp'ts.

REED CITY, a post village of Osceola County, Michigan, 69 miles N. of Grand Rapids and 65 miles W. by N. of Bay City. It is situated on the Muskegon River and is at the junction of the Grand Rapids and Indiana and the Flint and Pere Marquette railroads. It has water power, and possesses grist and wood-working mills, machinery works, and other manufacturing establishments. Pop., 1900, 2,051. G.J.H.

REED ORGANS. See HARMONIUM, Vol. XI, p. 432.

REEDSBURG, a village of Sauk County, south central Wisconsin, 14 miles N.W. of Baraboo and 45 miles N.W. of Madison, on the Baraboo River, and on the Chicago and North-Western railroad. It is noted as one of the large hop markets in that region. Population 1890, 1,737; 1900, 2,225.

REEFS, CORAL. See CORALS, Vol. VI, pp. 334–337.

REES, JOHN KROM, astronomer, was born in New York City on October 27, 1851, and was graduated from Columbia College in 1872, and from the School of Mines in 1875. He was an assistant in mathematics in the School of Mines in 1873–76, professor of mathematics and astronomy at Washington University, St. Louis, in 1876–81, and since 1881 has been at Columbia College as director of the observatory, instructor in geodesy and practical astronomy, and since 1892 professor of astronomy. He was president of the New York Academy of Sciences in 1894–96, and is an officer and member of other learned organizations. He has written much for scientific periodicals. W.F.J.

REEVE, HENRY, historian; born in Norfolk, England, Sept. 9, 1813; was educated in Geneva and Munich, and, in 1837, became registrar of the Privy Council, which office he held for fifty years. In 1855 he succeeded Sir G. C. Lewis as editor of the Edinburgh *Review*. His publications include *Royal and Republican France;* translations of De Tocqueville's *Democracy in America; France before the Revolution of 1789*, and Guizot's *Washington;* a revised edition of Whitelocke's *Journal of the Swedish Embassy in 1653–54*, and Greville's *Journal of the Reigns of King George IV and King William IV*. He died in London, Oct. 21, 1895. G.J.H.

REEVE, TAPPING, jurist, was born in Suffolk County, Long Island, N. Y., in October, 1744, and was graduated from the College of New Jersey, Princeton, in 1763. He became a lawyer and was the law preceptor of Aaron Burr. In 1784 he established a law school at Litchfield, Conn., which for many years ranked as one of the foremost in America. He was a judge of the superior court of Connecticut from 1798 to 1814, and for a time its chief justice. He also served for a term in the legislature and for one in the council. He was the author of the legislation which secured to married women the control and disposal of their own property. He died on December 13, 1823. W.F.J.

REEVES, MRS. HENRY, an English novelist; born in Crewkerne, England, 1852. Her maiden name was Helen Buckingham Mathers. In 1876 she was married to Mr. Henry Reeves, a surgeon and author of *Human Morphology*. Mrs. Reeves devoted herself entirely to writing. Her works include the poem *The Token of the Silver Lily* (1876); the novelettes, *The Land o' the Leal* and *As He Comes up Stairs* (1878); and the novels *Comin' Thro' the Rye* (1875); *My Lady Green Sleeves* (1879); *Eyre's Acquittal* (1884); and *A Man of To-day* (1894).

REEVES, JOHN SIMS, an English tenor singer; born in Shooter's Hill, near London, Oct. 21, 1822. He was trained to music by his father from an early age, and at 14 became organist of North Cray Church. He also became a proficient violinist, and sometimes undertook the duty of orchestral leader. He studied harmony and counterpoint under Calcott. In his eighteenth year he made his début at Newcastle-on-Tyne Theater, as the gipsy boy in *Guy Mannering*. He obtained an engagement at the Grecian Theater, London, where he sang under the name of Mr. Johnson; but in 1847, in *The Bride of Lammermoor*, at Drury Lane, then under the management of Macready, he first showed his full powers. Although very successful, he soon left the stage for the concert-room, and in oratorio and ballad-singing achieved the highest distinction. In 1843 he studied in Paris, and afterward at Milan, where he sang at La Scala. After his return to London he soon established his reputation as the first of modern tenors. He married Miss Emma Luccombe, a well-known singer. During 1891 he gave a series of farewell concerts, but did not entirely give up concert-singing. In 1892 he became professor in Guildhall School of Music, London. He died at Worthing, Sussex, Oct. 25, 1900.

REFERENDUM. Owing to the success of the referendum in Switzerland, especially as a check on hasty legislation, the subject has been discussed freely in the United States, and clubs formed to propagate the cause. In England the Parish Councils, under the Local Government Act, was an approach toward the referendum. See VETO, Vol. XXIV, pp. 224, 225.

REFLECTING ANGLE. See *Measuring-Instruments*, under SURVEYING, Vol. XXII, pp. 754, 755.

REFLECTION OF LIGHT. See LIGHT, Vol. XIV, pp. 590–605; also WAVE THEORY, Vol. XXIV, pp. 481–484.

REFLEX ACTION. See PHYSIOLOGY, Vol. XIX, pp. 32, 33.

REFORMATORIES. The establishment of reformatories for juvenile offenders was the first important step in the classification of criminals. This plan of separating juvenile and first offenders from adult offenders and recidivists was prompted and has been widely adopted, obviously because of the greater susceptibility of the former to reformatory influences. The majority of the states have made at least partial provision for the separate confinement of the juvenile delinquents, and in most of the rest of the states like provision is being made or is contemplated. The importance of surrounding those of criminal tendencies with wholesome and helpful environment at an impressionable age, of training them to perform some useful labor and to become productive and peaceful members of society, is being more and more deeply felt. This is further witnessed in the laws of many states, which provide for the separate trial of children, for their detention pending trial, in buildings or rooms apart from adults, and for their separate conveyance to and from court.

In spite of this tendency there yet remain many youthful delinquents who are not brought within the reach of reformatory influences. Many are to be found in jails and minor prisons and in association with adult and hardened criminals, for the most part awaiting trial and still innocent before the law Indeed, more attention is given, as a rule, to the boy or girl after sentence than while awaiting trial.

The first reformatory established in the United States was the House of Refuge, Randall's Island, New York (chartered 1824), an outgrowth of the Society for the Reformation of Juvenile Delinquents. In 1890 there were in the country 58 reformatories, with a population of 14,846. To these institutions several were added in subsequent years, and there are in addition to these some private industrial schools and reformatories for wayward or incorrigible youth, which receive either by commitment from the courts or by surrender of the child by the parent or guardian.

There is a temptation common to most institutions to allow an increase of their numbers beyond the proper limits. That this temptation has been yielded to is apparent in the enormous size of some of the juvenile reformatories, in which from 400 to 2,000 inmates are accommodated. There is now a reaction in favor of small "farm" schools, such as the Lyman School for Boys at Westboro, Massachusetts; the Industrial School for Girls, Lancaster, Massachusetts, and the "Burnham Farm," New York, organized after the plan of the *Rauhe Haus*, or after the Mettray plan, where every facility is offered for training boys in farm-work and girls in household duties. This reaction is further apparent in special efforts that are made by private societies to find places for delinquent children in private families. The work of "placing out" of children of bad physical and moral surroundings, in the country on farms, has been going on for years in some of the largest cities. This work was begun with the organization of the Children's Aid Society of New York, under the supervision of that great philanthropist, Charles L. Brace, and through it and kindred societies in Boston, Philadelphia and elsewhere, more than a hundred thousand boys and girls have been transplanted from a debasing environment to a wholesome one. Very few of the children sent to the country return to the city, and a very hopefully small percentage are ever chargeable on the community or commit criminal offenses. This preventive work must be reckoned among the first of reformatory influences among those who are criminal in their instincts or are in vicious and degrading environment. The statistics of crime in New York show a decided improvement in the matter of juvenile delinquency since the organization of these children's societies.

In this connection should be mentioned the work of such societies as the Children's Board of Guardians and the Societies for the Prevention of Cruelty to Children (q.v., in these Supplements), which are empowered to take children out of morally bad homes and to place them in better surroundings. The Children's Board of Guardians in the state of Indiana is a good example of the former type of organization, and the New York Society for the Prevention of Cruelty to Children of the latter.

The relative increase of juvenile delinquency, according to census returns, has been comparatively slight in the last decade, but these statistics cannot with safety be made the basis of any generalization, for the reason that there are so many causes that have an influence upon the result. The number in 1880 was 11,468 and in 1890, 14,846. The average age of all inmates of juvenile reformatories in the United States in 1890 was 14.23 years. Only a little more than three per cent could neither read nor write. Less than one half of one per cent had acquired a full knowledge of a trade, and less than three per cent appeared to be apprenticed to a trade. A very large percentage of the inmates of juvenile reformatories is engaged in some occupation while in confinement, but the labor is not with a view to profit as much as to training and preparation for life. At least half of the time is usually spent in the school-room.

Reformatories are now being established for older offenders, and existing prisons and penitentiaries are being converted into reformatories. (See PRISONS, in these Supplements.) This has been done in appreciation of the fact that older offenders are also susceptible to reformatory treatment, and that reformation, the primary object in the imprisonment of juvenile delinquents, may also successfully be made the chief object in prison discipline for older criminals. The tendency seems to be in the direction of providing institutions of a reformatory character for all who are capable of reformation, and places of custody for those who can never safely be returned to society again. This, at any rate, is the plan advocated by the foremost penologists, and the

institutions of the land are gradually responding to their ideas. See also REFORMATORY AND INDUSTRIAL SCHOOLS, Vol. XX, pp. 350–352.

JOHN H. FINLEY.

REFORMED CHURCH IN AMERICA, formerly known as Reformed Protestant Dutch Church in North America; was planted in the United States by members of the Reformed Church of Holland, where its first synod met and adopted confessions at Antwérp in 1563. The mother-church was presbyterian in government and Calvinistic in doctrine. This church adheres to the Apostles', the Nicene and the Athanasian creeds, the Belgic Confession and the Canons of Dort. The *Heidelberg Catechism* is expounded in the pulpit, taught in the homes, and is an authoritative manual of religious instruction. The government of a congregation or parish is by elders and deacons, elected for two years. These form a consistory having power to call a minister, and with him to receive and dismiss members. They also act as trustees of the church property. Ex-deacons and elders form what is called the "great consistory," an advisory body. One elder, together with the minister from each church in a convenient district, form what is termed a classis, an ecclesiastical body having spiritual charge of the district. Four ministers and four elders from each classis of a larger territory form a particular synod, and similar representatives from each classis, the number proportioned to the size of the classis, form the *general synod*, an ecclesiastical body that finally adjudicates any dispute on spiritual matters that arises either in the churches, or in the classes, or in the particular synods. For an account of the origin and early history of this denomination in the United States, see PRESBYTERIANISM, Vol. XIX, pp. 696–716, 718, 719, 720.

IN 1628 the Dutch settlers of New Amsterdam organized a congregation that worshiped in a loft over a horse-mill. Previously their religious instruction was cared for by schoolmasters, sent out by the West India Company. In 1635 a wooden church was built in Old Slip, and eight years later a substantial edifice was erected in the fort that stood near Bowling Green, and it was named in honor of St. Nicholas. In 1693 a third church was built in Garden Street, which became the first of the collegiate churches, when, associated with it, a new congregation was organized, and in 1729 began to worship in a new building that stood on the corner of Nassau and Cedar streets, where now the office building of a life-insurance company rears its lofty walls. This was known for a time as the Middle Dutch Church, though subsequently it came to be known as the South Church. Its large gray stone building was a British riding-school and prison during the Revolutionary War; from 1844 to 1877 it was the government post-office. The North Church joined the college in 1769, and its site was on Fulton Street. All these structures have disappeared with the northward march of New York society, but the collegiate organization still exists and its board of trustees maintain (1896) six churches and chapels in the city, each of them notable for the dignity and beauty both of their buildings and services. The consistory of the city at that time comprised 27 churches.

This wealthy denomination has extended itself through regions occupied by the descendants of the Dutch colonists, and its strength lies in the towns of the Hudson River and Mohawk valleys, and in those of northeastern New Jersey. It was not until 1767 that the Collegiate Church substituted English for Dutch in its public services. Twenty-two years later an English hymnody came into use. The hymnal is under the control of the general synod, and is a fine collection of lyrics full of refined devotion. The denomination must be classed among liturgical churches, as it provides forms of worship for public services, the use of which is optional, and offices for the sacraments, ordination and discipline, the use of which is imperative. The scholars' black-silk gown is in common use by the pastors when officiating.

Classes of this denomination exist in Philadelphia and in the states of Michigan, Illinois, Wisconsin, Iowa and Dakota. Its church property was valued in 1890 at $10,340,000.

Besides the general synod there were in 1907 four particular synods and 34 classes. There were 658 individual churches, 715 pastors and a total membership of 119,355. In their Sunday-schools, which numbered 894, there were 117,210 pupils. The total amount contributed for congregational support was $1,022,206, and for benevolent purposes $311,516. For foreign missions the sum of $80,859 was given, the church maintaining missions in the Madura district in India, in Japan, in China and in Arabia. The most important missions are at North and South Arcot, Madura, founded in 1854, the center of some 117 out-stations, and having a large corps of native pastors, schoolmasters, catechists and readers. A theological seminary is also maintained in connection with the Arcot mission.

Several attempts have been made to effect a union between the Dutch Reformed and the German Reformed churches in America. Committees from the general synods of the Dutch and of the German Reformed Church met in 1890 and drafted a plan of federation, but after considerable discussion the matter was dropped in 1894. This church is one of the constituents of the General Alliance of Reformed churches holding to the presbyterian system.

Four colleges and three theological seminaries are conducted under the auspices of the denomination. The colleges are: Rutger, at New Brunswick, New Jersey; Hope, at Holland, Michigan; Northwestern Classical Academy, at Orange City, Iowa; and Pleasant Prairie College, at German Valley, Illinois. The seminaries are at Rutgers, at Hope, and one in India. Rutgers Seminary was organized in 1785 and had in 1907, 35 professors and 260 students, a scholarship fund of $111,071, a general fund of $400,000 and a library of 43,000

volumes. Hope College had, in its theological department, 20 professors and 300 students. The seminary at the Arcot mission, India, under W. W. Scudder, had 15 students. The weekly periodical issued as the organ of the denomination is the *Christian Intelligencer* (New York).

REFORMED CHURCH IN THE UNITED STATES, formerly known as the German Reformed Church, had its origin among the early immigrants who were adherents of the Reformed Church of Germany, and began to settle in Pennsylvania about 1684. True to the doctrines of the mother-church, they early adopted and have ever since retained the Heidelberg catechism as their rule of faith and their only binding authority in matters of doctrine. This catechism, which was prepared by certain professors in Heidelberg University, and first published in 1563, teaches the natural depravity of man; salvation by grace; spiritual presence in the symbols of the Lord's Supper; baptism of infants; election of grace; but it discards the dogma of reprobation. No images are to be tolerated in the churches; the church order is presbyterian. The first independent church established by this denomination was presided over by Rev. John Philip Boehm, who began to preach in what is now called Boehm's Church, Montgomery County, Pennsylvania, in 1720. In 1727 the first Reformed Church of Philadelphia was founded, under the pastorate of George Michael Weiss. Churches were also founded in New York and as far south as South Carolina. All these were connected with and under the supervision of the classis, in Holland, of the Dutch Reformed Church, until in 1793 independence was effected by the organization of a synod. There were then in all about one hundred and fifty churches. In 1824 the synod of Ohio was formed. The general synod was not formed until 1863. The synods are composed of representatives of the classes, the same as in the Dutch Reformed Church, the general synod meeting once in three years and exercising advisory and supervisory powers. Among the educational institutions conducted under the auspices of the denomination are the college and seminary at Mercersburg, Pennsylvania, founded at Carlisle in 1835; Franklin and Marshall College, at Lancaster, Pennsylvania; Ursinus College and Seminary, at Collegeville, Pennsylvania; Catawba College, at Newton, North Carolina; Heidelberg University, at Tiffin, Ohio; Calvin Institute, at Cleveland, Ohio; Palatinate College, at Myerstown, Pennsylvania; and a theological seminary at Howard's Grove, Wisconsin. At the beginning of 1907 there were 8 synods, 55 classes, 1,738 congregations, with an aggregate membership of 279,483. The Reformed Church publishes 29 periodicals, 23 in English and 6 in German; supports foreign missions in Japan and in India, and sustains many home missions among the Indians and among recent or impoverished immigrants from Europe. See under PRESBYTERIANISM, Vol. XIX, pp. 717–721.

REFORMED EPISCOPAL CHURCH, the name of a religious body in the United States, which separated from the Protestant Episcopal Church in December, 1873, under the leadership of Bishop G. D. Cummins, who up to this date had been bishop of Kentucky in the older church. For two generations there had been much irritation existing between the Low and High Church parties of the Episcopal denomination. About the time of the general convention of 1868 the rancor of this dissension culminated in several ecclesiastical trials of evangelical clergymen, Mr. Cheney being deposed from the ministry and Mr. Tyng publicly reprimanded, ostensibly for violations of the canons, but none the less for acts expressing their evangelical views. In the autumn of 1873, during a session of the general convention, Bishop Cummins participated in a meeting of the Evangelical Alliance of New York, and especially shared in administering the rite of the Holy Communion. Although not disciplined in his own church for this act, he felt that he encountered estranged friends and the obloquy of associates. Accordingly he resigned his jurisdiction, called about him a small body of sympathizers, clerical and lay, organized a church of this title, in New York, on the 2d of December, and published a declaration of its principles. This denomination adheres to episcopacy, not as a divine right, but as an ancient and desirable form of church polity. It adheres to the doctrines of faith as set forth in the thirty-nine Articles and in the Apostles' Creed; it recognizes the Holy Scriptures as the sole rule of faith and practice; it retains a liturgy which is practically a revision of the Proposed Book of Common Prayer published by the first convention of the Episcopal Church in 1785. (See PROTESTANT EPISCOPAL CHURCH, in these Supplements.) This denomination rejects the notion that the church of Christ exists only in one order or form of polity; that Christ's ministers are priests in any other sense than as all believers are; that the Lord's table is an altar on which the body and blood of Christ is offered perpetually to the Father; that the presence of Christ in the eucharist is to be found in the elements; and that spiritual regeneration is inseparably dependent upon baptism.

The governing body of this church is styled the General Council. It first met in 1874, in New York. In this council bishops, clergymen and laymen meet without separation of orders. In it is vested authority over all Episcopal parishes in America. Under this supreme body are the synods of Canada; New York and Philadelphia; and Chicago; also missionary jurisdictions of the Pacific; two of the South, one being for colored persons; and one of the West and Northwest.

In 1877 a branch of this church was established in Great Britain, but in 1883 the branch obtained an independent existence. In 1894 it merged in the Reformed Church of England.

Bishop Cummins was presiding bishop of this denomination until his death in 1876. His successors in this position have subsequently been chosen from time to time in each general council.

In 1907 this church comprised 8 bishops, 90 presbyters, 112 parishes and missions, and about 9,400 communicants, and held property valued at $1,500,000. It has one theological seminary, in Philadelphia.

REFORMED PRESBYTERIAN CHURCHES in the United States owe their origin to the Scotch Covenanters (q. v., Vol. VI, p. 470), who held to such a belief in the kingship of Christ, that any form of human government that did not distinctly recognize the superior sovereignty of God could not receive their conscientious support. Adherents to this faith, who began emigrating to America in the early part of the eighteenth century, founded churches based upon such an adherence to the general presbyterian system as is common to all lands, and especially affirming the headship of Christ. The dissensions and disruptions that afterward occurred were mainly caused by a more or less rigid interpretation of this important article of faith. The Associate Presbytery of Pennsylvania, organized in 1753, and that of New York, organized in 1776, together with the Covenanters who had organized the Reformed Presbytery in 1774, united in 1782 to form the Associate Reformed Synod of North America. Many of the individual members of the first-named bodies, suspecting laxity of faith, refused to join, and reorganized the Associate Presbytery and the Reformed Presbytery; the latter body condemns instrumental music in churches, and still adheres to the use of the old Scotch version of the Psalms for congregational singing. A Reformed Dissenting Presbytery was also formed, which, however, seems to have been discontinued or merged in other bodies.

The reformed presbyteries organized a synod in Philadelphia and a general synod in 1823. They taught adherence to the Westminster Confession, with the proviso that anything which seemed to sanction any power in civil magistrates over ecclesiastical affairs be omitted. Ten years later came the great disruption into New Lights and Old Lights, or those who believed it right to vote and accept office under the Constitution of the United States, and those who refused thus to sanction any government that had not "God in the Constitution." The divided bodies have since been known as the Reformed Presbyterian Church in North America and the Reformed Presbyterian Church in the United States; the latter represented by the synod, which in 1895 numbered about 10,000 communicants and 116 churches, the former by the general synod, which the same year numbered 4,700 communicants.

In 1840 the Reformed Presbyterian Covenanted Church was formed by seceders from the Reformed Presbyterians, and in 1883 the Reformed Presbyterian Church of the United States and Canada was formed through a division among the members of the general synod. The Associate Reformed Presbyterians formed in 1802 a general synod, from which the Carolina synod withdrew in 1821, forming the Associate Reformed Synod of the South, which in 1895 numbered 10,088 communicants. The Associated Reformed Presbyterians became merged in 1858 into the United Presbyterian Church (q.v.). See also under PRESBYTERIANISM, Vol. XIX, pp. 717–721.

REFRACTOMETER. Various instruments for widely different purposes are known by this name. One type consists of two telescopic tubes, between which a liquid may be placed, and the degree of its refraction tested by observing a light through the telescopes, and noting the angle at which they are set to bring the light into vision. (See DENSIMETER, in these Supplements.) Another form is the interference refractometer, which is a complex affair of mirrors and prisms, which reflect the light so that interference-fringes are produced. By observing the position and varying intensity of these fringes, minute measurements of extreme accuracy are possible. It has been used much in studying the lines of the spectrum, though originally employed to obtain indices of refraction. An ophthalmic refractometer has been devised for determining the necessary correction of distance vision, which is not easily obtained with the ophthalmometer, which measures only the limits of distinct vision. If the eye errs in refraction, the image is not formed exactly in the retina, and it is important that the oculist should know whether this image is formed in front of or behind the retina, that he may judge what sort of lenses will correct the error. The operation of discovering this with the ophthalmometer is very tedious, but the refractometer in question is provided with a series of lenses so mounted on the periphery of disks that a great variety of combinations is possible. By a little experimenting with these the proper combination of lenses is found, and the visual error may be corrected by providing the patient with lenses of similar quality.

C. H. COCHRANE.

REFRIGERATING APPARATUS. Refrigeration by the ammonia-expansion system is theoretically about forty per cent cheaper than the maintenance of a low temperature with manufactured ice; that is to say, the refrigerating capacity of such machinery is forty per cent greater than the ice-making capacity. As a consequence, where artificial cold is required in large quantity a refrigerating plant is used. About 1889 Denver and St. Louis were supplied with large plants for the delivery of cold through pipes, as heat is served. Numerous other cities are supplied similarly now. At the central station ammonia is liquefied by compression, acquiring much heat during the process. Then it is cooled and sent out through a main called the "liquid line" to the customer, in whose place are expansion coils very similar in appearance to steam radiators. The liquid ammonia, being let into an expansion coil through a valve in a very small stream, begins to evaporate, and in so doing absorbs heat and reduces the surrounding temperature. When it is evaporated and its cooling work is completed, it returns to the central station through another pipe called the "vapor line,"

a suction-pump assisting it on its return journey. A third pipe, called the "vacuum line," is essential to the proper working of the system. It is connected at intervals with the other lines, which are built in sections, and in case any repairs are required, any section may be shut off pumped out by the vacuum line and then receive the necessary attention. The vacuum line may also be used as a by-pass at times. When a section is pumped out in this way the workmen who open the pipes are not in the slightest danger from ammonia fumes, as the exhaustion is so perfect that not even the smell of it remains.

The laying of the pipes for a refrigerating system requires especial care. The customary plan is to make the pipe in half-sections. The lower halves are laid in a bed of concrete and thoroughly tested for leaks before the upper half is put on. A cement joint is then made between the two parts and the whole thoroughly protected and surrounded with cement. Manholes are placed at the ends of sections, with valves for shutting off the pipe. One advantage of this system is, that no cold is lost by expansion of the ammonia on the route. The ammonia is kept under pressure and in liquid form until it reaches the customer, and does not deliver its cold until it begins to vaporize in the expansion coils. Customers who require ice, as for table use, are supplied with small brine-tanks, in which they can place cans for ice to form. Artificial cold is purchased for the warehouses where fruit, meats, etc., are kept in cold storage, by hotels and restaurants for lowering the temperature of their rooms in summer, and by the public in general for miscellaneous purposes. See ICE-MACHINES, in these Supplements.

REGINA, a town in the district of Assiniboia and the capital of the Northwest Territory, on the Canadian Pacific railroad, 357 miles W. of Winnipeg. It is the center of a rich wheat-growing and grazing region. Population 1891, 1,681; 1901, 2,645.

REGULATOR, ELECTRIC. Many forms of resistance-boxes are made for regulating electric currents for use as equalizers, stage regulators, storage-battery regulators, etc. The common pattern involves a box containing a set of spiral resistance-wires, in which wire is economized by the use of special switches to distribute the current through the resistance-conductors. One lever is arranged so that its insertion in full secures the maximum ampere-carrying capacity, with the least resistance. As this lever is withdrawn the resistance is increased, the different coils being released one at a time. Another lever is supplied for further increasing the resistance as it is withdrawn by placing the spirals in series. This combination secures a regulator having maximum ampere capacity on the first step, with the spirals all in multiple, and a maximum resistance on the last step, with the spirals all in series. As a rule, the spirals of a resistance-box should be placed in a horizontal position, as they will lose heat by convection more rapidly in an upright position than when horizontal. Spirals are made from tinned iron, galvanized iron, and from German silver. The usual method of forming them is to wind on a mandrel and afterward stretch slightly to separate the convolutions.

C. H. COCHRANE.

REHAN, ADA, an American actress; born in Limerick, Ireland, April 22, 1860. When six years old she removed to America with her father and made her début at the age of 16 at Albany, New York, in *L'Assommoir*. After playing with Edwin Booth she was engaged in 1879 by Augustin Daly; went to London with his company in 1884, and achieved great success as Katherine in *Taming of the Shrew*, in 1888. She appeared in plays of Shakespeare and Tennyson in 1893. Among her other successful characters are Maid Marian in Tennyson's *Foresters*, and the leading rôles in *The Railroad of Love* and *The Squire*.

REHOBOAM. See ISRAEL, Vol. XIII, p. 416.

REICHENBACH, CARL, BARON, a German chemist (1788–1869). See MAGNETISM, ANIMAL, Vol. XV, p. 280.

REID, SAMUEL CHESTER, naval officer, was born at Norwich, Conn., on August 25, 1783, and at the age of eleven years entered the navy. He was a captain and commander of the brig *General Armstrong* in the War of 1812, and was the hero of a famous fight at Fayal, in the Azores, where his vessel was attacked by three British ships. After a desperate struggle he scuttled his ship and with his surviving comrades escaped to the shore. Captain Reid founded the signal telegraph stations in New York harbor and the Sandy Hook pilot boat system, and suggested the retaining of thirteen stripes in the American flag and the addition of a new star for each new state. He died on January 28, 1861.

W.F.J.

REID, SIR THOMAS WEMYSS, an English journalist; born in Newcastle-on-Tyne in 1842. He was educated at Newcastle; became a journalist in 1861; in 1864 was appointed editor of the Preston *Guardian*, and in 1870–87 editor of the Leeds *Mercury*. He contributed largely to the leading reviews and magazines. He published *Charlotte Brontë: A Monograph* (1877); *Gladys Fane: A Story of Two Lives* (1883); *Mauleverer's Millions* (1885); *Life of the Right Hon. W. E. Forster* (1888); *Cabinet Portraits*, sketches of leading statesmen of both parties (1872);

Politicians of To-day (1879); and *The Land of the Bey* (1882), a narrative of a visit to Tunis during the military operations of France. He also contributed to the Leeds *Mercury* an extensive series of literary and social essays, under the title of *The Rambling Philosopher*, as well as letters descriptive of travel in various parts of the world. In 1887 he resigned the editorship of the Leeds *Mercury* and accepted the post of manager of the publishing-house of Cassell and Company. In 1890 he became editor of *The Speaker*, a weekly review. In 1891 he published a life of the late Lord Houghton, in 1902 a life of Wm. Black, the novelist, and in 1894 was knighted. He contributed the article on LEEDS to this ENCYCLOPÆDIA. Died Feb. 26, 1905.

REID, WHITELAW, journalist and diplomat, was born at Xenia, Ohio, on October 27, 1837, and was graduated from Miami University in 1856. He was a "stump speaker" in the presidential campaign of 1856, for Fremont, and edited the Xenia *News* in 1858–59. In 1860–61 he was legislative correspondent of the Cincinnati *Gazette*, and in 1861–62 was its war correspondent, his letters over the signature "Agate" commanding wide attention as among the best published during the war. In 1862–68 he was correspondent of the *Gazette* at Washington, and served also as clerk of the House Committee on Military Affairs, and as librarian of the House of Representatives. He was a cotton planter in Louisiana in 1866–67. In 1868, at the invitation of Horace Greeley, he joined the editorial staff of the New York *Tribune*, in 1879 became its managing editor, and in 1872 succeeded Mr. Greeley as editor-in-chief and also as principal proprietor. He declined appointment as minister to Germany in 1877 and again in 1881, but was minister to France in 1889–92, special ambassador to Queen Victoria's jubilee in 1897, and a member of the commission which negotiated the treaty of peace with Spain at Paris in 1898. He was the Republican candidate for the Vice-Presidency of the United States in 1892. In 1878 he was elected (for life) a regent of the University of the State of New York, and upon the reorganization of that board in 1904 he was made its chancellor. Appointed Ambassador to Great Britain, 1905. He is the author of *After the War, a Southern Tour* (1876); *Ohio in the War* (1868); *Schools of Journalism* (1870); *Newspaper Tendencies* (1874); *Town Hall Suggestions* (1881); *Two Speeches at the Queen's Jubilee* (1897); *Some Consequences of the Last Treaty of Paris* (1899); *Our New Duties* (1899); *Later Aspects of Our New Duties* (1899); *A Continental Union* (1900); *Our New Interests* (1900), and *Problems of Expansion* (1900). W.F.J.

WHITELAW REID.

REIDSVILLE, a town of Rockingham County, North Carolina, near the center of the "northern tier" of that state. It lies in the fine uplands near the head of the Cape Fear River, and is reached by the Richmond and Danville railroad. Its population in 1900 was 3,262. W.F.J.

REIGN OF TERROR. See FRANCE, Vol. IX.

REIN, WILHELM, a German pedagogue; born at Eisenach, Aug. 10, 1847. After studying at Jena, Heidelberg and Leipsic he became in 1876 director of the Eisenach Normal School, and in 1886 professor of pedagogics and director of the training school for teachers at the Jena University. He published with Pickel and Scheller *Theorie und Praxis des Volksschulunterrichts nach Herbartschen Grundsätzen* (1886–1901); and alone *Pädagogik im Grundriss* (1900); *Grundriss der Ethik* (1902); *Pädagogik in Systematischer Darstellung* (1902); *Geschichte der Methodik des Deutschen Volksunterrichts* (1889). G.A.S.

REINDEER. See DEER, Vol. VII, pp. 23, 24.

REINDEER-MOSS. See LICHENS, Vol. XIV, p. 563.

REINHART, BENJAMIN FRANKLIN, artist, was born in Greene County, Penn., on August 29, 1829, and studied art at Pittsburg and in the National Academy of Design, New York. He took to portrait painting with some success, but in 1850 went to Europe for further study, at Düsseldorf, Paris and Rome. In 1861–68 he was in England. In 1871 he was elected an associate of the National Academy. Among his best known portraits are those of James Buchanan, George M. Dallas, Charles P. Daly, Charles O'Conor, the Princess of Wales (now Queen), Lord Brougham, Thomas Carlyle, Tennyson, Mark Lemon, Edwin M. Stanton, General Scott, Stephen A. Douglas, and Samuel Houston. His historical and other works include *Katrina Van Tassel*, *Washington Receiving the News of Arnold's Treason*, *Young Franklin and Sir William Keith*, *Pocohontas*, *Evangeline*, and *Cleopatra*. He died on May 3, 1885. W.F.J.

REINHART, CHARLES STANLEY, artist, nephew of Benjamin Franklin Reinhart, was born at Pittsburg, Penn., on May 16, 1844. During the Civil War he served in the transportation department of the U. S. army, with the Army of the Potomac, and in 1868 he went to Europe to study art. In 1870 he returned to the United States and entered upon a distinguished career as an illustrator of books and periodicals. He was also an accomplished artist in colors. He received honorable mention at the Paris Salon of 1887, a gold medal at the Philadelphia Academy in 1888, a silver medal at the Paris Exposition of 1889, and two medals at the Chicago Columbian Exposition of 1893. He was an associate of the National Academy, and a member of the Society of American Artists, the American Water-Color Society, and the New York Etching Club. He died on August 30, 1896. W.F.J.

REINKENS, JOSEPH HUBERT, the first Old Catholic bishop; born at Burtscheid, near Aachen, March 1, 1821; became in 1853 professor of church history at Breslau; retired in 1858. On his writ-

ing *The Papal Infallibility* and on his protest against the Vatican Council he, in 1870, was suspended *ab ordine*, and in 1873 elected a bishop of the German Old Catholic Church, with his residence at Bonn. He died there Jan. 4, 1896. He wrote *Die Lehre des Heiligen Cyprian von der Einheit der Kirche* (1873); *Revolution und Kirche* (1876). G.A.S.

RELEASE, in law, is the act of relinquishing a claim or right to the person against whom it is held. It may consist of a discharge of a right of action, or the conveyance of one person's interest in an estate to another who has possession thereof. In the former class, a mere right is abandoned, as the right to claim damages for breach of contract, or the like. In the latter, an interest is conveyed, as in case of the release of an interest in real estate created by mortgage. A release may be expressed or implied, or it may be by operation of law, as when one does an act which the law considers inconsistent with an intention to retain the right. Thus when one releases one of several joint obligors, the others are released by operation of law. A quit-claim deed, as used in the United States, is in the nature of a release of title. See QUIT-CLAIM, in these Supplements.

RELIEFS. See SCULPTURE, Vol. XXI, p. 582 et seq.; MURAL DECORATION, Vol. XVII, pp. 40, 41.

REMENYI, EDOUARD, a Hungarian violinist; born in Hungary, in 1830. He studied at the Conservatory of Vienna, under Joseph Böhm, from 1842 to 1845; took part in the insurrection against Austrian rule in 1848, and was compelled to leave the country. He made several tours throughout the United States, the last being in 1893, and he played in all parts of the world. His playing, which had a gipsy dash and fire to it, combined with mastery of technique, was exceedingly popular. He died in San Francisco, May 15, 1898.

REMEY, REAR-ADMIRAL GEORGE C., was born at Burlington, Iowa, Aug. 10, 1841, and graduated at the United States Naval Academy. In 1859 he was attached to Hartford, East India squadron, made commander in 1872, captain in 1885, commodore in 1897. In 1862–63 he served with both the North and the South Atlantic blockading squadrons, and was present at the assault on Fort Sumter where he was taken prisoner. After the war he served in several branches of the service and on various naval stations, and in the war with Spain commanded the naval base at Key West, Fla., then became commandant, Navy Yard, Portsmouth, N. H. In 1900, he was placed in charge of the United States war fleet on the Asiatic station during the Boxer uprising in China; Chairman Lighthouse Board, 1902–03, and retired from active service by operation of law August 10, 1903.

REMSEN, IRA, chemist and educator, was born in New York on February 10, 1846, and was graduated from the College of the City of New York in 1865, and afterward from the College of Physicians and Surgeons, New York, and from the University of Göttingen, Germany. He was professor of chemistry in Williams College in 1872–76, became professor of chemistry in Johns Hopkins University in 1876, and was made president of that institution in June, 1901. He was the founder, in 1879, of the *American Chemical Journal* and has since been its editor. He has written a number of standard treatises and text-books on chemistry. W.F.J.

REMINGTON, FREDERICK, an American artist and illustrator; born in St. Lawrence County, New York, Oct. 4, 1861. He studied at the Yale Art School for two years, and in 1880 went to the Western cattle-ranges of Montana and Wyoming, and during the next four years lived the life of a genuine cowboy, which served to give him subjects for many of his sketches, and taught him the details of horses, Indians, and the men of the plains. In 1884 he sent to Harper and Brothers, New York, a number of drawings illustrating Western scenes which were immediately accepted for their originality and freshness. He afterwards illustrated several articles for Theodore Roosevelt, and some of his own. He traveled all over North America, and in various parts of Europe and northern Africa. He did some work in painting, and was elected an associate of the National Academy of Design. Among his better-known paintings are *The Dash for the Timber; The Last Stand; Past all Surgery; The Last Lull in the Fight;* and *Conjuring the Buffalo Back.* Added to his illustrative and artistic labors, his work as a sculptor places him in a peculiar position among American artists. His bronzes have attracted general attention; among them are *The Broncho Buster* and *The Wounded Bunkie.* His latest illustration is that of General Miles's *Personal Recollections* (1896). Mr. Remington published a volume, *Pony Tracks*, descriptive of his frontier experience.

RENAN, JOSEPH ERNEST, a French savant and Orientalist; born at Tréguier, Brittany, Feb. 27, 1823. He was a pupil of the celebrated Abbé Dupanloup, and was intended originally for the church. In 1845, however, his increasing scepticism and independence of thought culminated in his abandoning all thoughts of the church as a profession. At this supreme crisis of his life, his sister Henrietta, to whom Renan has paid the highest tribute of brotherly affection, proved an invaluable friend and counselor. By her assistance he was placed in a position in which he could follow out that purpose which had been gradually shaping itself in his mind — a life of study untrammeled by creeds or formularies. Thenceforward Renan's life was the uneventful one of the scholar. In 1848 he gained the Volney prize for a memoir upon the Semitic languages. His work, entitled *Étude de la Langue Grecque au Moyen-âge*, published in 1845, was crowned by the Institute. In 1849 he was sent to Italy on a literary mission by the Académie des Inscriptions et Belles-Lettres; in 1851 was attached to the department of manuscripts in the Bibliothèque

ERNEST RENAN.

Nationale, and in 1856 was elected a member of the Académie des Inscriptions in place of M. Augustin Thierry. At the end of 1860 he was sent on a mission to Syria. In 1862 he was appointed professor of Hebrew, but did not permanently occupy the chair, in consequence of opposition to his radical views on religion. In 1863 he published his well-known *Vie de Jésus*, the result being that the author was dismissed from his professorship. M. Duruy, the Minister of Public Instruction, endeavored to conceal the significance of this dismissal by giving him an office in the Bibliothèque Imperiale; he, however, strongly protested against the appointment, which was revoked June 11, 1864. At the elections to the Corps Législatif in May, 1869, he was an unsuccessful candidate. M. Renan was elected a member of the French Academy, June 13, 1878. He attended the congress of Orientalists held at Florence in September, 1878. In addition to the works already mentioned, he published numerous memoirs on comparative philology, and of a literary character. He was twice professor of Oriental languages in the College of France. In 1880 he received the cross of the Legion of Honor, becoming grand officer in 1888. He married a niece of the famous painter, Ary Scheffer.

Of the long list of Renan's works, the best known is undoubtedly his *Life of Jesus*, in which his rationalizing views, qualified by mysticism touching the sublime character of love and duty, find strong expression. This book forms a part of his *Histoire des Origines du Christianisme*, of which the other volumes are *Les Apôtres* (1866); *Saint Paul* (1867); *L'Antechrist* (1873); *Les Évangiles et la Seconde Génération Chrétienne* (1877); *L'Église Chrétienne* (1878); and *Marc-Aurèle et la Fin du Monde Antique* (1880). Between 1887 and 1891 three volumes of his *History of Israel* were given to the world. A fourth volume of this work completed the author's plan.

The estimates of Renan's work have been various, and, as in the case of all writers on theological subjects, mostly influenced by the prejudices of the critics. His *Jesus* was the creation of an erudite fancy, made attractive by the literary artist and the charm and gracefulness of his diction. There was a good deal of the epicurean in his philosophy, but despite that he was highly intellectual, as well as sincere and earnest. His later writings, in addition to *L'Histoire du Peuple d'Israël* (4 vols.), above mentioned, include *Recollections of his Youth* (1883); *Le Prêtre de Némi* (1885); *L'Origine de la Bible* (1886); *L'Abbesse de Jouarre* (1887); the Hibbert lectures delivered in London in 1880, on *The Influence of the Institutions, Thought and Culture of Rome on Christianity; L'Avenir de Science* (1891); *Examen de Conscience Philosophique* (1889); *Discours et Conférences* (1887); *Feuilles Détachées*; and *Recollections and Letters* (1892). See *Memoir and the Letters of Ernest and Henrietta Renan* (trans., 1895). He died in Paris, Oct. 2, 1892.

RENDEL, Sir Alexander Meadows, an English civil engineer; born in England in 1829; the eldest son of James Meadows Rendel. He was educated at Canterbury and Cambridge, and studied engineering under his father; in 1856, became engineer to the Leith Harbor and Dock Company, the London Dock Company, the East India railway, and other companies; and was consulting-engineer to the Secretary of State for India.—His brother, George Whitwick Rendel, also a civil engineer; born in England in 1832; was educated at Harrow, and studied engineering in the office of his father, whose assistant he was for some time; joined the Armstrong firm, as manager of the ordnance department at Elswick; designed and carried out a system of hydraulic machinery for working heavy guns; designed numerous gunboats; was a member of several commissions, especially the one appointed in 1871 to settle the types of English ironclads; was Civil Lord of the Admiralty from 1882 to 1885; and a member of the Institution of Civil Engineers.—His brother, Stuart Rendel, Lord of Hatchlands, likewise a civil engineer; born in 1834; was educated at Oxford, and was called to the bar in 1861; a member of the Armstrong and Whitworth committee for experiments in artillery (1861–63), and became a member of the Armstrong firm in 1870. In 1880 Mr. Rendel was sent to Parliament, where he was continually until 1894; in 1886 was chosen first president of the North Wales Liberal Federation; and in 1887 first president of the Welsh National Council. In 1894, on Gladstone's retirement from office, Rendel was created Baron of Hatchlands. His chief engineering-works were in connection with the harbors of refuge at Holyhead and Portland.

RENO, a city and the capital of Washoe County, northwestern Nevada, 17 miles N.N.W. of Virginia City, on the Southern Pacific, the Carson and Colorado, the Virginia and Truckee, and the Nevada-California-Oregon railroads, and on the Truckee River. It is an agricultural and mining region, and has a considerable trade. Located here are a high school, two public libraries, a national bank with a capital of $200,000, the Bishop Whitaker School for Girls and Nevada State Uuiversity. The last is a non-sectarian, co-educational institution, founded in 1886, which, in 1896, had 21 instructors, 304 students, and 4,000 volumes in its library. Population 1890, 3,563; 1900, 4,500.

RENO, Jesse Lee, soldier, was born at Wheeling, West Va., on June 20, 1823, was graduated from West Point in 1846, served gallantly in the Mexican War, received two brevet promotions for services at Cerro Gordo and Chapultepec, and was seriously wounded at the latter place. He entered the Civil War as brigadier-general of volunteers and became major-general. He led a brigade under Burnside at the capture of Roanoke Island and New Berne, commanded a division in that department for a time, and then served under General Pope at the second Bull Run and at Chantilly. At Turner's Gap, near Sharpsburg, Md., three days before Antietam, he repulsed Lee's army, but perished in the achievement. He was in action all day, and had finally turned the tide of battle in his favor when, at evening of September 14, 1862, he fell mortally wounded. W. F. J.

RENOUF, Émile, a French painter; born in Paris,

June 23, 1845. He was a pupil of Carolus Duran and Lefebvre; exhibited first at the Salon in 1872; devoted himself to *genre*, landscape and marine pictures, and was fortunate in portraying his subjects with much truth. His works include *Tourne donc, Mousse!* (1876); *Dernier Radoub*, "*Mon Pauvre Ami*" (1879); *La Neuve-île de Scin* (1880); *Un Coup de Mer* (1885); *Les Guetteurs* (1888); and *Une Partie de Cartes* (1892). He received a first-class medal at the Paris Exposition (1889), and the cross of the Legion of Honor in the same year.

RENOUF, Sir Peter le Page, Orientalist; born on the Island of Guernsey, Aug. 23, 1822. He was educated in Guernsey and at Pembroke College, Oxford; joined the Catholic Church in 1842, and in 1855 was appointed professor of ancient history and Eastern languages in the Catholic University of Ireland. From 1864 to 1885 he was an inspector of schools, and in the latter year succeeded Dr. Birch as keeper of Assyrian and Egyptian antiquities at the British Museum, retiring in 1891. He was elected president of the Society of Biblical Archæology in 1887, and was knighted in 1896. While at the college he edited two Catholic periodicals, and he was long an active writer on theological and archæological subjects. Among his productions are *The Condemnation of Pope Honorius* and *Lectures on the Origin and Growth of Religion as Illustrated by the Religion of Ancient Egypt*. He died in London, October 14, 1897. G.J.H.

RENOVO, Pennsylvania, a borough of Clinton County, on the north bank of the Susquehanna River, and on the Sunbury and Erie division of the Pennsylvania railroad, 54 miles west of Williamsport. It is the commercial and manufacturing center of a farming, mining, and lumbering region, with attractive mountain scenery, which makes Renovo also a frequented summer resort; railway work-shops, tanneries, brick and other works, supply an active trade. Population, 1891, 4,154; 1900, 4,082. C.L.S.

RENSSELAER, Indiana, the seat of Jasper County, a city on the Iroquois River, and on the Chicago, Indianapolis and Louisville railroad, 72 miles southeast of Chicago, Ill. It exports live stock and agricultural produce, and manufactures paint, crushed rock, woodwork, etc. The St. Joseph Normal Indian School, a Roman Catholic institution, is situated here. Population, 1890, 1,455; 1900, 2,255. C.L.S.

RENSSELAER POLYTECHNICAL INSTITUTE, a school founded in Troy, New York, in 1824, by Stephen Van Rensselaer for the teaching of theoretical and practical science. It was reorganized in 1849 on the basis of a general polytechnic institute. There are three buildings given up to lectures, museums and laboratories and a large gymnasium. The course in civil-engineering has been supplemented since 1885 by a course in general science. There are 40 instructors, some 590 students and the library contains over 5,000 volumes. The school is non-sectarian, and is supported by its dues and fees, the annual tuition being $200. See also Technical Schools, in these Supplements.

RENWICK, Edward Sabine, inventor, son of James Renwick, was born in New York on January 3, 1823, became an engineer, repaired the steamship *Great Eastern* without docking her, and made many inventions. W.F.J.

RENWICK, Henry Brevoort, engineer, son of James Renwick, was born in New York on September 4, 1817, was graduated from Columbia College in 1833 and was employed by the U. S. government as an engineer. He died on January 27, 1895. W.F.J.

RENWICK, James, scientist, educator and author, was born in England on May 30, 1790, of Scotch descent, and was brought to New York in 1794. He was graduated from Columbia College in 1807, spent several years travelling in Europe with his friend Washington Irving, and then became an engineer in the U. S. army and, beginning in 1820, professor of natural philosophy and chemistry in Columbia College, in which latter place he spent the rest of his life, becoming professor emeritus in 1853. He planned the Morris canal, across New Jersey, and patented the use of inclined planes instead of locks. He was a fine linguist and classical scholar, an accomplished astronomer, and an artist in water colors. He was the author of many scientific and biographical volumes. He died in New York on January 12, 1862. W.F.J.

RENWICK, James, Jr., architect, son of James Renwick, was born in New York on November 3, 1818, was graduated from Columbia College in 1836, became an engineer and built the reservoir at Fifth Ave. and Forty-second St., where the New York Public Library now stands. He then became an architect, and built Grace Church, on Broadway, and the St. Patrick's Cathedral, on Fifth Ave., New York; the Smithsonian Institution, Washington, and many other notable edifices. He died in New York on June 23, 1895. W.F.J.

REPRODUCTION, Animal. See Embryology, in these Supplements.

REPRODUCTION, in plants, from the standpoint of morphology, has already been considered under Morphology, in these Supplements. It only remains to consider it from the physiological standpoint. The fundamental fact of reproduction is the separation from the parent body of a mass of protoplasm which is capable of developing a new organism. Several kinds of reproduction are recognized, but all are reducible to the above statement. As with all other plant-functions, a certain power of reproduction is retained by all cells not highly specialized, certainly by all cells of primitive struc-

ture. Owing to this fact, reproduction by "vegetative multiplication" is common; that is, certain portions of the vegetative body, under suitable conditions, can develop a complete organism. The simplest form of vegetative multiplication is seen in those one-celled plants which multiply by cell-division. In the case of multicellular plants, this process would result simply in the growth of the body; but in these plants vegetative multiplication is secured by the separation of certain portions of the body, as the dying away of a main axis and the isolation of branches, each of which can reproduce the complete organism, the formation of buds of various kinds, tubers, etc. The power of vegetative multiplication is evident even in the highest plants, which can be propagated by grafts, cuttings, etc., in some cases even every smallest fragment of the parent body being able to produce a complete organism. The power of vegetative multiplication, while generally diffused, often becomes specialized in distinct organs, such as the "gemmæ" of certain liverworts and other groups. As the transition from general to specialized vegetative multiplication is gradual, so is the transition from the specialized organs for vegetative multiplication to the specialized cells known as "spores."

As distinguished from reproduction by vegetative multiplication, the other phase of reproduction is that by spores. A spore is a single cell specialized for reproduction, and represents the highest degree of differentiation of the reproductive power. Two kinds of spores are recognized, differing from each other, not in their power of reproduction, but in their origin. One, the *asexual spore*, is formed by the ordinary processes of cell-division; the other, the *sexual spore*, is formed by the union of two sexual cells, known as *gametes*. Asexual spores are produced by almost all plants, while sexual spores are wanting among the lowest plants, and also among certain high plants (such as the higher fungi) in which sexuality has been lost through degeneracy. Asexual spores are developed either within a special cell, the sporangium, or by the abstriction of certain specialized branches. It is a notable fact that when sexual spores appear, both they and the asexual spores continue, among Thallophytes, to be produced by the same plant body. Among those higher Thallophytes in which alternation of generations becomes apparent, and a sporophyte is developed which produces asexual spores, the gametophyte still retains its power of producing asexual as well as sexual spores. In such cases three sets of spores appear in the life-history of the plant; viz., the sexual spores of the gametophyte, and the asexual spores of the gametophyte and sporophyte. These two kinds of asexual spores differ from each other in this regard: that the gametophyte spore reproduces its parent plant, the gametophyte; while the sporophyte spore produces, not another sporophyte, but the antithetic generation, the gametophyte. This difference becomes a striking resemblance, however, by stating that asexual spores always produce gametophytes, and sexual spores produce only sporophytes. In groups higher than the Thallophytes (Bryophytes, Pteridophytes and Spermaphytes), in which alternation of generations becomes very distinct, the gametophyte has lost its power of producing asexual spores, which are confined strictly to the sporophyte.

In the case of sexual reproduction, the preparation of the spore is more complex. Two sexual cells, the gametes, are developed, having originally been derived from motile asexual spores (zoöspores), and by their fusion (called *conjugation* if the gametes are similar, and *fertilization* if they are dissimilar) form the spore (*zygospore* or *oöspore*). The gradual transition from zoöspores to gametes, and the differentiation of similar gametes into very dissimilar ones (*oöspheres* and *spermatozoids*), have been discussed under MORPHOLOGY, in these Supplements. The process of fertilization is as follows: The male gamete, by its own activity, or more passively conducted, is brought into the neighborhood of the female gamete. In case the male gamete is a spermatozoid (free-swimming), as in Algæ, Bryophytes and Pteridophytes, the act of fertilization is connected with aquatic conditions, and the free-swimming gamete is observed to be attracted to the oösphere by a certain substance secreted by the female organ, and diffused through the water. In mosses this substance is found to be cane sugar; in ferns, a salt of malic acid. In heterosporous plants the approach is usually different, the aquatic conditions being absent, and the male gamete not being developed into a spermatozoid. In such cases the gamete is conducted to the oösphere through a specially developed tube. Another preparatory process which should be noted is "the reduction of chromosomes." The nucleus of all cells is found to consist partly of a denser substance, which assumes the form of a delicate thread or filament. As this substance stains readily, it has been called *chromatin*. The chromatin filament, in the resting stage of the nucleus, appears as a continuous coiled thread. In cell-division, however, the thread breaks up into a definite number of parts, called *chromosomes*. The number of chromosomes is constant in each kind of plant; if it be eight, that number appears in every cell, the process of cell-division carefully dividing each chromosome of the parent nucleus. By the union of gametes, however, the number of chromosomes in the resulting spore is doubled, and this doubled number appears in all the cells of the sporophyte derived from the oöspore. It is evident that this would lead eventually to an indefinite multiplication of chromosomes. The provision against this result is the process of "reduction of chromosomes." This has been observed carefully in the higher plants, in which there is distinct alternation of generations, and is as follows: In the case of a sporophyte whose nuclei contain sixteen chromosomes, in the division of the mother-cells for the purpose of producing the asexual spores the reduction of chromosomes by one half occurs, so that the nuclei of the asexual spores contain but half the number of chromosomes possessed by all the cells of the sporophyte,—that is, 8 instead of 16. This sudden reduction is described as due to the fusion of

chromosomes in pairs. As the asexual spore, with its eight chromosomes, produces the gametophyte, the number eight will appear in all the cells of the gametophyte, among which are the gametes. The two gametes, therefore, approach each other with the reduced number of chromosomes, and by their coalescence produce a cell, the oöspore, in which the number of chromosomes is restored to 16. The oöspore developing the sporophyte, the number 16 appears in all the cells of the sporophyte, to be reduced suddenly again upon the formation of the asexual spores.

The two gametes, having been brought into contact as described above, begin to fuse part with part, cytoplasm with cytoplasm, centrosphere with centrosphere, and nucleus with nucleus, the chromosomes of the two gametes, however, remaining distinct. The chromosomes do not fuse throughout the whole history of the sporophyte, which results from the oöspore, until with the formation of the asexual spores they suddenly fuse, and the reduced number appears. The first evident result of fertilization is the formation of a cell-wall about the fused product, thus completing the structure of the oöspore. Two series of results follow: 1. The formation of the embryo from the oöspore by cell-division; and 2. Changes, more or less extensive, in neighboring structures not directly concerned in the act of fertilization. These changes result in the formation of the structure known as "the fruit," which thus has a physiological rather than a morphological significance.

The chromosomes are supposed to be the material carriers of hereditary characters, and are observed to be an aggregation of very minute disks that have been called *ids*. In the case of sexual reproduction, two sets of chromosomes, with their numerous ids, carrying two sets of hereditary characters derived from long lines of ancestors, unite, making a combination which, in the very nature of things, cannot often be duplicated. Consequently, sexual reproduction is looked upon as a prolific source of variation.

Probably the most difficult problem of heredity connected with plants is to be found in the fact of alternation of generations, in which spores do not reproduce the parent form, but a very dissimilar structure. A suggested explanation is that this phenomenon may be accounted for by the fact that in fertilization the two sets of chromosomes do not fuse, the result being a structure (the sporophyte) unlike the parent form; but when they do fuse in the production of asexual spores, these spores reproduce the original form (the gametophyte).

Connected with the subject of reproduction is that of sexual affinity. Gametes which enter into sexual union are produced usually by the same species, but the possibility of the union of gametes of different specific origin is witnessed by the production of hybrids,—a phenomenon very common among plants. The possible range of hybridization has not been determined, but it varies widely in different groups of plants, some hybridizing extensively, others apparently not at all. In the groups which hybridize, species of the same genus cross freely, and sometimes species of different genera, but whether a wider range of crossing is possible remains to be discovered.

JOHN M. COULTER.

REPÚBLICA MAYOR DE CENTRO AMERICA, the title under which the three American republics of Honduras, Nicaragua and San Salvador formed a confederation by the treaty of Amalpa, ratified in 1896. See HONDURAS, NICARAGUA and SAN SALVADOR, in these Supplements.

REPUBLICAN PARTY. The Republican party, at the time of its origin, 1854, was an amalgamation of little parties and factions, which, in the course of twenty years, had been split from the Whigs and Democrats by the various phases of the slavery question. One element was the Free-Soil party, which furnished such leaders as Julian, John P. Hale, Charles Sumner, Wilmot, Francis P. Blair and Charles Francis Adams. Another was that faction of the Whigs which refused to accept the Fugitive Slave Law or indorse the Compromise of 1850, and was represented by Abraham Lincoln, William H. Seward, Horace Greeley, Henry Wilson, Thaddeus Stevens, John Sherman, William L. Dayton and William Pitt Fessenden. A third part was contributed by the Know-Nothings, led by Nathaniel P. Banks, Schuyler Colfax and Henry Winter Davis. A fourth part came from the Democrats, under Hannibal Hamlin of Maine, Simon Cameron of Pennsylvania, Gideon Wells of Connecticut, William Cullen Bryant and Montgomery Blair. Finally, there was a contingent of War Democrats, who joined it after secession began, and, in many instances, drifted away in the days of reconstruction. Such men were Andrew Johnson, John A. Dix, John A. Logan, John Cochrane, Daniel E. Sickles, Benjamin F. Butler and Edwin M. Stanton.

The political factions these men led had little in common, save a strong determination not to see the territories, and especially those north of the "thirty-six-thirty" line, opened to slavery. When, therefore, the Kansas-Nebraska Bill was before Congress in 1854, forgetting all differences, and remembering only the common cause, they united, and, under the name of "Anti-Nebraska men," fought for the freedom of the territories. But what took place in Congress had already taken place all over the North. Everywhere, in 1854, Whigs and Free-Soilers and Democrats were holding conferences and state conventions and forming "fusion tickets," and naming the new party. Just when the name *Republican* was applied cannot be determined. It was used at a conference at Ripon (Wisconsin) in March, and at a conference of Anti-Nebraska Congressmen in May, and by state conventions in Michigan, Maine, Ohio, Indiana, Illinois and Iowa. Success attended the party from the start, and at the elections of 1854 it carried 15 out of 31 states, secured 11 Senators and a plurality of the House of Representatives. This was so encouraging that in December, 1855, the state committees of Maine, Vermont, Massachusetts, New York, Pennsylvania, Ohio, Michigan, Indiana and Wisconsin issued a call for a convention at Pittsburg, Feb. 22, 1856, where the national organization of the party was completed. A national com-

mittee was elected and a nominating convention summoned to meet at Philadelphia, June 17, 1856.

The platform then adopted declared against the repeal of the Missouri Compromise, against the extension of slavery into the free territories, and called for the admission of Kansas as a free state, and for a railroad to the Pacific. The candidates were John C. Frémont, a Free-Soiler, and William L. Dayton, an Old Whig, and with the rallying cry, "Free soil, free speech, free men, Frémont," the party entered the campaign, and was defeated, but elected 92 out of 237 Congressmen. The Dred Scott decision, the Lecompton Bill, and the breaking up of the Know-Nothings in the course of the next two years, added thousands to its membership, and in 1860 its candidates, Abraham Lincoln and Hannibal Hamlin, were elected. The Republicans then stood for a homestead law, a protective tariff, a river and harbor bill, a railroad to the Pacific, and all the other principles they declared for in 1856. The events of the war threatened for a time to split the party, and in 1864 the radical element went so far as to hold a convention at Cleveland and nominate Frémont and General John Cochrane of New York, the popular Irish leader. But taking, temporarily, the name of National Union Party, the Republicans nominated Lincoln and Andrew Johnson, a War Democrat, and in their platform indorsed the prosecution of the war for the Union, the emancipation proclamation, the Thirteenth Amendment, the redemption of the debt, and the enforcement of the Monroe doctrine in Mexico. The death of Lincoln, following hard upon his inauguration, put Johnson in the chair, and the long quarrel over reconstruction began. The Civil Rights Bill, the Freedmen's Bureau Bill, the Fourteenth Amendment, the Reconstruction Bill, and the Tenure of Office Act were passed, many of them over the veto, and Johnson was impeached, tried, and not found guilty.

In 1868, U. S. Grant and Schuyler Colfax were nominated and elected, and on their appearance a new era began in the party history. Most of the old leaders, Lincoln, Seward, Chase, and Wells, were gone; a new generation, represented by Blaine, Conkling, Sherman, Edmunds, and a host of others, was in control, and to it fell the task of dealing with the evils which sprang from reconstruction and the enfranchisement of the negro. This the party did by coercive legislation and vigorous executive action. The legislation comprises the Fifteenth Amendment, the "Kuklux Act" (April 20, 1871), or so-called "Force Bill." The executive measures were the proclamations of Grant, under the "Kuklux Act," suspending the writ of *habeas corpus* in certain counties of South Carolina.

The result of this legislation, and of the scandals (such as the Crédit Mobilier, the whisky frauds and the Louisiana outrages), was the Republican "bolt" (1870–72), and the formation of the Liberal Republican party, demanding general amnesty to rebels, civil service reform, local self-government for the states lately in rebellion, no more land grants to corporations, and a return to specie payments. Though the loss of this wing was serious, the party was not crippled, and in 1872 re-elected Grant over Greeley (the candidate of the combined Democratic and Liberal Republican parties) by an immense majority.

With the second inauguration of Grant the war issues began rapidly to disappear and financial questions to take their place. The Democrats demanded more paper, and the payment of the debt in paper money. The Republicans demanded a speedy return to specie payment, and as a first step toward this had begun to contract the legal-tender currency in Johnson's adminsitration. But the West cried out so vigorously that it was stopped, and not till Jan. 14, 1875, was an act passed providing for a resumption of specie payments on a certain day. The day chosen was Jan. 1, 1879. Meantime silver had been demonetized (Feb. 12, 1873), and as this made gold the only coin in which bonds could be paid, the idea spread that it was a scheme to give bondholders more than they deserved, as many had paid for their bonds in paper. In 1878, therefore, Congress passed the Bland Silver Bill, which Hayes vetoed, and which Congress, by great majorities (Feb. 28, 1878), passed over the veto.

Hayes and Wheeler were nominated at Cincinnati in June, 1876, and after a close contest at the polls were declared duly elected by the Electoral Commission (March, 1877). In 1880 a desperate effort was made by three Republican "bosses," Logan, Conkling and Cameron, to nominate Grant for a third term. This caused a convention of anti-third-term Republicans to be held at St. Louis, where resolutions condemning the idea were passed. But the idea would not down, and in the national convention at Chicago the vote for Grant was never less than 302, and twice rose to 312. The vote for Blaine was equally solid. The result was the union of all anti-third-term men on James A. Garfield and Chester A. Arthur.

The issues in 1880 were tariff, civil service, polygamy and restriction of Chinese immigration. The assassination of Garfield by Guiteau (July 3, 1881) put Arthur in the chair. The memorable acts of his term of office were the reduction of the postage, the tariff of 1883, the Civil Service Reform Act, the American Shipping Act, the law increasing pensions, suspension of Chinese immigration for ten years, and the retirement of the trade dollar.

The nomination, in 1884, of James G. Blaine and John A. Logan was followed immediately by the revolt of such Republicans as opposed the political principles and methods for which Blaine stood, by the formation of the Independent, or "Mugwump," party and by the election of Grover Cleveland.

For the first time in 24 years the Republican party lost the Presidency, and, though it was regained in 1888 by the election of Benjamin Harrison and Levi P. Morton, it was lost again in 1892 by the re-election of Grover Cleveland. The memorable acts of Harrison's term are the McKinley tariff, the Silver Bill, the Original Package Law, the Immigration Law, that providing for international copyright, and the Chinese Exclusion Law. In 1892 Harrison and Whitelaw Reid were the candidates, nominated by a convention at Minneapolis, June 7th. The platform called for protection, bimetallism, admission of

the territories, the cession of arid lands to the states and anti-trust legislation.

Though defeated at this election, the party was successful at the next Congressional election in the autumn of 1894, and regained the House by a great majority. In June, 1896, William McKinley and G. A. Hobart of New Jersey were nominated for the Presidency and Vice-Presidency at St. Louis, on a platform declaring for the gold standard, a protective tariff, the Monroe doctrine, reciprocity treaties, restricted immigration and Cuban independence. On the 3d of November they were chosen by the popular vote for electors, having carried, among others, every state from Iowa to the Atlantic north of the Ohio and Potomac rivers. J. B. McMaster.

The platform of the party in the Presidential election of 1900, as formulated at the National convention held at Philadelphia, June 20 (1900), calls for the maintenance of a protective tariff and a law making gold the standard of value. The nominations were William McKinley for President and Governor Theodore Roosevelt for Vice-President. The renomination of Mr. McKinley fulfilled universal expectation within the party, while the choice of Mr. Roosevelt was deemed a happy as well as a strong one. The administrative policy of the McKinley administration with regard to the territorial possessions won from Spain was deemed just and wise and was heartily endorsed. On the question of trusts, the platform affirms that the party recognize the necessity and propriety of the honest coöperation of capital to meet new business conditions and especially to extend the nation's rapidly increasing foreign trade, but it condemns all conspiracies and combinations intended to restrict business, to create monopolies, to limit production, to control prices. The other planks adopted were those touching the Isthmian canal, the Philippine problem, the attitude of the government with regard to Britain's war with the South African republics, and its attitude on the subject of Cuban independence. The issues of the Nov. elections gave Mr. McKinley an electoral vote of 292 and Mr. Bryan 155. The Republican Nat. Convention held in 1904, nominated Theodore Roosevelt for Pres., and Chas. W. Fairbanks for Vice-Pres. The Nov. election gave the Republicans 336 electors and the Democrats, 140.

The *Republican* National Convention held at Chicago, in June, 1908, nominated William Howard Taft, of Ohio, for President, and James Schoolcraft Sherman, of New York, for Vice-President.

The planks of the platform adopted by the Convention are: Endorsement of the policies inaugurated by the administration of Theodore Roosevelt and of recent Republican legislation; revision of tariff; establishment of postal saving banks; enactment of the employer's liability law; modification of the Sherman anti-trust law; a more accurate definition of the rules of procedure with respect to the issuance to the writ of injunction, and no issuance of an injunction, or temporary restraining order without notice, except when irreparable injury would result from delay; protection to American labor and to the farmer; equal justice and equal rights to the negro; conservation of our national resources, and systematic improvement of our waterways; increase in the efficiency of army and navy; protection of American citizens abroad; revival of our merchant marine; liberal administration of pension laws; establishment of a bureau of mines and mining; speedy naturalization of the Porto Ricans; immediate admission of New Mexico and Arizona as separate states into the Union; recommendation of the 100th anniversary of the birth of Abraham Lincoln to be celebrated as a national holiday.

REQUISITION, a requisition of title is a written inquiry made by one contemplating the purchase of land, or his solicitor, and directed to the owner thereof, in regard to some apparent insufficiency in the title. The most familiar use of the term is the demand of the governor of one state made upon the governor of another state for the return of a fugitive from justice under the provisions of the United States constitution.

RESACA, a village of Gordon County, Georgia. It was here that on May 14 and 15, 1864, Sherman fought one of the first battles of his celebrated Georgia campaign. Knowing that General Johnston was marching toward Resaca, Sherman dispatched McPherson to cut off his supplies by the railroad, and also to prevent Johnston from gaining this desirable position. McPherson, however, was unsuccessful. As soon as Sherman heard of this failure he himself marched on to Resaca, and on the 14th skirmishing and artillery fire continued all day. On the following day McPherson gained an elevated position which enabled him to destroy the railroad bridge over the Oostenaula River. Johnston tried in vain to dislodge him, but, finding himself unable to do so, and being close pressed by Sherman and Hooker, retreated on the night of the 15th.

RESACA DE LA PALMA, Texas, in Cameron County, on the Rio Grande del Norte, is celebrated as the scene, May 9, 1846, of the victory of 2,000 American soldiers, under Gen. Z. Taylor, over 6,000 Mexicans. C.L.S.

RESCISSION, a term in use in respect to contracts, and means an annulment or refusal to perform the contract.

RES GESTÆ, the subject-matter of a transaction, and includes the facts which surround the transaction so as to be a part of thereof. The term is used chiefly in connection with a rule of evidence to the effect that evidence of statements, conversations or acts can be received only when such statements, conversations or acts are a part of the *res gestæ* of the controversy.

RESPIRATION, in botany is applied to that phase of destructive metabolism (catabolism) which involves a gaseous interchange between the plant and the air, the plant absorbing oxygen and giving off carbonic dioxide.

RESURRECTION-PLANT, a popular name given to certain species of *Selaginella*, one of the genera of club mosses (*Lycopodinæ*), which exhibit

strong hygroscopic properties. The most common species is *S. lepidophylla*, from Lower California and Mexico. It is a nest-like ball when dry, hence often called bird's-nest moss, but when moist unfolds and displays its dense, fern-like branches.

RESUSCITATION OR ARTIFICIAL RESPIRATION. See DROWNING, Vol. VII, pp. 410–411.

RESZKE, EDOUARD and JEAN DE. See DE RESZKE, in these Supplements.

RETENE, a hydrocarbon ($C^{18}H^{18}$) found in some bitumens and in fossil pine stems. It is produced in the distillation of wood and on passing acetylene through a red-hot tube. It forms white flakes, soluble in alcohol, ether and carbon-disulphide; melts at 98°5 and boils at 390°.

RETENTION OF URINE. See VESICAL DISEASES, Vol. XXIV, p. 207.

RETICULARIA. See PROTOZOA, Vol. XIX, pp. 867–868.

RETINA. See EYE, Vol. VIII, pp. 714–720.

RETRIEVER. As the name implies, the retriever is a breed of dog trained to find out and bring back any killed or wounded game. The work of the retriever was long done by various breeds of dogs, such as the pointer, setter or spaniel, but, in addition to its spoiling these dogs for their regular work, they were found to be too hard-mouthed,—the worst fault possible in a retriever, as he wastes more in game injured than would have been lost without him. Crosses with the Newfoundland were tried, and gradually two kinds of retriever were introduced. One variety, known as wavy-coated, was probably the result of a cross with the setter; and the other, known as curly-coated, is from the water-spaniel or poodle. Not much attention was paid to the retriever until the introduction of dog-shows, about 1850, but since that time the breed has been kept free from any fresh cross, with a great improvement in the appearance. The two varieties of retriever differ only in coat; the curly coat should curl closely and firmly all over the body, the wavy coat should fall straight and thick. An intelligent large head, with a full clear eye, should always be seen in the retriever. Legs and feet need to be large and strong. The retriever should not be too small, as it needs a powerful dog to retrieve a hare successfully. The retriever makes a very good watch-dog, and numberless bad specimens of the breed are to be found fulfilling this vocation only. The pure retriever is gentle in temper and easy to command.

RETTING. See FLAX, Vol. IX, pp. 257–258.

REUSS, a river. See SWITZERLAND, Vol. XXII, p. 815.

REUSS, EDUARD WILHELM EUGEN, a Protestant theologian; born at Strasburg, July 18, 1804; studied at Strasburg, Göttingen, Halle and Paris. He was from 1834–88 professor of Biblical and Oriental sciences at the University of Strasburg, where he died April 15, 1891. Among his works are *Geschichte der Heiligen Schriften des Neuen Testaments* (1842); *Histoire de la Théologie Crétienne an Siècle Apostolique* (1852); *L'épitre aux Hébreux* (1861); *Bibliotheca Novi Testamenti Græci* (1872); *Geschichte der Heiligen Schriften des Alten Testaments* (1881); *Das Buch Hiob* (1888); and a French translation of the Old Testament with commentaries.

G.A.S.

REUTER, PAUL JULIUS, BARON VON, founder of the Reuter Telegram Company at London; born at Cassel, July 21, 1821. In 1849 he established the first news agency with headquarters at Aachen, which were removed to Verviers, then to Quiêvrain, and in 1851 to London. In 1858 he succeeded in interesting the English press, to adopt his dispatch services, when he established branch offices at the business centers of the entire world. In 1865 he was granted the privilege by King George of Hanover to lay a submarine cable between Norderney and England, and in 1869 he received the concession from the French Government to connect France and the United States by a cable. In 1871 he was ennobled by the Duke of Saxe-Coburg-Gotha. He died at Nizza, Feb. 25, 1899. The present manager of the Reuter Telegram Company, which furnishes the latest political, commercial and financial news is BARON HERBERT VON REUTER, oldest son of Paul Julius. G.A.S.

REVELATION. See APOLOGETICS, Vol. II, pp. 167–169; INSPIRATION, Vol. XIII, pp. 161–163; and PROPHET, Vol. XIX, pp. 842–845.

REVENUE. See FINANCE, Vol. IX, pp. 153–167.

REVERE, PAUL, engraver and patriot, was born in Boston, of French Huguenot descent, on January 1, 1735. He was trained as a goldsmith, and became an expert engraver on silver plate. He also became a copperplate engraver, and produced many portraits of distinguished men, and also the plates for the printing of Massachusetts paper money in 1775. In the latter year he was commissioned by Congress to learn the art of making gunpowder, and established a mill for that purpose — the only one the patriots had at that time. The night before the battle of Lexington, on receiving a signal from a friend in Boston, he rode on horseback from Charlestown to Lexington, warning the people of the coming of the British troops. This incident has been finely described by Longfellow in one of his best ballads. Revere was also one of those who threw overboard the tea in Boston harbor. He served for a time in the Revolutionary army, and after the war established at Canton, near Boston, a foundry for the manufacture of church bells. He died in Boston in May, 1818. W.F.J.

REVERSION OR ATAVISM. See BREEDS AND BREEDING, Vol. IV, p. 221.

REVERISON, in law. See REMAINDER, Vol. XX, pp. 384–385.

RÉVILLE, ALBERT, theologian; was born at Dieppe, France, on November 4, 1826, and became a minister and theological instructor of the Protestant Church. In 1849 he was settled as pastor of the Walloon Church at Rotterdam; from 1851 to 1872 he lectured on theology at the

University of Leyden, and in 1880 became professor of the history of religions in the College of France. His published works include a *Manual of Religious Instruction* (1863); *The Divinity of Jesus Christ* (1869); *Prolegomena of the History of Religions* (1881); *Native Religions of Mexico and Peru* (1883); *Religions of Uncivilized Peoples* (1883); *The Chinese Religion* (1889); a *Comparative History of Philosophy and Religion*, and other treatises on *Satan*, on *Redemption*, and on *Apollonius of Tyana*. His writings have had a wide circulation as authoritative expressions of the most advanced religious thought in the French Protestant churches. W.F.J.

REVISION OF THE BIBLE, changes made necessary by change of language and advance of knowledge. The body appointed in 1870 was divided into two parts, one of which worked on the New and the other on the Old Testament. They met once a month in London, and co-operated with a like body in America, which met once a month in New York. The whole body consisted of 79 members, 52 in England and 27 in the United States. The revised New Testament was published in 1881, and the revised Old Testament in 1885. See also ENGLISH BIBLE, Vol. VIII, pp. 348–349.

REVOLUTIONARY SOCIETIES. See COLONIAL SOCIETIES, and GENEALOGIES, AMERICAN, in these Supplements.

REVOLUTIONARY WAR, AMERICAN. See UNITED STATES, Vol. XXIII, pp. 784–786.

REVOLVER, a firearm similar to the pistol, but having a chambered cylinder between the barrel and the breech-mechanism, each chamber carrying a cartridge, so that it can be fired, without reloading, as many times as there are chambers. Each motion of the trigger brings a chamber into line with the barrel, so that its cartridge may be discharged at the next pull on the trigger. Numerous patents for this principle have been taken out, an American by the name of Elisha H. Collier patenting such a weapon in the United States and England about 1818. In 1835 Colonel Samuel Colt patented his famous revolver. The most recent improvement is known as the hammerless revolver, because it has a concealed hammer that cannot be caught by accident, causing the unintentional discharge of the piece. The trigger cannot be pulled unless at the same time a pressure is applied to a safety-latch which releases the internal hammer. The object of the arrangement is to render the revolver absolutely secure against accidental discharge in the pocket. See also GUNMAKING, Vol. XI, p. 253; COLT, SAMUEL, Vol. VI, p. 149; and *Revolvers and Pistols*, under GUNMAKING, in these Supplements.

REWARD, a sum of money or other thing of value in the nature of a premium paid to a person for the performance of some special or extraordinary service. A reward may be offered by the government, or by a private person. If offered by the government it is a premium usually consisting of a sum of money to be paid by authority of law for the performance of some act for the public good. If by a private person, it is for the performance of some special service of value, chiefly to the person making the offer. A reward is governed in character by the nature of the service desired, rather than by the amount of labor or skill required in performing it, and differs widely from ordinary payment or compensation. It is usually governed by the desirability of accomplishing the purpose, and the amount of work involved has little to do with fixing the amount of a reward. Rewards are usually offered to the public in general, in the hope that some one may be found who, through accident or good fortune, may be able to perform the service. They are frequently offered by the government in the case of escaped criminals, but usually only upon the condition that the accused when taken shall be finally convicted. The publication of an offer of reward is a general offer, and the person who accepts it by doing the act desired is entitled to the reward and can sue for its recovery. Rewards are frequently offered by private persons for the return of lost property, and if the finder acts upon the knowledge that a reward has been offered he is entitled to claim it. One who is entitled to receive a reward upon the conviction of a criminal may still be a competent witness against the accused, in the absence of a statute to the contrary.

REYER, ERNEST, a French musical composer, whose real name was Rey; born in Marseilles, Dec. 1, 1823. At the age of 16 he went to Algiers as a government official, and continued his pianoforte practice and began to compose. His compositions became popular, and in 1848, when the Revolution deprived him of his situation, he returned to Paris and completed his musical education under his aunt, Madame Louise Farrenc. He composed the music for several successful operas, among them being *Le Selam; Maître Wolfram; Sacountala;* and *Victoire*. M. Reyer wrote for the *Presse*, the *Revue de Paris* and *Courrier de Paris*; and after the death of Berlioz, he became musical critic to the *Journal des Débats*.

REYKJAVIK. See ICELAND, Vol. XII, p. 654.

REYNARD THE FOX. See FABLE, Vol. VIII, p. 734.

REYNOLDS, SIR J. RUSSELL, an English physician; born in Romsey in 1828. He was educated at University College, London, and the University of London; was elected fellow of University College in 1856, of the Royal College of Physicians in 1859, and of the Royal Society in 1869; was appointed professor of principles and practice of medicine in University College in 1865; member of the council in 1888; was *emeritus* professor of medicine in University College, and consulting-physician to University College Hospital, and from 1878 until his death physician in ordinary to the Queen's household. He wrote *Essay on Vertigo* (1854); *Diagnosis of Diseases of the Brain, Spinal Cord and Nerves; Facts and Laws of Life* (1859); and *Lectures on the Clinical Uses of Electricity* (1871); besides numerous magazine articles and lectures; he was made a baronet in 1895; was president of the Royal

College of Physicians, and in 1895 president of the British Medical Association. He died May 29, 1896.

REYNOLDS, John Fulton, soldier, was born at Lancaster, Penn., on September 20, 1820, and was graduated from West Point in 1841, being assigned to the artillery corps. In the Mexican War he served under General Taylor, and won promotion at Monterey and Buena Vista. He served in Oregon and Utah, and in 1860–61 was commandant at West Point. In the Civil War he commanded Pennsylvania volunteers in the Peninsular campaign until the battle of Glendale, on June 30, 1862, when he was captured. Six weeks later he was released by exchange, and then served at the second battle of Bull Run, where only his personal gallantry kept the defeat from becoming a rout. He commanded the Pennsylvania militia when Lee invaded that state. He was held in reserve at Chancellorsville, though he asked to be sent to the front. On July 1, 1863, he hastened with his corps to Gettysburg to head off Lee, selected the position upon which the Federal army won its victory, and was killed at the head of his troops at the beginning of the battle. W.F.J.

GEN. J. F. REYNOLDS.

REZONVILLE, Battle of. See Gravelotte, in these Supplements.

RHACHITIS, the technical name for Rickets, Vol. XX, pp. 562–563.

RHÆTO-ROMANIC DIALECTS, same as Ladino. See Romance Languages, Vol. XX, p. 686.

RHAMPHASTIDÆ or RAMPHESTES. See Toucan, Vol. XXIII, pp. 506–507.

RHAPSODISTS. See Greece, XI, 122, 123.

RHATANY, the name of a drug obtained from the root of certain South American species of *Krameria*, an anomalous genus sometimes placed in the family *Polygalaceæ*, sometimes in the family *Leguminosæ*, and sometimes made to constitute a family of its own, the *Krameriaceæ*. The medicinal principle is a tannin; useful as an astringent.

RHEA. See Cybele, Vol. VI, p. 657.

RHEA, the stage name of Hortense Barbe Loret, a Belgian actress; born in Brussels in 1845. Early in life she made the acquaintance of Charles Fechter, who placed her in the care of Samson, the famous instructor of Rachel. Through his influence she was permitted to study under Beauvollet in the Paris Conservatoire. For ten years she attained success in France, and in 1881 visited the United States, playing first in Boston. Her chief success was in tragedy, in *Adrienne Lecouvreur*. Died in Montmorency, France, about May 8, 1899.

RHEA SILVIA. See Romulus, Vol. XX, p. 840.

RHEINBERGER, Joseph, a German musician; born at Vaduz, in Liechtenstein, March 17, 1839; studied at the Conservatory of Munich, at which institution he, from 1855–1901, taught piano, counterpoint, and composition. In 1855 he was appointed court kapellmeister. He died at Munich, Nov. 25, 1901. Among his compositions are pieces for the piano, organ, stringed instruments, songs, ballads, choruses; the symphonic poem *Wallenstein;* the *Florentinische Sinfonie;* a requiem; a mass for two choruses; the operas Türmer's *Töchterlein*, *Die Sieben Raben; Die Legende Christophorus; Die Rheinsage Montfort*, and the oratorio *Der Stern von Bethlehem.* G.A.S.

RHENISH WINES or RHINE WINES. See Wine, Vol. XXIV, pp. 635–643.

RHETT, Robert Barnwell, statesman, was born at Beaufort, S. C., on December 24, 1800. His real name was Smith, but he changed it in 1837 to Rhett, in memory of a Revolutionary ancestor. He entered the South Carolina legislature in 1826, and became a leader of the "Nullification" party. In 1832 he was attorney-general of the state, and in 1837–49 was a representative in Congress, where he was the first southerner to propose or suggest dissolution of the Union. He entered the U. S. Senate in 1851, and urged the immediate secession of South Carolina, but when the state declined to adopt his suggestion he resigned his senatorship in disgust and retired to private life, in 1852. He was a prominent member of the Confederate Congress, was a delegate to the Democratic National Convention of 1868, and died on Sept. 14, 1876. W.F.J.

RHEUM. See Rhubarb, Vol. XX, p. 544.

RHIND, J. Massey, a Scotch sculptor; born near Edinburgh; descended from a line of famous Scotch sculptors and artists; studied under Delau in Paris. He early developed great talent, receiving in one year at the South Kensington three gold medals. He removed to America in 1889, and immediately attracted attention. His designs show great originality, accuracy and taste. Among his works in the United States the principal are the bronze doors of Trinity Church, New York; the façade at the entrance of the American Surety Building, New York; the Rufus King memorial fountain, Albany; and the entrance ornamentation for Alexander Commencement Hall of Princeton University. In 1896 he completed a colossal statue of John Calhoun for the state of North Carolina.

RHINEBECK, a village of Dutchess County, southeastern New York, 16 miles above Poughkeepsie, on the Philadelphia, Reading and New England railroad, and near the Hudson River. It is a stock-raising and farming center, has a brisk trade, and manufactures wagons and carriages. It has good schools, a bank, several churches, and newspapers. Population 1890, 1,649; 1900, 1,494.

RHINELANDER, a village and the capital of Oneida County, central northern Wisconsin, 65 miles N.E. of Wausau, on the Wisconsin River, and the Chicago and Northwestern and the Minneapolis, St. Paul and Sault Ste. Marie railroads. It is surrounded by great pine forests, and manufactures lumber, wagons, staves, and has turning-works,

foundry and machine-shop. Population 1890, 2,658; 1900, 4,998.

RHINOCEROTIDÆ. See RHINOCEROS, Vol. XX, p. 535.

RHIZOCARPEÆ, the old family name of the *Hydropterideæ*, or water-ferns, a small group of aquatic Pteridophytes, comprising the genera *Salvinia*, *Azolla*, *Marsilia* and *Pilularia*.

RHIZOCEPHALA. See CRUSTACEA, Vol. VI, pp. 576–577.

RHIZOME. See BOTANY, Vol. IV, p. 87.

RHIZOPODA. See FORAMINIFERA, Vol. IX, p. 325.

RHODE ISLAND had a population of 428,556 in 1900, that of 1890 having been 345,506, the gain

STATE SEAL OF RHODE ISLAND.

constituting an increase of 24.0 per cent. The twelfth decennial census showed 10 cities within the state with a population of 8,000 or over, in which resided 347,892 of the people of the state, giving an urban population of 82.2 per cent. In 1880 there were six cities of the size mentioned, in which 175,500 persons lived, the urban population at that time being 63.46 per cent of the whole. At both dates this state had the largest percentage of urban inhabitants. The rank among the states in 1900 was that of 35, that in 1890 was 34. The density (1900) of population was 407.0 to the square mile, another item in which Rhode Island led all the states. The number of males was 210,516, the number of females 218,040; the percentage of native-born population was 68.6; the number of negroes 9,092, an increase of 1,699 since 1890; the Chinese numbered 366, the Japanese 13, and the civilized Indians 35. A census taken in 1895, by state authority, gave the population at 384,758, an increase since 1885 of 80,474, or 26.45 per cent.

The latest corrected surveys of Rhode Island give the gross area as 1,247 square miles, of which 194 square miles are water area.

In the acreage devoted to the cultivation of the cereals, Rhode Island stood last among the states and territories, with 10,552 acres, the production being 350,110 bushels. Of the total area, 61.76 per cent was under corn, 0.09 under wheat, 28.81 under oats, 2.87 under barley, 6.15 under rye and 0.32 under buckwheat. The acreage and production of the above mentioned crops for the year 1899 are given in the following table:

GRAIN.	ACRES.	BUSHELS.
Corn	8,149	288,220
Wheat	15	310
Oats	1,530	47,120
Barley	222	6,100
Rye	591	7,710
Buckwheat	45	650

The acreage under corn in 1899, according to the state census of that year, was 8,149, the production 288,220 bushels. The same authority gives the area under oats at 1,530 acres, the production 47,120 bushels. Other agricultural items of the census are as follows: Value of the horses (1900) on farms, $976,208; of the cows, $975,143; of the sheep and lambs, $41,282; of the hogs, $90,614; of the oxen and other cattle, $190,757; value of the oats crop of 1899, $16,631; of the corn crop, $164,138; of hay and forage, $1,081,482.

Manufacturing industries increased largely in Rhode Island within the decade ending with 1890, but the number of farms and the area devoted to farming was much decreased. In 1895 a state census was taken, which showed the number of abandoned farms to be, at that time, 419, with an acreage of 36,811, and of an assessed valuation of $383,250.

The latest complete statistics on manufacturing are those of the decennial census for 1900, which show Rhode Island to have had 4,189 specified manufacturing industries, which utilized $183,784,587 capital and which furnished employment to 96,528 persons, who received as annual wages the sum of $41,114,084. The estimated cost of the materials used was $96,392,720 and the value of the finished products $184,074,378. The principal line was that of cotton goods, which yielded products of the value of $26,435,675. Next in importance came worsted goods, $33,341,329; foundry and machine-shop products, $13,269,086; woolen goods, $5,330,550; and jewelry, $13,320,620. Other lines of importance were: clothing, all lines, which aggregated $1,640,734; dyeing and finishing textiles, $8,484,878; hosiery and knit goods, $2,713,850; masonry, brick and stone, $3,383,123; and slaughtering and meat-packing at wholesale, $2,410,466. The manufacture of shoddy yielded a return of $515,643, rubber goods, $2,518,268, and silverware $3,834,408.

Rhode Island stood 13 in the order of the value of fisheries in 1889, the total product amounting in value to the sum of $1,160,454. The aggregate capital invested was $1,042,072; the number of persons employed, 1,745 fishermen and 469 shoremen; the vessels numbered 110, the boats 1,320. The leading branch of the industry was the menhaden fishery, with a total value of $508,342. The inland fisheries of the state are under the control of a commission of five members appointed by the governor, and the shell fisheries are regulated by a commission of six members appointed in like manner.

At the beginning of 1899 there were six state banks in Rhode Island, whose resources and liabilities amounted to $1,983,706. At the same time there were 45 national banks doing business within the state, with a total capital stock of nearly 15 million dollars. The clearings of the national banks for 1895 amounted to $290,908,500. There were also 29 savings banks, the combined deposits amounting in 1900 to $73,489,533, belonging to 142,096 depositors, the average amount to the credit of each depositor being $502.40. The trust companies numbered eight, their cash capital amounting to $2,808,635.

In 1900 the railroad commissioner of Rhode Isi-

and reported the entire railroad mileage of the state at 683 miles. This included both steam and electric roads, of which the former had about two-thirds of the mileage. The net earnings of all lines during 1900 amounted to $7,586,145. The state has large interests invested in steamships and sailing-vessels. The tonnage of the port of Providence in 1895 was 8,456 sail, and 18,415 steam. The vessels arriving at the city from foreign ports numbered 102 during the same year. Many lines of steamships connect Providence with other ports of Rhode Island and with New York, Boston, Philadelphia, Norfolk and Baltimore.

The charitable institutions of the state include the Soldiers' Home, in the town of Bristol, to which the state contributed in 1895 $27,037; Butler Hospital for the Insane, which had 183 patients at the close of 1895, partially supported by the state and partially by the interest from almost $300,000 invested funds; the State School for the Deaf, with 60 pupils during 1895, costing the state during the same year $13,428; the State Home and School for Children, in the city of Providence, with 106 children in attendance at the close of 1895, to which the state appropriated $19,032 during the year; and the Rhode Island School of Design, in Providence, 107 pupils in attendance at the beginning of 1896, and about $3,000 contributed by the state for the preceding year.

The total expenditure for public education in Rhode Island in 1899 amounted to $1,570,895, of which

CAPITOL BUILDING, PROVIDENCE.

$470,945 was drawn from the state treasury and $1,236,516 was from city, town and district treasuries. In 1899 the children between the ages of 5 and 16 years numbered 79,825, of whom 64,537 were enrolled in the public schools. Eleven thousand and twenty-five attended Catholic schools; 1,307 attended select schools; and only 9,735 children within the school age were reported as not attending some school. The number of graded schools was 1,098, the number of ungraded 246, the total number of schools 1,344. In 1899 the average length of the school terms was 9 months and 9 days. The male teachers numbered 372, female teachers 1,548. The total wages paid to teachers was $998,315, the average monthly wages of male teachers being $101.83, of female teachers $50.06. The number of high schools was 18, in which 3,436 pupils were enrolled, and from which 366 pupils were graduated during the year. Evening schools to the number of 61 were maintained, in which 7,974 pupils were enrolled, the expenses of all kinds aggregating $46,971. The free public libraries of the state numbered 50, to which the state awarded $5,653 during the year. The total number of volumes was 247,233 and the number of patrons 53,303. The following table shows the amount appropriated by the state during 1895 for educational purposes, other than the public schools:

For the State Normal School	$ 18,999
For the State Home and School	20,462
For the Rhode Island School of Design	1,537
For the Rhode Island Agricultural College	10,000
For teachers' institutes, lectures, addresses, etc.	298
For site and building for the State Normal School,	197,515
For sites, buildings and furniture for schools	267,085
For apparatus and books of reference	15,651
For mileage for pupils of the State Normal School,	2,000

Rhode Island had, in 1901, 412 church organizations, 280 edifices, a total membership of 148,008, which constituted 42.84 per cent of the entire population. The value of the church property of the state was estimated at $7,583,110. The Adventists had 21 organizations; all Baptist bodies, 113; Roman Catholics, 51; Congregationalists, 34; all Methodist bodies, 52; and Protestant Episcopal, 50. In all, 34 different denominations were represented.

The following table relative to the finances of the state is compiled from the report of the state treasurer for 1895:

	Real Estate.	Personalty.	Total.
Whole state, 1894-	$295,604,735	$85,530,316	$381,135,051
Whole state, 1895-	283,427,125	85,938,543	369,365,668
Dec. dur'g the year	$ 12,177,610	$ 408,227	$ 11,769,383

Total receipts of the state treasurer for 1900	$ 1,518,538
Total payments of the state treasurer for 1895,	1,302,940
Total indebtedness of the cities of the state, 1895,	21,813,353
Total indebtedness of the towns of the state, 1895	23,540,818
Total indebtedness of the state 1901 (funded).	2,300,000

The state institutions, with the exception of those already mentioned, are located on a farm of 538 acres, about seven miles from the city of Providence, and comprise the following institutions, having the number of inmates given at the beginning of 1896:

	Males.	Females.	Total.
State Workhouse and House of Correction	177	85	262
State Asylum for the Insane	313	316	629
State Reform School	249	28	277
State Prison	151	2	153
Providence County Jail	260	26	286
State Almshouse (including 26 boys and 19 girls)	158	156	314

For the support of the state institutions at Cranston there was appropriated for 1895 the sum of $259,079.

At the beginning of 1896 the Rhode Island Military Department was made up of the following: General and staff officers, 29; other commissioned officers, 144; enlisted men—cavalry, 95; artillery, 86; naval battalion, 108; infantry and heavy ar-

illery, 965: making a total of 1,427. Included in the above were independent organizations numbering 50 officers and 289 enlisted men, a total of 339. Deducting these from the total military force, as above, leaves the National Guard with a strength of 1,088. The state appropriation of 1894 was $104,000; the Federal, mostly in arms, equipments and accouterments, $3,450.

March 30, 1905, there were published in Rhode Island 58 newspapers and other periodicals, of which 13 were daily, 3 semiweekly, 29 weekly, 2 semimonthly, 10 monthly, and 1 bimonthly. Papers were published in all the 5 counties of the state, and in 17 of the cities, towns, and villages, of which 4 were county seats.

The following table gives the population of the principal cities of Rhode Island for 1890 and 1900:

City.	1890.	1900.
Providence	132,146	175,597
Pawtucket	27,633	39,231
Woonsocket	20,830	28,204
Lincoln	20,355	8,937
Newport	19,457	22,034
Warwick	17,761	21,316
Central Falls	.....	18,167
Johnston	9,778	4,305
Cranston	8,099	13,343
Cumberland	8,090	8,925
Westerly	6,813	7,541
Burrillville	5,492	6,317
Bristol	5,478	6,901
Coventry	5,068	5,279

State flower, Violet.

The following is a list of the governors of Rhode Island, with their respective terms of office:

Arthur Fenner	1790–1805	William Sprague	1860–63
Henry Smith	1805–06	William C. Cozzens	1863
Isaac Wilbur	1806–07	James Y. Smith	1863–66
James Fenner	1807–11	Ambrose E. Burnside	1866–69
William Jones	1811–17	Seth Padelford	1869–73
Nehemiah R. Knight	1817–21	Henry Howard	1873–75
William C. Gibbs	1821–24	Henry Lippitt	1875–77
James Fenner	1824–31	Charles C. Van Zandt	1877–80
Lemuel H. Arnold	1831–33	Alfred H. Littlefield	1880–83
John B. Francis	1833–38	Augustus O. Bourn	1883–85
William Sprague	1838–39	George P. Wetmore	1885–87
Samuel W. King	1839–43	John W. Davis	1887–88
James Fenner	1843–45	Royal C. Taft	1888–89
Charles Jackson	1845–46	Herbert W. Ladd	1889
Byron Diman	1846–47	John W. Davis	1889–91
Elisha Harris	1847–49	Herbert W. Ladd	1891–92
Henry B. Anthony	1849–51	D. Russell Brown	1892–95
Philip Allen	1851–52	C. W. Lippitt	1895–97
William B. Lawrence	1852	Elisha Dyer	1897–1900
Philip Allen	1852–53	William Gregory	1900–01
Francis M. Dimond	1853–54	C. D. Kimball	1901–03
William Hoppin	1854–57	Lucius F. Garvin	1903–05
Elisha Dyer	1857–59	George H. Utter	1905–07
Thomas G. Turner	1859–60	James H. Higgins	1907–

See Rhode Island, Vol. XX, pp. 538–539.

RHODES, Rt. Hon. Cecil John, P.C., D. C. L., an English colonial statesman whose ability has won for him the title of the Napoleon of Africa, was born at Bishop Stortford, Hertfordshire, England, July 5, 1853. His grandfather was a well-to-do dairyman in the Islington suburb of London, to whom tradition assigns 999 head of cattle and the inability to possess an even 1,000. His father, the Rev. Francis William Rhodes, was for many years vicar of St. Michael's Church in the parish of Bishop's Stortford, where a stained-glass window commemorates the esteem in which the villagers held a benign man, with a remarkable virtue for ten-minute sermons. Cecil, the third son, a weekly youth, received his early education at the local grammar-school, one of King Edward VI's foundation, as did his numerous brothers, of whom one died in the heart of Africa and others did honor to the rolls of the English army. A term or two at Oriel College, Oxford, followed, and then physicians ordered him to the Cape. He landed with moderate means and took to diamond-mining, ultimately consolidating all the mining interests and controlling the diamond supply of Africa. The warm African climate had made a mountain of energy of a weedy English youth. Cape politics soon attracted him. He entered the colonial Parliament as member for West Barkly and later took office in the ministry of Sir Thomas Scanlon. On the fall of Sir Gordon Sprigg's Ministry, July 17, 1890, he became Premier of the colony. In 1891 he visited England, and while there donated $50,000 to the Irish Home Rule fund. In September, 1893, he took the field against Lobenguela, the warlike king of Matabeleland, with a flying squadron of 600 troopers. In vain did the fearless impis of fierce Matabeles charge the moving square. The Maxim, Gardner and Nordenfeldt machine-guns made as short work of these warlike Naboths as the white gold-seekers did of their vineyards. Charges of slaughtering surrendered prisoners were freely brought against the irregular troops of the Chartered South African Company composing the force. Toward Equatoria they marched, and slaughtered savages as they went. Rhodes had set his mind on a telegraph-line, if not a railroad, to Cairo. Lobenguela tersely called him "The man who eats a country for breakfast," and Lobenguela's kraal at Buluwayo was made the new capital of Rhodesia very soon after Rhodes marched into the land. Loyal to the crown, his deeds and his utterances marked him as a man too imperial for a crown to rule. England began to conciliate this political meteor, who added more to the empire's bounds in a month than armies had won in a century. He was called home and sworn of the Privy Council. But the drawing-rooms of Belgravia were too small a world for the man whose breathing-space was the great Karroo Desert, and thither he returned.

C. J. RHODES.

In the African Hinterland gold-fields were on every hand, and the soil was a second Eden in fertility. Then came the Uitlander agitation in Johannesburg, led by his brother, Colonel Francis W. Rhodes. Of the Cape Premier's knowledge of all

the proceedings, no one questions. None knew better than he that a conflict was bound to come between a majority of Anglo-Saxons deprived of the franchise and a Boer oligarchy. His policy had been Fabian in tactics, but his impetuous lieutenant, Dr. L. S. Jameson (q.v., in these Supplements), flew across the Transvaal border, with results that brought the secret policy of South African administration into notoriety. Rhodes's attitude may be accounted for by his knowledge of Boer intrigues with Germany, but the fact remains of his complicity in the Jameson raid. Resigning from the Cape government and again visiting Downing Street, he hurried back to quell an extensive Matabele revolt and then sat down to assist in administering the government of the land which bears his name. "His aim," as a keen critic said, "is nothing less than the erection of a real British Empire with home rule for all the parts, with an equal citizenship throughout, and with full representation of all the British regions in the central governing bodies. In that case, South Africa would take her place with Australia, Canada and the rest, and all British soil would be deemed equally sacred. This idea entertained by Mr. Rhodes is the only hope for the permanence of the political affiliation of those regions now pertaining to the British crown and known as the 'British Empire.' Other men hold this conception and are working for its realization; but Mr. Rhodes, both in ability and in virtue of his actual place in imperial affairs, stands head and shoulders above them all."—His elder brother, FRANCIS WILLIAM RHODES, was a dashing cavalry officer, a trusted aide of the present commander-in-chief, Lord Wolseley. He saw sharp service in Egypt, was aide-de-camp to a Lord-Lieutenant in Ireland, and then, magnetically attracted to his brother's star rising in Africa, though colonel commanding the First (Royal) Dragoons, he went to Johannesburg to superintend mining interests there. He took a leading part in the insurrectionary movement, and enrolled the Uitlanders against the Boers. On the fiasco of Jameson's raid, he, with others, was arrested and tried before an Orange Free State judge and sentenced to death. The punishment was at once commuted to a fine of $125,000, brief imprisonment and banishment in default of abjuring civil rights. Colonel Rhodes then left the Transvaal.

Early in 1897 Mr. Cecil Rhodes went to England, where, despite the Jameson Raid, he received a popular ovation. A select committee of Parliament, however, censured him for aiding the reform movement among the Uitlanders of the Transvaal, though Mr. Rhodes affirmed that Jameson went armed into the burgher republic without his authority. Mr. Chamberlain, nevertheless, could say that, "Although Mr. Rhodes had committed as great a fault as a statesman could commit, nothing had been proven, and there existed nothing against his personal character as a man of honor." In June, '97, Mr. Rhodes returned to South Africa, and after negotiating for peace with some native chiefs who had been fighting in Mashonaland he resumed his labors on behalf of the chartered territories (Rhodesia), north and west of the Transvaal. When war with the Boer republics broke out (Oct., 1899), he went to Kimberley, the seat of the De Beers diamond mines, and remained there during its long investment by the Boers. While there he did much to stiffen the defence until relief came and the siege was raised (Feb., 1900). At his own expense, he raised and equipped a force of 400 men for the defence of the beleaguered town. Died at Cape Town, Mch. 25, 1902.

RHODESIA, an English possession, extending from the Transvaal to the Congo Free State and German East-Africa, is divided by the Zambesi into Southern Rhodesia, Northwestern and Northeastern Rhodesia. Southern Rhodesia is administrated by a Resident Commissioner and a Legislative and Executive Council, has an area of about 144,000 square miles and is divided into Matabeleland and Mashonaland. The principal towns are Salisbury (capital), and Bulawayo. The goldfields with an area of 5,250 square miles are worked by 300 syndicates. The output from 1890–1907 was 2,601,830 ounces. Other minerals like silver, copper, lead, etc., have been discovered. In southern Rhodesia there are over 3,000 miles of railroads. The line from Vryburg to Bulawayo, has been open since 1897, from there to Wankie, since 1903, reaching Victoria Falls in 1904. The river is crossed there by a bridge 650 feet long and 30 feet wide, and 420 feet above the water. It was opened on Sept. 12, 1905. The railway reached Kalomo in 1905, and Brocken Hill Mine in 1906, 374 miles north of the Zambesi River, a distance of more than 2,000 miles from Cape Town, effecting that town, a through railway communication. In 1908, a London syndicate with a paid-up capital of $15,000,000 was formed which plans to harness and to transmit the enormous force of the Zambesi (estimated at 35,000,000 horse-power) by wire not only to the Transvaal but everywhere within a radius of 600 miles from this point.

RHUS, a genus of plants of the family *Anacardiaceæ*, commonly known as sumachs. They are shrubs or trees, with ample terminal or axillary panicles of small flowers, mostly compound leaves and dry or berry-like fruit. Besides the various well-known sumachs, the genus contains the smoke-tree (*R. cotinus*), poison ivy (*R. toxicodendron*), and poison sumach (*R. venenata*). See JAPANNING, Vol. XIII, p. 603.

RHYS, JOHN, a British philologist; born near Ponterwyd, in Cardiganshire, June 21, 1840; after a course at Bangor Normal College he entered Jesus College, Oxford. He was elected to a fellowship at Merton in 1869, and next continued his studies at the Sorbonne, Heidelberg, Leipsic and Göttingen, returning in 1871 to become inspector of schools for Flint and Denbigh. In 1877 he was appointed professor of Celtic in the University of Oxford, and in 1881 was elected to a fellowship at Jesus College. His *Lectures on Welsh Philology* (1877), and *Celtic Britain* (1882), confirmed the reputation for erudition which he had already gained by his contributions to Kuhn's *Beiträge zur Vergl. Sprachforschung*.

the *Revue Celtique*, and the *Archæologia Cambrensis*. He gave the Hibbert lectures on *Celtic Heathendom* in 1886; at the close of 1889 the Rhind lectures on *The Early Ethnology of the British Isles*, at Edinburgh; in 1891 he published *Studies in the Arthurian Legends;* and in 1892 *Inscriptions and Languages of the Northern Picts*.

RIAZAN. See RYAZAN, a town in Russia. See Vol. XXI, p. 124.

RIBALTA, FRANCISCO, a Spanish artist; born in Castillon de la Plana, in 1551. He studied at Valencia, and later at Rome. His first work on his return home was *Cura*, for Corpus Christi College. His coloring was rather harsh. He was a good draftsman, and knew anatomy thoroughly. His pictures are in churches in all the larger cities of Spain. He died in Madrid, Jan. 12, 1628.

RIBBECK, JOHANN KARL OTTO, a German philologist; born in Erfurt, in 1827. In 1859 he was made professor of ancient languages in the University of Berne; in 1862, at Kiel; in 1872, at Heidelberg, and in 1877, at Leipsic. His chief publications are *Scenicæ Romanorum Poesis Fragmenta; Die Römische Tragödie im Zeitalter der Republik* (1875); *Biography of Friedrich Ritschl* (1881); and *Geschichte der Römischen Dichtkunst*. He also edited a critical edition of *Virgil*. He died in 1898.

RIBEIRO, BERNARDIM. See PORTUGAL, Vol. XIX, p. 571.

RIBOT, ALEXANDER FÉLIX JOSEPH, a French lawyer and statesman; born at St. Omer, Feb. 7, 1842. He studied law in Paris, and was first secretary of the bar society in 1870; in 1875 appointed Director of Criminal Affairs and Pardons; in 1878 was elected to the Chamber from the second circumscription of Bologne-sur-Mer, and became one of the leaders of the moderate republican element; was re-elected in 1881; in 1886 failed to obtain re-election, and retired from public life until 1887, when he was returned from Pas-de-Calais; in 1889 from the circumscription of St. Omer; held the portfolio of Foreign Affairs in M. Freycinet's cabinet in 1890 and retained it in M. Louvet's administration. Upon the fall of the Louvet government on account of the Panama scandals, M. Ribot became president of the cabinet (January, 1893), and Minister of the Interior. His government was overthrown in March, 1893. In January, 1895, upon the election of Faure to the Presidency, M. Ribot was again made Premier, and remained in office until the October following, when he was susperseded by M. Bourgeois. M. Ribot was always a moderate republican. He was one of the strongest opponents of General Boulanger's schemes.

RIBOT, AUGUSTIN THEODULE, artist; was born in the Department of Eure, France, on August 8, 1823, and studied under Glaize in Paris. He won a medal of the third class at the Universal Exposition of 1878, and was decorated with the Legion of Honor. He excelled in painting religious scenes and portraits, and a number of his works are in public galleries. He died on September 11, 1891. W.F.J.

RIBOT, THÉODULE ARMAND. See EVOLUTION, Vol. VIII, p. 671.

RIBS. See ANATOMY, Vol. I, p. 659.

RICASOLI, BARON BETTINO, statesman; was born at Florence, Italy, on March 9, 1809, and was educated at Pisa and Florence. He became much interested in scientific agriculture, and did a great work for Italy in that department of industry. He was the author of valuable books on the cultivation of grapes, olives and mulberries, and for ten years worked with much success at the drainage and reclamation of the Tuscan Maremma. In 1859 he became the leader of the party opposed to the then grand duke of Tuscany, and, upon the flight of the latter, was made for a time dictator of the Duchy. He then joined Victor Emmanuel in his efforts for Italian unity, and was appointed by that king as governor of Tuscany. Upon the death of Cavour, in 1861, he was made prime minister, but a year later was constrained to resign because of the hostile intrigues of Rattazzi. He was recalled to office in June, 1866, but once more resigned in April of the following year, and then retired wholly and permanently from public life. He continued his interest in agricultural industry to the end of his life, and by example and instruction did a greater work than most men of his time for the rehabilitation of his country. He died at Rome on October 23, 1880, and his *Letters and Papers* were published in 1886–89. W.F.J.

RICCI, LUIGI, soldier and educator; was born in Italy, and was educated at Padua. He served with Garibaldi in 1866, and fought in the French army in 1870–71. Since 1871 he has lived in London, where he is a teacher in the University of London, a professor in King's College, etc., and the author of a number of Italian and other text-books. W.F.J.

RICE, INDIAN, WATER-RICE, OR WILD RICE, common names of *Zizania aquatica*, a common water-grass of the central and western United States. It is tall and reed-like, with large leaves, an ample terminal panicle, and slender grains, collected for food by the Indians.

RICE, ALLEN THORNDIKE, editor; was born in Boston, Massachusetts, on June 18, 1853, spent much of his boyhood abroad, and was educated at Oxford and at the Columbia College law school. In 1876 he purchased *The North American Review* and completely transformed it, giving it vastly increased popular interest and an extended circulation. In 1879 he organized the Charnay expedition, to investigate archæological remains in Mexico and Central America. In 1884 he became proprietor of *Le Matin* newspaper, of Paris; in 1886 was a candidate for Congress but was defeated; and in 1887 was one of the leaders in the ballot reform movement. He was appointed Minister to Russia by President Harrison in March, 1889, but died on May 16 following. He edited *Reminiscences of Abraham Lincoln* (1866), and contributed to *Ancient Cities of the New World* (1887). W.F.J.

RICE-BIRD, a name used in the rice-growing regions of North America for the bobolink (*Dolichonyx*). The bird passes the winter in the Southern

states and adjacent islands. In the spring it migrates far north, and is generally known as the bobolink. In Pennsylvania it is called reed-bird. In the autumn it returns to the South, and feeding upon the rice, becomes fat, and is esteemed as a table delicacy.

RICHARDS, T. Addison, artist and author, was born in London on December 3, 1820, and came to New York in 1831. The next year he wrote an illustrated story of his voyage. Beginning at the age of eighteen, he wrote much for publication, illustrating his own books and articles, and for many years was a constant contributor of illustrations, of landscapes and other pictures, to *Harper's Magazine* and other periodicals. In 1858 he became the principal of the women's school of design at the Cooper Institute, New York. He was president of the New York Sketch Club, a founder of the Artists' Fund Society, and in 1851 was elected to the National Academy of Design. He was made professor of art in New York University in 1867 and filled the place for twenty-five years, and thereafter was emeritus professor. He is best known for his landscapes, which hold a high place in American art. He died in New York on June 30, 1900. W.F.J.

RICHARDS, William Trost, artist, was born in Philadelphia on November 14, 1833, and was educated in the high school of that city. He studied art in Florence, Rome and Paris, and thereafter made several visits to Europe for painting and exhibition of his works. For many years he had his studio in Philadelphia, but later removed to Newport, R. I. Examples of his work are to be seen in the Metropolitan Museum of Art, New York; the Pennsylvania Academy of Fine Arts, Philadelphia; the Corcoran Gallery, Washington, D. C.; and the Schauge Gallery, Hamburg. He received a medal at the Centennial Exposition at Philadelphia in 1876, a medal at the Paris Exposition of 1889, and the Temple medal of the Philadelphia Academy of Fine Arts. He was elected many years ago a member of the National Academy, and of the American Water-Color Society. Died Nov. 8, 1905. W.F.J.

RICHARDSON, Sir Benjamin Ward, physician; was born in 1828 at Somerby, Leicestershire. Destined for the medical profession, he entered Anderson's College, Glasgow, and when his work was interrupted by sickness he became assistant to various practitioners. In 1854 he was admitted M.A. and M.D. of St. Andrews, and 1856 became a member of the Royal College of London, where he lectured on *materia medica*. He lived at Mortlake, where he met Thackeray, Jerrold, Hepworth Dixon, and others well known in literature. Settling in London he became physician to various dispensaries, the Press Fund and Literary Fund, besides lecturing on forensic medicine and hygiene as well as physiology. He won the Fothergillian Gold Medal in 1854, the Astley Cooper prize of 300 guineas in 1856. In 1875 he delivered at Brighton a powerful address, *Hygeia*, to point out the value of sanitation. In the same year he lectured on *Alcohol*, which he considered so powerful a drug as to be useful only in an emergency. He introduced fourteen anæsthetics, among them methyline bichloride, and was assiduous in inventing means to relieve pain and lengthen human life. His inventions include a double valve inhaler for chloroform, an ether spray tube, and a mask for workers in dust. He discovered the controlling influence of nitrite of amyl over tetanus. He was among the first to recommend the bicycle. He was the originator and editor of the *Journal of Public Health*. His scientific articles were very numerous, but he found time to write biographies, plays, poems and songs. At the time of his death, in 1896, he was engaged upon a book called *Vita Medica*, chapters of medical life and work. The *Asclepiad* contains researches of a similar character. W.R.B.

RICHARDSON, Charles Francis, educator, was born at Hallowell, Maine, on May 29, 1851, and was graduated from Dartmouth College in 1871. He was on the editorial staff of the New York *Independent* in 1872–78, and of the *Sunday-School Times* in 1878–80, and was editor of *Good Literature* in 1880–82. Since 1882 he has been professor of English in Dartmouth College. He has written *A Primer of American Literature*, *The College Book*, *The Cross* (poems), *The Choice of Books*, *American Literature*, *The End of the Beginning* (a romance), and other works. W.F.J.

RICHARDSON, Henry Hobson, architect, was born in Louisiana, on September 29, 1838, and was graduated from Harvard College in 1859. He became an architect, and after some years' practice was graduated from the École des Beaux Arts in Paris. Among his early works were a church, a bank, and a railroad station, which gave small promise of his later genius. In time, however, he developed into one of the foremost architects of America and indeed of the world in his time. Among his works are the noble tower of the Brattle Street Church in Boston, Sever Hall and Austin Hall at Harvard University, the State Capitol at Albany, N. Y., the public buildings of Allegheny County, Penn., the Chamber of Commerce at Cincinnati, the Ames Memorial Hall at North Easton, Mass., and the Craig Memorial Library at Quincy, Mass. His masterpiece, however, is Trinity Protestant Episcopal Church, in Boston, which he designed at the close of his life, while suffering from a mortal disease, and which he did not live to see completed. He died at Brookline, Mass., on April 28, 1886. (See Architecture in these Supplements.) W.F.J.

H. H. RICHARDSON.

RICHARDSON, James Daniel, lawyer and legislator, was born in Tennessee on March 10,

1843, and was a soldier in the Confederate army. After the war he became a lawyer, was a member and speaker of the House, in the Tennessee legislature in 1871–72, and State Senator in 1873–74. Since 1885 he has been a representative in Congress. W.F.J.

RICHARDSON, William Adams, jurist and financier, was born at Tyngsborough, Mass., on November 2, 1821, and was graduated from Harvard College in 1843, and from the Harvard Law School in 1846. He soon rose to prominence at the bar, and was entrusted with the revision of the statutes of Massachusetts in 1855–59. He was made judge of probate in 1856, and judge of probate and insolvency in 1858. This office he held until 1872, when he resigned it to perform the duties of assistant-secretary of the U. S. Treasury, to which office he had been appointed in 1869. He was fiscal agent of the treasury in Europe, and managed the delivery in London of $130,000,000 in United States bonds. In March, 1873, he succeeded George S. Boutwell as Secretary of the Treasury, and skilfully managed the transfer of the $15,000,000 of the Geneva award, payable in gold, from England to America without any disturbance of the money market. In the financial panic of 1873 he scrupulously kept the treasury from embarrassment, and he resigned the treasury portfolio in 1874 with the reputation of a sound and able financier. He was made a judge of the court of claims at Washington in 1874, and chief justice of that court in 1885. He was a lecturer in the law school of Georgetown University for some years after 1881. He died on October 19, 1896. W.F.J.

RICHARDT, Christian Ernst (1831–93). See Denmark, Vol. VII, p. 82.

RICHELIEU, a river and canal. See St. Lawrence, Vol. XXI, p. 190.

RICHEPIN, Jean, a French poet and novelist; born in Médéah, Algeria, Feb. 4, 1849, where his father was army surgeon. He was educated at the lycées Napoleon and Charlemagne, in Paris; began the study of medicine, and in 1868 entered the Normal School in the department of letters. During the Franco-Prussian War he was editor of *L'Est* in Franche Comté, returned to Paris and published the novel, *Jules Vallès* (1872), and the drama *L'Étoile*, written in collaboration with André Gill; in 1876 was imprisoned and fined for publishing his *Chanson des Gueux;* after being liberated was a sailor for a time, and then returned to Paris, became editor of the *Gil Blas*, and devoted himself entirely to literature. M. Richepin, in prose and verse, is one of the most prominent representatives of the realistic or naturalistic schools of Paris, and, faithful to its principles, had no regard for conventionalities, literary, moral or social. His works have been often attacked and frequently suppressed. His poems, however, which are mostly lyrics, are bold and graceful, and all his work bears the stamp of individuality. Among his poetry might be mentioned *Les Caresses* (1877); *Les Blasphèmes* (1884); and *La Mer* (1886), a collection of poems. He also published the novels *Madame André* (1874); *Les Morts Bizarres* (1878), a collection of short stories written in prison; *Sophie Monnier* (1884); *Truandailles;* and many others. For the stage he wrote *La Glu* (1883); *Nana Sahib* for Sarah Bernhardt, in which Richepin took the principal male rôle when Mme. Bernhardt's leading man was taken sick; and *Monsieur Scapin*, in verse, which was produced at the Comédie Française in 1886. He also wrote the libretto for Massenet's *Le Mage.*

RICHFIELD, Utah, the seat of Sevier County, a city on the Sevier River, and on a division of the Rio Grande Western railroad, 150 miles S. of Salt Lake City. It is a trade center, with farming, gold and silver mining industries. Population, 1900, 1,969. C.L.S.

RICHFIELD SPRINGS, New York, a town and village of Otsego County, a fashionable health resort at the head of Schuyler or Canaderaga Lake, and the terminus of a branch line of the Delaware, Lackawanna and Western railroad, 12 miles N.W. of Cooperstown and 60 miles E. of Albany. Its sulphur springs are of repute for skin diseases, and it has some knitting and cap industries. Population, 1900, of village, 1,537. C.L.S.

RICHFORD, Vermont, a town and village of Franklin County, on the Missisquoi River, and on the Central Vermont and Canadian Pacific railroads, 66 miles N.W. of Montpelier. It has lumbering, farming, dairying, milling, and furniture-making industries. Pop., 1900, of village, 1,513. C.L.S.

RICH HILL, Missouri, a mining city of Bates County and an important railway junction of divisions of the Kansas City, Fort Scott & Memphis, and the Missouri Pacific railroads, 80 miles south of Kansas. It is the commercial center of a populous region, engaged in coal, iron, lead and zinc mining, and in farming, and has supplemental industrial establishments, including foundries, smelting works, lumber and flour mills, brick and tile factories, ice-plants, breweries and distilleries. Population, 1890, 4,008; 1900, 4,053. C.L.S.

RICHIBUCTO, New Brunswick, the seat of Kent County, a town and port of entry on the estuary of the Richibucto River, forming the safe and commodious Richibucto harbor opening into the Gulf of St. Lawrence at the northern end of Northumberland Strait. It is on the Northern railroad, connecting at Kent Junction with the Intercolonial system. Fisheries, lumbering, and ship-building are the chief industries. Population, 800. C.L.S.

RICHLAND CENTER, Wisconsin, the seat of Richland County, a city on Pine River and the terminus of the Lone Rock and Richland Center branch of the Chicago, Milwaukee and St. Paul railroad, 125 miles west of Milwaukee. The county insane asylum is situated here. Farming, stock-raising, and lumbering promote supplemental manufacturing industries. Population, 1890, 1,819; 1900, 2,321. C.L.S.

RICHMOND, Kentucky, the seat of Madison County, a city 110 miles southeast of Louisville, on a small branch of the Kentucky River, and a junction of division lines of the Louisville & Nashville, and the Louisville & Atlantic railroads. It is the center of a coal, iron, lumber, farming and stock-raising region exporting the products of these industries, especially cattle, mules and horses. Population, 1890, 5,073; 1900, 4,653. C.L.S.

RICHMOND, Maine, a town of Sagadahoc County, on a small stream near its confluence with the Kennebec River and on the Maine Central railroad, 44 miles N.E. of Portland. It has lumbering, cotton, shoe and ice-making industries. Population, 1890, 3,082; 1900, 2,049. C.L.S.

RICHMOND, Indiana, the seat of Wayne County, a city and important railway junction 70 miles northwest of Cincinnati and 68 miles east of Indianapolis. It is on the east fork of the Whitewater River, on three divisions of the Pennsylvania lines west of Pittsburg, and is the terminus of the Grand Rapids and Indiana main line. From a post village of 1,400 inhabitants in 1850, Richmond has developed into a well built and prosperous manufacturing city, noted for its municipal enterprise, its public buildings and institutions which include Earlham College (q.v.) founded by the Society of Friends, Old Ladies' Home, Wernie (Lutheran) Orphans' Home, and the Eastern Indiana Insane Hospital. Its considerable manufactures are chiefly of agricultural machinery and requisites. Population, 1890, 16,608; 1900, 18,226. C.L.S.

RICHMOND, Missouri, the seat of Ray County, a city 36 miles N.E. of Kansas City on the Atchison, Topeka & Santa Fé railroad. Its industries are connected with the coal mining and farming of the neighborhood, and it has mills, foundries, and canning factories. Population, 1890, 2,895; 1900, 3,478. C.L.S.

RICHMOND, Canada, a town of Richmond County, southern Quebec, 40 miles north of Sherbrooke, on the St. Francis River, opposite Melbourne, one of the county seats of Richmond and Wolfe counties. It is reached from Richmond Station to the south, on two divisions of the Grand Trunk railroad, with railroad construction and repair shops. Population, 1901, 2,056; of Richmond Station, 300. C.L.S.

RICHMOND, a village and the capital of Fort Bend County, southeastern Texas, 22 miles S.W. of Houston, on the Gulf, Colorado and Santa Fé, the Galveston, La Porte and Houston and the Southern Pacific railroads; also on the Brazos River. Steamboats can ascend the river as far as Houston. It does considerable shipping trade in cotton, corn, hides and sugar. Population, 1900, estimated at about 1,000.

RICHMOND, the capital of Virginia. It is the seat of Richmond College (Baptist), established in 1832; and in 1902 had 15 instructors, 216 pupils, and a library containing 12,200 volumes. Among the most recent buildings and monuments that have been erected are a new public library, a statue of Gen. W. C. Wickam in Monroe Park, and a bronze statue of General Robert E. Lee at Lee Circle, in the western part of the city. The city now contains 5 public libraries, with an aggregate of 65,000 volumes, and 6 daily papers, 21 weekly and 14 monthly periodicals. The following will show the amount of business transacted by some of the leading manufacturing industries of the city:

Industry.	Number of Establishments.	Aggregate Investment.	Average Number Employees.	Average Total Wages.	Value of Products.
Tobacco, chewing, smoking, and snuff....	17	$2,088,661	2,580	$738,800	$5,223,733
Tobacco, cigars and cigarettes.....	22	521,839	2,399	675,648	4,389,745
Tobacco, stemming and rehandling.....	10	443,950	687	91,642	924,325
Baking and Yeast Powders.....	6	150,000	116	53,754	598,319
Fertilizers.....	6	2,163,731	450	184,018	1,045,063
Foundry and machine shop products.....	18	5,164,103	1,636	861,334	2,594,186

Population, 1890, 81,388; 1900, 85,050. See also Richmond, Vol. XX, pp. 560–561.

RICHMOND, George, an English portrait-painter; born in London, March 28, 1809; entered the schools of the Royal Academy in 1824; began painting in water-colors, and later in oils; was elected associate of the academy in 1859, and academician in 1869. He painted almost 3,000 portraits, many of them of prominent men and women, among which are *The Earl of Elgin* (1860); *The Duke of Buccleuch* (1865), and *Sir Moses Montifiore* (1875). Among his other paintings are *Agony in the Garden* (1858), and *Sunset from Hyde Park* (1861). He was conscientious and painstaking, frequently to such an extent that his work appeared over-labored. What his paintings lack in spontaneity is made up for by their carefulness of execution. Died in London, March 19, 1896.

RICHMOND, William Blake, an English artist, son of George Richmond; born Nov. 29, 1843. He studied at the Royal Academy, and in 1859–60 traveled in Italy; in 1865 went to Rome to study. In 1870 he settled in England, and afterward followed art as a profession; was Slade professor at Oxford from 1878 to 1883, the position which Ruskin filled before and after him, and was elected associate of the Royal Academy. Among his paintings are *Procession of Bacchus* (1868); *Prometheus Bound* (1873), and *Electra at the Tomb of Agamemnon;* besides portaits of Holman Hunt, Darwin, Princess Louise, and others.

RICHTER, Gustav Carl Ludwig, a German portrait-painter; born in Berlin, Aug. 31, 1823; studied in the Berlin academy and in Paris; was made professor in the Berlin academy and member of the academies of Vienna and Munich;

obtained the grand medal in Berlin (1864); other medals in Paris, Vienna, and Philadelphia. He is best known for his portraits, among which are *Queen Louise* (1879), in the Cologne museum, and the *Hon. George Bancroft*, exhibited at the Philadelphia Exposition of 1876. His Oriental scenes, *Odalisque; The Raising of Jairus' Daughter*, in the National Gallery at Berlin, and others, show good drawing and very rich color effects. His *Victory* is in the Museum of Art, New York. Died in Berlin, April 3, 1884.

RICHTER, Hans, a German musical conductor; born in Raab, Hungary, April 4, 1843. In 1859 he entered the Conservatorium in Vienna and studied the horn under Kleinecke and theory under Lechter; played the horn in the orchestra of the Kärnthnerthor; in 1868 was made conductor of the Hof-and-National Theater, Munich; in 1871 chief conductor of the national theater at Pesth; at the Court Opera Theater in Vienna (1875); in 1876 conducted the Bayreuth Festival; in 1879, 1880 and 1881 conducted concerts in London, and attracted great attention by using no scores. Richter is one of the foremost orchestra conductors, a prominence which perhaps he owed to his practical knowledge of the technique of the instruments in an orchestra.

RICHTOFEN, Baron von, German statesman; was born at Jassy in 1847, served in the German wars of 1866 and 1870, and then entered the diplomatic service of the empire. He was director of colonial affairs in 1896–97, and in 1900 became Secretary of State for Foreign Affairs. Died January 17, 1906. W. F. J.

RICHTOFFEN, Ferdinand, Baron von, geographer and geologist; was born at Carlsruhe, in Prussian Silesia, on May 5, 1833, and in 1860 accompanied a Prussian expedition to Asia. Thereafter for twelve years he traveled in China, Japan, Siam, Burmah, Java, and California, making geographical and geological researches. Upon his return to Germany in 1872 he became president of the Berlin Geographical Society, professor of geology at Bonn in 1875, of geography at Leipsic in 1883, and at Berlin in 1886. He wrote upon California, a monumental work on *China* (1877–83), and a great *Atlas of General Geography* (1883). Died Oct. 7, 1905. W.F.J.

RICHWOOD, a village of Union County, central-western Ohio, 35 miles N.W. of Columbus, on the New York, Lake Erie and Western railroad; it is in an agricultural district, and has two large flour-mills, two steam tile-mills, several large grain-elevators, a planing-mill, two private banks and two weekly papers. Population, 1890, 1,415; 1900, 1,640.

RICINUS. See Castor Oil, Vol. V, p. 174.

RICO, Colorado, the seat of Dolores County, a town near the San Miguel Mountains, on a tributary of the Dolores River, and on a division of the Rio Grande Southern railroad, 35 miles northwest of Durango (96 miles by rail). It is a commercial center and supply base for the coal, iron, gold, zinc, copper and silver mines of the region, and has smelting establishments and mills for the reduction of ores, with some minor local industries. Population, 1890, 1,134; 1900, 811. C.L.S.

RIDDLE, Matthew Brown, theologian, was born at Pittsburg, Penn., on October 17, 1836, and was graduated from Jefferson College, Pennsylvania, in 1852, and from the New Brunswick, N. J., Theological Seminary, in 1859. He was adjunct professor of Greek at Jefferson College in 1857–58, chaplain in the Army of the Potomac in 1861, and pastor of a Dutch Reformed Church for eight years. He was professor of New Testament exegesis in the Hartford, Conn., Theological Seminary in 1871–87, and since the latter year has filled a like place in the Western Theological Seminary at Allegheny City, Penn. He was a member of the American committee on revision of the New Testament, has edited a number of commentaries, Sunday School lesson notes, and other religious works, and has been a prolific contributor to encyclopædias, reviews, and religious and literary periodicals. W.F.J.

RIDEAU, a river and canal. See Ottawa, Vol. XVIII, p. 71.

RIDGEFIELD, a town of Fairfield County, southwestern Connecticut, 28 miles N.W. of Bridgeport, on the New York, New Haven and Hartford railroad; in an agricultural district, and makes a specialty of sending milk to New York; has quarrying and grinding of feldspar and quartz; is a popular summer resort, and has a public library and several country residences of New Yorkers. Population 1900, 2,626.

RIDGETOWN, a town of W. Elgin County, Ontario, Canada, 50 miles S.W. of London, on the Michigan Central Railroad. It has flour, woolen, and lumber mills, and two weekly papers. Population 1891, 2,254; 1901, 2,405.

RIDGEVILLE, a village of Randolph County, eastern Indiana, 21 miles N.E. of Muncie, on the Grand Rapids and Indiana and the Pittsburg, Cincinnati, Chicago and St. Louis railroads. It is the seat of Ridgeville College (Congregational), a co-educational institution organized in 1892, and having in 1899, 6 instructors, 88 students, and a library containing 3,000 volumes. Population 1890, 922; 1900, 1,098.

RIDGWAY, Robert, scientist, was born at Mount Carmel, Illinois, on July 2, 1850, and received a common school education. He early turned his attention to ornithology, and in 1867–69 served under the late Clarence King as ornithologist to the U. S. Survey of the 40th parallel, in California, Nevada, Idaho, and Utah. He was a founder, and has been president of the American Ornithologists' Union, is a member of the Zoölogical Society of London and of the British Ornithologists' Union, and has been identified with several international ornithological congresses. Since 1880 he has been curator of the division of birds in the U. S. National Museum at Washington. He has written *A History of North American Birds* (with Spencer F. Baird and T. M. Brewer), *A Manual of North American Birds*,

A Nomenclature of Colors for Naturalists, *The Ornithology of Illinois*, and a great number of papers and essays upon ornithological topics.

W.F.J.

RIDPATH, JOHN CLARK, historian and educator, was born in Indiana on April 26, 1840, was self-educated in boyhood, and was graduated from Indiana Asbury, now DePauw, University in 1863. He was principal of Thorntown Academy in 1864, superintendent of schools in Lawrenceburg, Ind., in 1866, and in 1869 became a professor in Asbury (DePauw) University, at first of English literature and then of belles lettres and history. In 1879 he became vice-president of the university, and it was largely through him that the institution received its splendid endowment from Mr. DePauw (q. v.). He was a voluminous writer of historical and other works, his bibliography including *An Academic History of the United States*, *A Popular History of the United States*, *An Inductive Grammar of the English Language*, *The Life and Works of Garfield*, *A History of the World*, *Alexander Hamilton*, *The Trial of Guiteau*, *A Cyclopædia of Universal History*, and *The Epic of Life*. He was one of the editors of *The People's Cyclopædia*. He died on July 31, 1900. W.F.J.

RIEDESEL, FREDERICK ADOLPHUS, BARON VON, soldier, was born in Germany on June 3, 1738, and entered the army of the Duke of Brunswick in the Seven Years' War, being a colonel on the staff of Prince Ferdinand. When George III sought levies for his American army, Baron von Riedesel was selected to command some of the troops from Hesse, with the rank of major-general. He came to America early in the Revolution, and was with Burgoyne in his disastrous campaign. At Saratoga he was captured and was held a prisoner until 1779, when he was released by exchange. He did little more in the Revolution, but upon his return to Germany was made a lieutenant-general. He died on January 6, 1800. W.F.J.

RIEHL, WILHELM HEINRICH VON, a German novelist, publicist, and historian; born in Bieberich, May 6, 1823. He was educated at Giessen and elsewhere, and for ten years was editor of journals in Frankfort, Heidelberg, and Wiesbaden; in 1853 became professor at Munich, and in 1862 was elected to the Munich Academy of Sciences. He wrote *Natural History of the People* (1851–69); *Studies of the Civilization of Three Centuries* (1859); *German Labor* (1862); *History of Civilization* (1865); *New Book of Novels* (1867); *Types and Characters of Musicians* (1878); and others. He superintended the publication of the geographical and ethnographical magazine, *Bavaria*, and the *Historical Journal*. Died in Munich, Nov. 16, 1897.

RIEL, LOUIS, a Canadian insurgent, was born in what is now Manitoba in 1844, of French and Indian blood, and was educated at the Jesuit college in Montreal. He was probably of unbalanced mind, if not actually insane, but was possessed of many gifts of leadership, and was fanatical upon the subjects of race and religion. He conceived the scheme of leading a great insurrection against English rule and Protestantism in Canada, and when in 1869 the Northwest Territories of the Hudson Bay Company were transferred to the Dominion of Canada he raised his fellow half-breeds in revolt. He proclaimed himself "general," seized the treasury of the Hudson Bay Company, and organized a government at Fort Garry, declaring the northwest to be an independent empire. He was suppressed by Sir Garnet (afterward Lord) Wolseley in the Red River expedition (q. v., Vol. XX, p. 328. in 1870, but made his escape from the country. In 1873 he was elected to the Dominion Parliament but was not admitted to his seat. Twice afterward he tried to raise rebellions, but failed. He was finally convicted of treason-felony, and put to death on November 16, 1885. W.F.J.

RIF. See MOROCCO, Vol. XVI, p. 856.

RIFLES, MILITARY. See GUNMAKING, Vol. XI, pp. 251–252; and in these Supplements.

RIGDON, SIDNEY. See MORMONS, Vol. XVI, pp. 852–853.

RIGG, JAMES HARRISON, theologian; was born at Newcastle-on-Tyne on January 16, 1821, and entered the ministry of the Methodist Church in 1845. He was chairman of the Second District Synod of London for sixteen years, was one of the first members of the London School Board, has twice been president of the Wesleyan Conference, was a member of the Royal Commission on Education in 1886–88, and has been treasurer of the Wesleyan Missionary Society since 1881, vice-president of the Bible Society since 1887, and principal of the Westminster Training College for Day School Teachers since 1868. He is the author of more than a score of religious and theological works, and contributed the article on METHODISM to this ENCYCLOPÆDIA. He has long ranked among the foremost scholars and theologians of the Methodist Church in Great Britain. W.F.J.

RIGGS, ELIAS, missionary; was born at New Providence, New Jersey, on November 19, 1810, and was a precocious student, teaching himself Hebrew at the age of eleven. Before he was fifteen he entered Amherst College, where, in addition to the regular course, he studied Chaldee and Syriac, the latter from a grammar in Latin. He was graduated in 1829, spent the next three years at Andover Theological Seminary, and was then ordained into the ministry, and at once sailed for Greece as a missionary. For six years he labored diligently in Greece, chiefly at Argos, and then for five years at Smyrna and in other Greek communities of Asiatic Turkey. Thence he proceeded to Armenia, and finally settled in Constantinople. Meantime he translated the Bible into Bulgarian and Armenian, and assisted in translating it into Turkish. In 1856–58 he revisited America and taught Hebrew in the Union Theological Seminary, New York. He was the author of a number of religious works and of Chaldee, Bulgarian, Armenian and Turkish grammars. He died on January 17, 1901. W.F.J.

RIGHT ASCENSION. See ASTRONOMY, Vol. II, p. 669.

RIGI OR RIGHI, Switzerland, a mountain rising 5,902 feet high, between Lakes Lucerne, Zug, and Lowerz, its summit reached by a funicular railroad from Lake Lucerne and one from Lake Zug. On the pine covered slopes are several villages and summer hotels. C.L.S.

RIG-VEDA. See SANSKRIT, Vol. XXI, p. 283.

RIIS, JACOB A., a Danish-American journalist and writer on sociology; born May 3, 1849, at Ribe, Denmark. He acquired a knowlege of the English language by reading English novels, and removed to America in 1870. He was for a time a reporter on the New York *Tribune*, and later police-reporter in New York for the Associated Press, and as such became acquainted with tenement-life in the poorest and most squalid parts of the city. The results of these observations he published in 1890, under the title *How the Other Half Lives*, which attracted immediate attention. In 1892 followed *Children of the Poor*, and in the following year *Nisby's Christmas*, a collection of three stories, the title of the first of which gives the name to the book. Although fiction, they were written as sociological studies and with the philanthropical purpose of attracting attention to the miserable conditions under which life is supported in the crowded neighborhoods of the East Side.

RILEY, CHARLES VALENTINE, entomologist, was born in London, England, on September 18, 1843, studied at Bonn, Germany, and came to America in his seventeenth year. He became a farmer in Illinois, and there began the study of insects. At the age of twenty he was editor of the *Prairie Farmer* in Chicago, and soon afterward began writing for various scientific periodicals. In 1868–77 he was state entomologist of Missouri, issued nine annual reports of great value, and founded and edited the *American Entomologist*. He afterward made a study of the locust plagues of the west, and in order to deal with them and with other insects secured the creation of a National Entomological Commission, of which he was a member. This body worked from 1877 to 1882, and made valuable reports and recommendations concerning the locusts, the cotton worm, the boll weevil, the army worm, the canker worm, and other injurious insects. Mr. Riley was U. S. entomologist from 1878 to 1894, and organized the Bureau of Entomology, which is now an important part of the department of agriculture. Between 1866 and 1884 he visited France several times for the study of phylloxera, and introduced American grape vines into France, as proof against that pest, for which service the French vine growers gave him a gold medal and a bronze statue, and the French government gave him the cross of the Legion of Honor. He introduced the practice of spraying fruit and other trees for the destruction of insect pests, and invented an apparatus for the purpose, and also several insect-killing mixtures. He died on September 14, 1895. W.F.J.

RILEY, JAMES WHITCOMB, author; was born at Greenfield, Ind., in 1853, and acquired his education in the public schools. About 1873 he began to contribute random verses to local newspapers, chiefly in the "Hoosier" dialect of Indiana country folk. The natural simplicity and homeliness of his writings pleased the public, and he soon became widely known in the magazines as the "Hoosier poet" and as one of the most popular "dialect" writers in America. He published his first volume under the pen-name of "Benj. F. Johnson, of Boone," but has since then used his own name. His books include *The Old Swimmin' Hole and 'Leven More Poems* (1883); *The Boss Girl and Other Sketches* (1886); *Afterwhiles* (1888); *Pipes o' Pan at Zekesbury* (1889); *Old-Fashioned Roses* (published in England); *Green Fields and Running Brooks* (1893); *Rhymes of Childhood; Flying Islands of the Night; Poems Here at Home; Armazindy; A Child World; An Old Sweetheart of Mine; Neighborly Poems; Home Folks; The Rubaiyat of Doc Sifers; While the Heart Beats Young*, etc. His poems include humorous, serious, and pathetic, and are by no means all in dialect, though those in the Hoosier dialect are by far the most popular and best known. Mr. Riley has often appeared upon the stage as a reader of his own poems, and for a time was thus associated with "Bill" Nye, the humorist. In his early years he was for a time an actor in a traveling company, and had some experience in playwriting and adapting. He has written little in prose, save for newspapers. W.F.J.

J. WHITCOMB RILEY.

RINDFLEISCH, GEORG EDOUARD. See PATHOLOGY, Vol. XVIII, pp. 366–367.

RINEHART, WILLIAM HENRY, sculptor, was born in Maryland on September 13, 1825, and in his boyhood worked in a quarry on his father's land, where he first showed indications of artistic talent. He next secured employment in a stonecutter's works in Baltimore, and studied art at the Maryland Institute of Design. In 1855–57 he worked and studied in Italy, and in 1858–66 had a studio in that country, in which he produced many fine works of art. He returned to Baltimore in 1866 and produced a noble bronze statue of Roger B. Taney, formerly chief justice of the U. S. Supreme Court, which now stands in Annapolis. After the unveiling of that work, in 1872, he returned to his studio in Rome and there spent the remainder of his life. He made the bronze doors of the Capitol at Washington, and a number of statues of distinguished men. Most of his well known works, apart from portrait statues, are classical or ideal subjects. His *Clytie*,

considered by many to be his masterpiece, is in the Rinehart gallery of the Peabody Institute, to which institution he left his estate and the contents of his studio. He died at Rome on October 28, 1874. W.F.J.

RING-ARMATURE. See ELECTRICITY, §80, in these Supplements.

RINGBONE, a bony tumor growing on the upper or lower pastern bone of the horse's leg. It is generally caused by overwork, but is sometimes found on colts. The growth may form a "ring" about the leg, or appear only on the side of the limb. True ringbone, which affects the ends of the bones, gives rise to obstinate and frequently incurable lameness; while false ringbone, an exostosis near the middle of the long pastern bone, generally gives no inconvenience. R.W.C.

RINGWORM. See SKIN DISEASES, Vol. XXII, p. 132.

RING, MAX, novelist; was born at Sauditz, Silesia, on August 4, 1817, and has been a prolific writer of fiction, among his best known works being *The Children of God* (1851); *The Great Elector and the Alderman* (1851); *The Lost Race* (1867); *The Friends of the Soul* (1871); *Chains of Gold* (1881); *The Victory of Love* (1886), and *Seekers and Strivers* (1888). Many of his works have been translated into English and other languages. He died March 28, 1901. W.F.J.

RINK, HINRICH JOHANNES, explorer and ethnologist; was born in Copenhagen, Denmark, in 1819, and spent many years in travels and research in various parts of the world, but chiefly in Greenland, where he was settled as a government administrator. He wrote a number of standard works on Greenland and the Esquimaux, and died at Christiania, Norway, in 1893. W.F.J.

RIOBAMBA NUEVO, Ecuador, the capital of the province of Chimborazo, a city 84 miles northeast of Guayaquil, and nine miles from the ruins of Old Riobamba, at the foot of Chimborazo, which was destroyed by an earthquake in 1797. It is an episcopal see, and a trading center for the surrounding region, on the high road traversing the republic from north to south. Population, 18,000. C.L.S.

RIO CUARTO, a town in the central part of the Argentine Republic, on the river Rio Cuarto 119 miles S. by W. of Corboda. See RIO DE JANEIRO, Vol. XX, p. 577. Pop. 10,900.

RIO DE JANEIRO, the capital of Brazil. Population, 1906, 811,265. See RIO DE JANEIRO, Vol. XX, pp. 577–578.

RIO DE LA PLATA. See PLATE, Vol. XIX, pp. 198–200.

RIO DE ORO, a bay on the Atlantic coast of Africa, lying between the mainland and the Ed-Dajla Peninsula. It belongs to the Spaniards, and has a population, with Adrar, of about 100,000.

RIO GRANDE, a post hamlet of Gallia County, southern Ohio, known only as the site of Rio Grande College, a co-educational institution of Free Baptist denomination, and having in 1904 12 instructors, 166 students, and a library containing 3,250 volumes.

RIO GRANDE CITY, a village of Starr County, southern Texas, on the Rio Grande (navigable), 100 miles S.S.W. of San Diego. It has an extensive trade in hides and wool. The inhabitants speak Italian almost exclusively. Population, 1890, 1,968.

RION, a river. See CAUCASUS, Vol. V, p. 221.

RIO NEGRO. See PATAGONIA, Vol. XVIII, p. 358.

RIO NEGRO, the most important tributary of the Amazon on the north side. It rises in Colombia, near lat. 2° N., long. 72° W. Its flow is east-southeast, enters the state of Pará, in Brazil, and joins the Amazon in lat. 3° 10′ S., long. 59° W. The principal affluents are the Cababuri, Uanpes, Padarin and Rio Branco.

RIOUW-LINGGA OR RIOU-LINGA, East Indies, an archipelago of the South China Sea, separated from Singapore at the extremity of the Malay Peninsula, by the great commercial route of Singapore Strait. The archipelago, covering an area of 1,800 square miles, consists of two groups of islands, Riou, the northern, comprising over 30 islands, of which Bintang, containing the capital Riou, is the largest, while Linga, the southern group, includes the large islands of Linga and Singkap, and several smaller ones. The archipelago is rocky and reaches a maximum altitude of 1,620 feet. The islands are densely forested, and yield gambier and hardwoods which, with pepper, rice, sago, and other cultivated products, are exported. The former valuable tin mines have been depleted. Estimated population 80,000, chiefly Malays. C.L.S.

RIPLEY, Ohio, a village and port on the Ohio River in Brown County, opposite South Ripley, Kentucky, on the Chesapeake & Ohio railroad. It is a tobacco-growing and manufacturing center. Population, 1900, 2,248. C.L.S.

RIPON, a city of Fond du Lac County, eastern Wisconsin, 25 miles E. of Montello, and 20 miles W. of Fond du Lac, on the Chicago, Milwaukee and St. Paul railroad. It has several flour and planing mills, and marble-works, foundries and machine-shops, knitting-works and windmill factory. It is the seat of Ripon College, a co-educational, non-sectarian institution organized in 1863, which had in 1904, 16 instructors, 163 students and a library containing 12,000 volumes. Population, 1890, 3,358; 1900, 3,818.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, FIRST MARQUIS OF, statesman; was born in London on October 24, 1827, the son of the first Earl of Ripon. He succeeded his father as Earl of Ripon and his uncle as Earl de Grey, in 1859, having for seven years preceding been a member of the House of Commons. He was under-secretary of state for war in 1859–61; under-secretary for India in 1861–63; secretary of state for war in 1863–66; secretary of state for India in 1866–68, and lord president of the Council in 1868–73. He was chairman of the Joint Com-

mittee for drawing up the Treaty of Washington in 1871. In 1871–74 he was grand master of the Freemasons, but in the latter year left that order and joined the Church of Rome. Since then he has been viceroy of India in 1880–84; first lord of the Admiralty in 1886; secretary of state for the Colonies in 1892-95, and mayor of Ripon in 1895-96. He was made Marquis of Ripon in 1871. W.F.J. He became Lord Privy Seal in Campbell-Bannerman Cabinet, December, 1905. *Revised* A.R.R.

RIPPLE-MARKS. See GEOLOGY, Vol. X, 260.

RISING SUN, a town and the capital of Ohio County, southeastern Indiana, 11 miles S. of Lawrenceburg, on the Ohio River, and on the Cleveland, Cincinnati and St. Louis railroad. It has a graded school, a tannery, two steam flouring-mills and manufactories of furniture and plows. Population 1890, 1,689; 1900, 1,548.

RISTIC OR RISTICH, JOHN, a Servian statesman; born in 1831, in Kragujevatz, and educated in Germany and in Paris. He held various minor appointments from the government of Servia until 1858, when he was made secretary of a deputation sent to Constantinople; later was made Servian minister there; in 1869 became Minister of Foreign Affairs, and after the assassination of Prince Michael in 1868, member of a council of regency to govern the country during the minority of Prince Milan. In 1872 the council became a ministry, Ristich holding the portfolio of Foreign Affairs. He held the same office during the disastrous war of 1877 with Turkey; was sent to the Congress of Berlin, and was very influential in securing the independence of Servia. Upon the abdication of King Milan in 1889, he again became a member of a council of regency, but when King Alexander reached his majority was dismissed from office and banished. Ristich was the leader of the party in Servia which favors Russia. D. 1899.

RISTORI, ADELAIDE. See GRILLO, MARQUISE DEL, in these Supplements.

RITCHIE, ANNA CORA MOWATT, author and actress; was born at Bordeaux, France, in 1819, the daughter of S. G. Ogden of New York. She was educated in New York, and married James Mowatt at the age of sixteen. She wrote an epic poem, *Pelayo*, in 1836, and a play, *Gulzara*, in 1838. In 1841 she began giving public readings, and under the pen-name of "Helen Berkley" wrote several novels—*The Fortune-Hunter* (1842); *Evelyn* (1845), and others. In 1845 she began acting at the Park Theater, New York, and later was associated with E. L. Davenport in *The Hunchback*, and her own plays of *Fashion* and *Armand*. After a successful career she retired from the stage in 1854, having married W. F. Ritchie, editor of the Richmond, Virginia, *Enquirer*. She then resumed literary work, and produced *The Autobiography of an Actress* (1854); *Mimic Life, or Before and Behind the Curtain* (1855); *Twin Roses* (1857); *Fairy Fingers* (1865); *The Mute Singer* (1866); *The Clergyman's Wife* (1867), and *Italian Life and Legends* (1870). Her health was broken by her attention to her invalid and dying father, and in 1861 she went to Italy, where most of her life thereafter was spent. Her husband died in 1868, and she died in London on July 28, 1870. W.F.J.

RITCHIE, ANNE ISABELLA (THACKERAY), an English novelist, daughter of the novelist William Makepeace Thackeray; born in Albion Street, London, in 1838. Several years of her childhood were spent in Paris, but she has passed the greater part of her life in Kensington. Her first published work was *The Story of Elizabeth* (1863), which was at once successful. This was followed in 1865 by *The Village on the Cliff; To Esther, and Other Sketches; Old Kensington*, the work by which she is best known; *Blue Beard's Keys; Toilers and Spinners; Miss Angel* (1875); *Anne Evans* (1880); *Madame de Sévigné* (1881); *A Book of Sybils* (1883); *Mrs. Dymond* (1885); *Lord Tennyson and His Friends* (1893); *Lord Amherst and the British Advance Eastward to Burmah* (1894); and *Chapters from Some Unwritten Memoirs* (1895).

RITCHIE, ELIZA, educator, was born in Nova Scotia and was graduated from Dalhousie University, Halifax, with honors in 1887. She was a student at Cornell University for two years, and in 1890 was appointed to the professorship of psychology and history of philosophy in Wellesley College. W.F.J.

RITCHIE, THOMAS, journalist and politician; was born in Virginia in 1778. In 1804 he became editor of the *Enquirer*, at Richmond, Virginia, and thereafter devoted himself to journalism and political leadership with noteworthy success. For more than forty years he edited the *Enquirer* and made it one of the most influential Democratic papers in the country and one of the strongest advocates and exponents of State Rights. In 1845 he relinquished the *Enquirer* to his two sons and went to Washington at the request of President Polk to edit the *Union*. He returned to Richmond in 1849, and died on July 12, 1854. His son William was the husband of Anna Cora Mowatt Ritchie (q. v., supra). W.F.J.

RITCHIE, WILLIAM JOHNSTONE, SIR, jurist, was born in Nova Scotia on October 28, 1813, and was admitted to the bar in 1838. He had a distinguished career as puisne judge, chief justice of New Brunswick and of the Dominion, and deputy governor of the Dominion. He died on September 25, 1892. W.F.J.

RITES, CONGREGATION OF. See ROMAN CATHOLIC CHURCH, Vol. XX, p. 645.

RITSCHL, ALBRECHT, a German theologian; born in Berlin, March 25, 1822. He was educated at Bonn and Halle; became instructor in the University of Bonn in 1346, afterward was professor of theology there until 1864, when he was appointed to the same chair at Göttingen. He wrote many works on the Lutheran doctrines, as *The Christian Doctrine of Justification and Reconciliation* (1870–74); *History of Pietism* (1880); *Theology and Methaphysics* (1881); *Instruction in Christian Religion* (1875); and *Origin of the Ancient Catholic Church* (1850). Ritschl was the founder of a

school of theologians who reject the doctrine of the trinity, incarnation, original sin, and other orthodox beliefs, and hold that the religious sense is the essential and ultimate fact in religion. He died March 20, 1889.

RITTENHOUSE, BENJAMIN, inventor; was born in Pennsylvania about 1741. He was superintendent of the Pennsylvania arsenal in the Revolution, a member of the assembly of that state, and a county judge. He is most remembered as the inventor of the standard surveyor's chain used by the United States Land Office. He lived in Philadelphia most of his life, and died there in 1825. W.F.J.

RITTER, HEINRICH, philosopher; was born in Germany in 1791 and devoted himself to the study of philosophy and its history. His works upon those subjects, published at intervals from 1817 to 1863, are standard authorities. He died in 1869. W.F.J.

RITTER, FREDERIC LOUIS, musician, was born at Strasburg, Alsace, on June 22, 1834, and came to America at the age of twenty-seven years. He settled in Cincinnati as a teacher and director of music. In 1862 he removed to New York, and for some years was conductor of the Arion Society and of the Sacred Harmony Society. In 1870 he became the head of the department of music at Vassar College, and filled that place for the rest of his life. The University of the State of New York made him a Doctor of Music in 1878. He was the author of *Lectures on Music*, *Practical Harmony*, *Student's History of Music*, *Manual of Musical History*, *Musical Diction*, *Music in America*, *Music in England*, etc., and was the compiler of *The Woman's College Hymnal*, and editor of *The Realm of Tones*. He was the composer of a great number of pieces of music, for the orchestra, organ, pianoforte, violin, and other instruments, and for the human voice. He died during a visit to Europe, at Antwerp, on July 6, 1891. W.F.J.

RITTER, WILLIAM EMERSON, scientist and educator, was born at Hampden, Wisconsin, in 1856, and was graduated from the University of California in 1888. He also studied at the Zoölogical Station at Naples, Italy, and at the University of Berlin. He is associate professor of zoölogy in the University of California, and president of the California Academy of Sciences. He has written many articles on zoölogy, biology, comparative anatomy, and other topics. W.F.J.

RITUALISTS, the name given to a school of theologians in the English Church who advocate the adoption, by the modern church, of a ritual more nearly like that of the Roman Catholic Church than the service now used. The school is a modern development of the High Church party which has been in existence in England since the Reformation, and which has always tried to preserve the catholicity of the church from innovations by the various more radically Protestant sects to which the Reformation gave birth. The movement proceeded immediately from the Tractarianism of the earlier part of the century, and owes its origin to the impetus which that movement gave to the study of early ecclesiastical history. It first manifested itself in the introduction of choral services similar to those of the Roman Catholic Church, later in a more strict adherence to the letter of the Church Prayer-Book, which prescribes a liturgy more similar to the Roman Catholic liturgy than that previously in vogue in the Anglican Church, and lastly in a revival of the ancient pre-Reformation rites of the English Church. The movement met with considerable opposition from the Low Church party, has been denounced as treasonable and Romanizing in its effects, and several of its leaders have been prosecuted, although, as a rule, without success. One of the most notable cases was the trial of the Bishop of Lincoln, who, however, obtained a practical victory over his opponents. Ritualism has spread from the mother church in England to its American offspring, the Protestant Episcopal Church of America, and has been the cause of considerable discussion, notably in the Baltimore General Convention of 1871.

RITUAL OF THE DEAD. Champollion and De Rougé gave this name to collections of prayers found in sarcophagi and in the tombs of ancient Egypt. They were written on parchment in hieroglyphics. In the Louvre and in other museums are preserved considerable portions. At an early date the belief in magic prompted the idea of composing little formularies for the use of the dead, and these were formed into a sort of manual, as a viaticum to preserve the departed against the evil geniuses of the tomb. The compilation became very large and received the title *Permhron*. There are sixty-five chapters. One copy, more or less complete, written on papyrus was placed near the mummy. Long extracts were copied upon the walls of the passage leading to the funeral chapel, as also on the sarcophagi. Certain priests culled sentences from all this medley and pretended to elucidate them according to tenets of their own schools. The priests of Thebes compiled thus the *Book of the Gates*, a manual, or guide, to infernal geography. There was a *Ritual of Embalming*, and the *Book of the Opening of the Mouth*, as well as other treatises. W.R.B.

RIVAS, a town of Nicaragua, and the capital of the department of the same name. It was the ancient town of Nicarao, and most of its inhabitants are Indians. Population, 1900, 15,000.

RIVERS. See GEOLOGY, Vol. X, pp. 241–247.

RIVERS, PEARL, pseudonym of NICHOLSON, MRS. ELIZA JANE; q.v., in these Supplements.

RIVER FALLS, Wisconsin, a city of Pierce County on the Kinnickinnick tributary of the Mississippi River, 30 miles east of St. Paul, Minnesota, on the Hudson and Ellsworth division of the Chicago, St. Paul, Minneapolis & Omaha railroad. A State Normal School is situated here. Milling industries promoted by abundant water power, and cereal, tuber, fruit, and wool products, with live cattle, supply an export trade. Population, 1890, 1,783; 1900, 2,008. C.L.S.

RIVERHEAD, Long Island, New York, the seat of Suffolk County, a town at the head of navigation on Peconic River, a short distance from its outlet in Great Peconic Bay, 74 miles by rail east of New York city. It has lumber, flour, pickling, canning and other industries. Population, 1890, 4,010; 1900, 4,503. C.L.S.

RIVERSIDE, California, the seat of Riverside County, a city on the Santa Ana River, and on divisions of the Southern California and the Southern Pacific Company railroads, 50 miles east of Los Angeles. It is a well built city with beautiful tree lined streets and avenues, Magnolia avenue being world famous. It is a citrous fruit-growing center, exporting enormous quantities of oranges, lemons, grapes, etc. Population, 1890, 4,683; 1900, 7,973. C.L.S.

RIVES, Amélie, the maiden name of a Virginian novelist, granddaughter of William Cabell Rives; was born in Richmond, Virginia, Aug. 23, 1863, and passed her girlhood near Charlottesville, Albemarle County, Virginia. At an early age she exhibited a passion for art and literature. Her first production was a series of stories entitled *A Brother to Dragons* (1888), which showed imagination and a sort of untutored strength. This was followed, in the same year, by *The Quick or The Dead?* which brought the author into prominence as a writer of sensational fiction, "with a tendency to ridiculous extravagance in the representation of passion." Her later writings include *Herod and Mariamne*, a tragedy in blank verse (1889); *The Witness of the Sun* (1889); *Virginia of Virginia* (1890); *According to St. John* (1891); *Barbara Dering* (1892); *Tanis* (1893); and *Athelwold* (1893). In 1888 she married John Armstrong Chanler, a descendant of the first J. J. Astor, but they were divorced for incompatibility, and in 1896 she married Pierre Troubetskoi, the son of a Russian prince.

AMÉLIE RIVES.

RIVES, George Lockhart, lawyer, was born in New York on May 1, 1849, and was graduated from Columbia College in 1868, and from Trinity College, Cambridge, England, in 1873. He was admitted to the bar in 1874, was corporation counsel of New York in 1902–03, and is a trustee of Columbia College, of the New York Public Library, and of other institutions. W.F.J.

RIVES, William Cabell, statesman; was born in Virginia on May 4, 1793, and was a political disciple of Jefferson. He served in the Virginia legislature, and in Congress in 1823–29. He was minister to France in 1829–32, and in 1849–53, and during most of the interval between the two terms was a United States Senator from Virginia. In 1861 he was a member of the Provisional Confederate Congress. He wrote a *Life of John Hampden* (1845); *Ethics of Christianity* (1855), and *Life and Times of James Madison* (1859–69). He died on April 26, 1868. W.F.J.

RIVIERA. See Italy, Vol. XIII, p. 446.

RIVIÈRE, Briton, an English painter; born Aug. 14, 1840, in London; educated at Oxford, and studied art at the same time, under his father, who was instructor in drawing there. In 1858 he exhibited, in the Academy gallery, *Sheep on the Cotswolds* and *On the Road to Gloucester Fair;* and after 1864 was a regular exhibitor in the Academy. He was elected associate in 1878; academician in 1881; and obtained medals at the Philadelphia and Paris expositions. His pictures are characterized by delicacy and refinement in drawing and color. Among them are *Genius Loci* (1876); *The Poacher's Widow*, in the Public Library, Birmingham; *Let Sleeping Dogs Lie* (1881); *Of a Fool and His Folly There is No End* (1889); *Daniel's Answer to the King* (1890); and *Rus in Urbe* (1890). His best picture, *Syria—The Night Watch*, is in the Walters Gallery, Baltimore.

RIVIERE DU LOUP, (Fraserville), Temiscouata County, Quebec, Canada, on the Intercolonial and the Temiscouata railroads. It is on the river St. Lawrence, 125 miles below Quebec, and is the seat of Fraserville Institute, a convent and an academy. The inhabitants are nearly all French. Population 1891, 4,175; 1901, 4,569.

RIVIÈRE DU LOUP (EN HAUT) or LOUISEVILLE, Canada, the seat of Maskinongé County, Quebec, on the north bank of the St. Lawrence, 50 miles by rail northeast of Montreal. Population, 1901, 1,655. C.L.S.

ROAD, The Law of the, a term of two meanings, referring, in the first place, to the laws governing the meeting or passing of persons or vehicles upon the highways, and secondly, to the rules governing the sailing, steering or navigation of vessels upon navigable waters when meeting or passing each other. The American law of the road as to vehicles is exactly the opposite of that described in the English epigram:

> "The law of the road is a paradox quite,
> In riding or driving along:
> If you go to the left, you are sure to go right,
> If you go to the right, you go wrong."

The American driver keeps to the right, the English to the left. As a general principle of law, when vehicles meet upon roads that cross, the one first reaching the intersection has the right of way, subject, invariably, to the proper and legitimate user of the highway by foot-passengers, for whose safety the driver of the vehicle is legally bound to observe caution.

In England, when one vehicle overtakes another, the latter gives way to the left, and the other passes on his right-hand side. The rules of the highroad, however, are all subject to the general principle of law that all persons traveling on the highway, whether riding, driving or walking, must use reasonable care and diligence to avoid collision.

In American cities, patrol-wagons of the police force, ambulances and fire-engines have the right of way, and are provided with warning-gongs. In England, fire-engines alone are thus favored.

The conveyance of the United States mails is protected and insured by Federal statutes, rendering it highly penal to obstruct their transport. These statutes confer a right of way upon mail carts and carriers: Lawful processions held under permit, the movement of state or Federal troops, and funeral *cortéges* also, have priority over ordinary traffic. Physicians are frequently given badges for the same purpose.

As to pedestrians, the rule of the road on both sides of the Atlantic is the same, to keep to the right. Under the provisions of the Highways and Locomotives Amendment Act, 1882, the quarter sessions in English counties, and the municipal authorities or local boards in towns and villages, have powers conferred upon them to pass by-laws regulating the use of bicycles and tricycles within their respective districts. Nearly every local authority passed similar by-laws which substantially provided for the carrying and sounding of a bell when overtaking any person or vehicle, the carrying of a lighted lamp after nightfall, moderation in speed, prohibition of racing, and reasonable rules for dismounting when restive horses are encountered. These by-laws are now enforced by the county councils. Similar municipal regulations are to be found in the principal cities and villages of America, and in each country the prohibition of riding upon the sidewalk is usual, and a violation is rendered penal.

The law or rule of the road at sea comprises the rules governing the navigation of vessels at sea, and the precautions required to avoid collisions. These matters, in the days of fast Atlantic vessels, and vast fleets of merchant vessels, have become questions of international regard and regulation. The tendency, the world over, is toward the adoption of a uniform system by all maritime countries. An International Maritime Conference met at Washington Oct. 16, 1889, for the purpose of discussing, revising and amending the rules, regulations and proceedings in relation to vessels at sea, and navigation generally. It remained in session until December 31st of the same year, and the report of its proceedings filled three large volumes. It recommended the adoption of a rule of the road at sea, corresponding closely to that which already existed. This rule was to go into effect March 1, 1895, and was generally adopted by Austria, France, Germany, the Netherlands, Portugal, Spain, Sweden and the United States. British objections, however, postponed the day of the universal international operation of the rule.

There are certain rules of navigation which have been adopted by the courts of all nations, and have the effect of positive law. They may be generally stated as follows: 1. When two sailing or steam vessels are approaching each other bow on, or nearly so, both helms must be put to port or left, so that each may pass on the port or left-hand side of the other; 2. When two sailing-vessels are crossing, and have the wind on different sides, the one with the wind on the starboard or right side shall have the right of way, unless she is sailing with the wind free, and the other is closehauled, in which case the vessel with the wind free must give way to the other; 3. As a steamboat is deemed as always sailing with a free and fair wind, and capable of better control than a sailing-vessel, the former must always keep out of the way of the latter; 4. Every vessel overhauling another must keep out of the way of the latter; 5. A vessel clearing out of a harbor must make way for another vessel that enters; 6. When two steam-vessels approach each other on such a course that a collision is possible, each shall slacken speed, and if necessary, stop and reverse, and in a fog, steam-vessels must go at a moderate speed; 7. The master of a vessel entering a port or river where other vessels are lying at anchor is bound to make use of all proper checks to stop the headway of his vessel, in order to prevent accidents.

Although the foregoing are "rules," adopted for the general guidance of masters of vessels, they are subordinate to the rule prescribed by common sense, which is, that every vessel shall keep clear of every other vessel when she has the power to do so, notwithstanding that such other vessel may have taken a course in violation of the rules of navigation. In no case would a master be justified in keeping his course after it became apparent that to do so would result in a collision, if by changing such course without injury a collision could be avoided.

All vessels are required to display lights at night, whether sailing-vessels or steamboats, and whether under way or at anchor. These lights, and their arrangements, are such that the observer can tell whether they are carried by a sailing or steam vessel; whether the vessel is under way or at anchor; and if under way, the course the vessel is steering. The rules regarding lights are as follows: 1. Seagoing steamers while under way must display at the foremast-head a bright white light, on the starboard side a green light, and on the port side a red one. The side lights must be so arranged with inboard screens that they cannot be seen across the vessel's bow. 2. Steamers having other vessels in tow must display two white lights at the masthead, instead of one. 3. Sailing-vessels must display green and red side lights described above, but none at the masthead. 4. All vessels at anchor, whether propelled by wind or steam, must display, not more than twenty feet above the hull, a white light in a globular lantern eight inches in diameter.

In fogs, whether by day or night, steam-vessels under way must sound a steam-whistle at intervals of not more than one minute; sailing-vessels under way must sound a fog-horn at intervals of not more than five minutes; and when at anchor, both steamers and sailing-vessels must ring a fog-bell at intervals of not not more than five minutes.

In maritime law, although the term *collision* is applied to all cases of vessels running foul, technically it only applies to the act of two vessels striking together; when one vessel strikes against another, it is called *allision*. In either case, the

injured parties have, under the general maritime law of all civilized nations, a claim against the offending vessel for any damage resulting. There may be a collision without actual contact, as where one vessel, by careless navigation, compels another to run ashore to escape greater peril. Collisions are usually classified as follows: 1. Those which occur without blame attaching to either vessel; as where the injury is occasioned by a storm. In such cases the misfortune must be borne by the party on whom it happens to light, the other not being responsible to him in any degree. 2. Those which arise where both vessels are at fault—where there has been a want of due diligence or of skill on both sides. In such cases, the law apportions the resulting damage between them, both having contributed to the injury. 3. Those in which the injured vessel is free from blame, and the collision is the result of negligence or violation of the rules of navigation by the other. In this class of cases, the offending vessel must respond in damages for all losses sustained. See also NAVIGATION, Vol. XVII, p. 285.

ROADS. See ROADS AND STREETS, Vol. XX, pp. 597–604; and HIGHWAYS, Vol. XI, pp. 724–725.

ROADS, MOVEMENT FOR GOOD, IN THE UNITED STATES. The entire subject of road-making has been well and fully dealt with under ROADS AND STREETS, Vol. XX, pp. 597–604, though, in the main, the article deals with the roads of England and Europe. America's first roads were mere Indian trails, which skirted the watercourses, and crossed mountain ranges by convenient gaps. When the Pilgrims came to New England the towns took control of roads, and many an old New England record mentions roads, eight and ten rods wide, authorized by law, and of which but a portion was devoted to traffic.

The eighteenth century saw the introduction of turnpikes, many constructed and maintained by private companies, which were allowed to collect toll. These turnpike roads were probably the first instances of the use of gravel or broken stone for surface material. Congress, in 1796, authorized the construction of a national road from Baltimore westward. It ran for 650 miles, through Pennsylvania, Ohio and Illinois; its width was eighty feet, thirty of which consisted of broken stone. With the advent of the steam-railroad it fell into a bad state of repair, but is still known as a good, well-graded road.

The introduction of the bicycle in the United States soon crystallized public opinion in regard to the necessity of good roads. In 1885 an extensive agitation began, mainly produced by the efforts of Colonel Pope and the bicycle-riders of the country, and which produced very excellent results. The movement spurred county commissioners, township municipalities and selectmen, and borough counties to improve existing and construct fresh roads. The efforts of the League of American Wheelmen (q.v., in these Supplements) have been extensively directed toward the improvement of the American roads, and many public-spirited men have endeavored to convince the farmer-taxpayer of the inevitable saving which will ensue from the improvement of all local roads. In 1892, and as a result of such agitation, the state of New York spent over two and a half million dollars in road-improvements in fifty counties, and repeated instances of amended highway legislation have occurred in the various state legislatures.

Literature has aided the effort, and an excellent work from the pen of N. S. Shaler, dean of the Lawrence Scientific School of Harvard University, appeared in 1896, under the title *American Highways: A Popular Account of their Conditions and of the Means by Which They may be Bettered.* It dealt with the subject of improved highroads from historical and existing aspects, contained much practical matter as to road-construction and cost, and included a useful bibliographical list of important works on the subject of highway-construction.

ROANOKE, a city of Roanoke County, southwestern Virginia, on the Roanoke River, 258 miles by rail W. of Norfolk, at the junction of the Shenandoah Valley and the Norfolk and Western railroad. It has extensive machinery, iron and steel works, locomotive and car shops, and a tobacco factory. It is in an iron-mining, tobacco-growing and live-stock section, and has a very good general trade. There are mineral springs of great medical value in the vicinity. Population 1890, 16,159; 1900, 21,495.

ROANOKE COLLEGE, a non-sectarian institution of learning, founded in 1853, and situated in Salem, Virginia. The college offers a four years' course, which is partially elective. The grounds of the institution embrace twenty acres, and there are four buildings, one of which is a library containing 23,000 volumes. In 1906–07, there were 260 students in attendance; the number of instructors, 16. The total productive funds of the college amount to $70,000, and its annual income, $16,149.

ROANOKE RIVER, Virginia and North Carolina, flows into Albemarle Sound below Plymouth, in Washington County, N. C., after a southeasterly course of 260 miles from the junction at Clarksville, Va., of its Alleghany headstreams, the Dan and Staunton. It is navigable for vessels 75 miles to Halifax at the great falls, around which a canal opens navigation for smaller boats. C.L.S.

ROATAN, an island. See HONDURAS, Vol. XII, p. 133.

ROBBERY. See THEFT, Vol. XXIII, p. 250.

ROBERT II AND III, Scottish kings. See SCOTLAND, Vol. XXI, pp. 512, 513.

ROBERT COLLEGE, an American institution of learning in Constantinople, Turkey. It was founded and has been maintained largely by the gifts of Christopher R. Robert of New York, who, upon his death in 1878, left a bequest of one fifth of his estate to the institution. His total benefactions to it amount to nearly half a million dollars. The college was chartered under the laws of New York state as one of the colleges of the University

of New York, and was opened in a rented building in 1863, Rev. Cyrus Hamlin becoming its first president. Since its establishment, 1,715 students have attended the college, of which 274 have graduated.

ROBERT-FLEURY, the name of two French painters, father and son. JOSEPH NICOLAS, the father, was born in Cologne, Aug. 8, 1797. He studied art in Paris. Among his best known works are *Massacre of St. Bartholomew; Conference at Poissy in 1561;* and *Jane Shore*, —all of which are in the Luxembourg; *The Entrance of Clovis into Tours*, at Versailles; and *The Institutions of the Juges Consuls; The Promulgation of the Ordinance of Commerce*, and others, in the new palace of the Tribunal of Commerce. He died in Paris, May 4, 1890.—TONY, born in Paris, Sept. 1, 1837; studied under Delaroche; exhibited in the Salon of 1866, where his *Varsovie, April 8, 1861*, representing a massacre in the Polish War of Independence, was awarded a medal. He was given the decoration of the Legion of Honor. Among his works are *Old Women of the Place Navona, Rome*, and *The Last Day of Corinth*, both in the Luxembourg; *Charlotte Corday at Caen; Portrait of M. Robert-Fleury* and *The Billet-Doux* (1891).

ROBERTS, ELLIS HENRY, was born at Utica, New York, on September 30, 1827. From 1851 to 1880 he was editor and proprietor of the Utica *Morning Herald;* was a representative in Congress in 1871–75; assistant treasurer of the United States at New York in 1889–93, and from 1897 to 1905 was treasurer of the United States.

W.F.J.

ROBERTS, FREDERICK SLEIGH ROBERTS, LORD, English soldier, son of Sir Abraham Roberts; born at Cawnpore, India, Sept. 30, 1832; appointed lieutenant in the Bengal artillery in 1851; captain in 1860; served with distinction in the Indian Mutiny, and received the Victoria Cross; took part in the Abyssinian war in 1868 as assistant quartermaster-general, and became brevet lieutenant-colonel; in 1875 he was quartermaster-general in India, with the local rank of major-general. In the Afghan war of 1878 he commanded the column sent to operate through the Kuram valley, and, surmounting the difficulties of the Peiwar Pass, gained a brilliant victory at Charasiab and entered Kabul. On the investure of Kandahar by Ayoub Khan he rapidly performed the march from Kabul to Kandahar, one of the most brilliant military feats of modern times, and utterly defeated the pretender, Sept. 1, 1880. For these services he was created a baronet in 1881. In 1885–93 he was successor to Sir Donald Stewart in the command of the Indian army. Lord Roberts's popularity with the troops was remarkable. Familiarly known by the soldiers' sobriquet of "Little Bobs" or "Bobs Bahadur," he figures in more than one of Kipling's virile military poems. In 1892 he was raised to the peerage, and in 1895 was made Field Marshal and Commander of the Forces in Ireland. As the foremost general in the British army, and one endeared not only to the English nation but to every soldier in the ranks, he was naturally thought of by the English government for the commandership-in-chief of the British forces in South Africa in Dec. 1899, when it was determined to supersede General Sir Redvers Buller, who had met with serious reverses on the Tugela River, Natal. The acceptance of the post by Lord Roberts brought a sincere feeling of relief to the English people, and he took with him to the Cape General Lord Kitchener as head of the staff. The touch of pathos was given to the ready response of the veteran general to the government call when we consider not only Lord Roberts's advanced years, but the fact that he had just lost his only son while heroically endeavoring to save the British field batteries at Colenso "under a hurricane of leaden hail." On his arrival in South Africa, with large additions to the field force, the turning point was reached in the war, and the invasion was at once and successfully pressed into the Orange Free State and subsequently into the Transvaal. With new vigor and fresh blood, the fruits were soon seen in the relief of invested towns, in the surrounding and capture of Cronje's command, and in the ultimate annexation of the two hostile Boer republics, with the surrender or flight of the burghers, including the decamping of President Kruger and the practical close of the war. In January, 1901, Lord Roberts resigned the chief command in South Africa and returned to reap a well earned rest in England, with the honors and applause of his Queen and Country. He was made an Earl and a Knight of the Garter, and commander-in-chief of the British Army. In 1895, he published a work entitled *The Rise of Wellington*, and in 1897 there came from his vigorous pen *Forty-One Years in India.*

LORD ROBERTS.

G.M.A.

ROBERTS, HOWARD, sculptor; was born in Philadelphia in 1842, and studied at the Philadelphia Academy of Fine Arts and in Paris. In the latter city he executed several pieces of statuary, one of which, *The First Posing*, won a medal at the Philadelphia world's fair of 1876. He excelled in the making of ideal busts of women and children, and his *Hypatia; Lucile; Hester Prynne and Little Pearl*, and *Lot's Wife* have been much admired. He died in 1900. W.F.J.

ROBERTSON, GEORGE CROOM, a Scotch educator; born in Aberdeen, March 10, 1842. He was successively philosophical examiner in the Universities of London and of Aberdeen (1878–81); and in the University of Cambridge (1877–78). He was the editor of the journal *Mind* (1876–91); was the author of *Hobbes*, in Blackwood's Philosophical Classics (1887); contributed to the *Dictionary of National Biography*, and to this ENCYCLOPÆDIA several articles, among them ABELARD, ANALOGY, and ANALYSIS. Died Sept. 21, 1892.

ROBIN, CHARLES PHILIPPE, a French physician

and naturalist; born at Jasseron, department of Ain, June 4, 1821. He studied medicine in Paris. In 1847 he was made assistant professor of natural sciences on the Faculty of Medicine in Paris, and in 1862 professor of histology. He became celebrated for his microscopical researches in physiology. In 1864 he founded a journal on anatomy and physiology, in 1865 edited Nysten's *Encyclopædic Dictionary of Medicine*, and published *Cellular Anatomy and Physiology* (1873) and *A New Abridged Dictionary of Medicine* (1886). He died in Paris, Oct. 6, 1885.

ROBIN GOODFELLOW. See ROBIN HOOD, Vol. XX, p 621.

ROBINS, ELIZABETH, American actress and novelist; born in Louisville, Ky., in 1862; in 1885 married George R. Parke of Boston, who died in 1886. In 1891 and later she appeared with success in London in some of Ibsen's plays. Under the pen-name C. E. RAIMOND she has written *George Mandeville's Husband* (1894); *The New Moon* (1895); *Below the Salt* (1896); and *The Open Question* (1898).

ROBINSON, Illinois, the seat of Crawford County, a city 40 miles by rail southwest of Terre Haute, Ind., with a trade in farming and stock produce. Population, 1900, 1,683. C.L.S.

ROBINSON, BEVERLY, an American loyalist; born in Virginia in 1723. He served as major under Wolfe at Quebec, and acquired considerable wealth through his marriage with the daughter of Frederick Phillipse, the owner of a large estate on the Hudson. Though he opposed the acts of the British government which led to the Revolution, he espoused the British cause when war was declared, and, going to New York, raised the Loyal American Regiment, of which he was colonel. His country house was the headquarters of Arnold while arranging his treason. At the close of the Revolutionary war Robinson went to England with a part of his family, and died in Thornbury, England, in 1792. E.E.T.

ROBINSON, CHARLES SEYMOUR, clergyman and author, was born at Bennington, Vermont, on March 31, 1829, and was graduated from Williams College in 1849. He taught school, and in 1855 became pastor of a Presbyterian Church at Troy, N. Y. He was pastor of a church in Brooklyn, N. Y., in 1860–68, of the American chapel in Paris, France, in 1869–70, of the Memorial Presbyterian Church, New York, in 1871–87, of the Thirteenth St. Church, New York, in 1891, and of the New York Presbyterian Church, in New York, in 1892–98. Meantime he edited *The Illustrated Christian Weekly*, *Every Thursday*, and *The Christian at Work*. He published *Songs of the Church*, *Songs for the Sanctuary*, and other collections to which he contributed some original work of high character. He was also the author of other books which have had wide circulation. He died in New York on February 1, 1899. W.F.J.

ROBINSON, EZEKIEL GILMAN, educator; was born at Attleborough, Massachusetts, on March 25, 1815, and was graduated with honors from Brown University, Providence, R. I., in 1838. After studying at the Newton Theological Seminary he entered the ministry of the Baptist Church at Norfolk, Virginia, and served there for three years, being for a time chaplain of the University of Virginia. Thereafter he was a pastor at Cambridge, Massachusetts, professor of Hebrew at Covington, Kentucky, pastor in Cincinnati, Ohio, professor and president of the Rochester, New York, Theological Seminary, and in 1872 president of Brown University, also filling the chair of moral philosophy and metaphysics. His administration was highly successful, being marked with the building of the new library, the Slater Hall Dormitory, and the Sayles Memorial Hall, and the increase of the university's funds from $550,000 to more than $1,000,000. In 1889 he resigned the presidency of Brown, and afterward was a lecturer at Crozer Theological Seminary. He was the author of a number of theological works. He died on June 13, 1894. W.F.J.

E. G. ROBINSON.

ROBINSON, SIR FREDERICK PHILLIPSE, soldier; son of Beverly Robinson (q.v., supra), was born in New York in 1763, and in his boyhood followed his father into the ranks of the British army. He was among those captured by Wayne at Stony Point, and, upon being released through exchange, quitted the country and went to England. He afterward served in the West Indies and under Wellington in Portugal and Spain. In the War of 1812 he was in command of the British army in Ontario, and in 1815 was made governor of that province and was knighted. Later he was commander-in-chief in the West Indies, a lieutenant-general in 1825 and general in 1841. He died on January 1, 1852. W.F.J.

ROBINSON, SIR HERCULES GEORGE, afterward LORD ROSMEAD, diplomat and administrator; was born in England on December 19, 1824, and was educated at Sandhurst. He was president of the council in Montserrat in 1854, lieutenant-governor of St. Kitts in 1855, governor of Hong Kong in 1859, governor of Ceylon in 1865, governor of New South Wales in 1872, governor of New Zealand in 1878, and governor of Cape Colony in 1880, and again in in 1895. He annexed the Fiji Islands to the British Empire in 1874. He was made a Knight of St. Michael and St. George in 1875, a baronet in 1890, and a peer, as Baron Rosmead, in 1896. He died on October 28, 1897. W.F.J.

ROBINSON, PHILIP STEWART, author and journalist; was born of English parents at Chunar, India, in 1849, and was educated at Marlborough College. He became assistant to his father, the editor of the *Pioneer* at Allahabad, India, and filled two college professorships. He was a correspondent of the London *Daily Telegraph* in

the Afghan War of 1878 and the Egyptian War of 1882, and afterward was a correspondent of the New York *World* and the *Pall Mall Gazette*. His books include *In My Indian Garden* (1878); *Under the Punkah* (1881); *Noah's Ark* (1882); *The Poet's Birds* (1883); *Sinners and Saints* (1883); *Chasing a Fortune* (1885); *The Poet's Beasts* (1885); *Tigers at Large* (1885); *The Valley of Teetotum Trees* (1886); *Some Country Sights and Sounds* (1893); *Birds of the Wave and Woodland* (1894), and *In Garden, Orchard and Spinney* (1897). W.F.J.

ROBINSON, Stuart, theologian; was born in Ireland on November 26, 1816, was educated at Amherst College, and at Princeton Theological Seminary, was ordained into the Presbyterian ministry in 1841, and became a preacher and teacher in Virginia and Kentucky. In the Civil War he came into conflict with the United States Government, and his paper, the *True Presbyterian*, was suppressed for treason. He thereupon went to Canada, where he preached and published a book in championship of slavery as a divinely appointed institution. Returning to Kentucky after the war, he continued his advocacy of the "Lost Cause," with the result that he was expelled from the local Presbytery and from the General Assembly of the Presbyterian Church. He thereupon identified himself with the Southern General Assembly. He died on October 5, 1881. W.F.J.

ROBINSON, Therese Albertina Louise (von Jakob), a German-American authoress; born in Halle, Jan. 26, 1797. For nine years she resided in Russia with her father, and upon her return published translations into German of Sir Walter Scott's *Old Mortality* and *Black Dwarf*. In 1828 she married Professor Edward Robinson (q.v., Vol. XX, p. 622), and went with him to America. Here she contributed to the *North American Review* and the *Biblical Repository*, the latter of which her husband edited. After her husband's death Mrs. Robinson lived in Hamburg, Germany. She published books in both German and English, under the pseudonym Talvj, an anagram of the initals in her maiden name. Among her works in German are *Volkslieder der Serben* (1826); *Die Unechtheit der Lieder Ossians* (1840); and *Die Colonisation von New England* (1847); among those in English, *Woodhill: or, the Ways of Providence* (1856); *Historical View of the Language and Literature of the Slavic Nations* (1850); and a posthumous work, entitled *Fifteen Years* (1870). She died in Hamburg, April 13, 1869.

ROBINSON CRUSOE. See Defoe, Vol. VII, p. 24.

ROB ROY, the pseudonym of MacGregor, John. (q.v., in these Supplements.)

ROBSON, Stuart, actor; was born at Annapolis, Maryland, on March 4, 1836, and went upon the stage in 1852. He became a member of Laura Keene's company, was afterward a member of A. M. Palmer's company, and was a partner of William H. Crane in many productions. He died on April 29, 1903. W.F.J.

ROBY, Henry John, educator; was born at Tamworth, England, on August 12, 1830, and was educated at St. John's College, Cambridge, where he became a fellow in 1854. He has been a lecturer at Cambridge; under-master of Dulwich College; professor of jurisprudence at University College, London, and a commissioner of endowed schools. He was for many years a cotton manufacturer, and in 1890–95 a Gladstonian member of Parliament. He is the author of *Remarks on College Reform; Grammar of the Latin Language; Introduction to Justinian's Digest*, and *Roman Private Law in the Times of Cicero and the Antonines*. He is an honorary LL. D. of Cambridge and Edinburgh. W.F.J.

ROCAMBOLE. See Horticulture, Vol. XII, pp. 299, 300.

ROCHAMBEAU, Jean Baptiste Donatien de Vimeure, Count of, a French general; born in Vendôme, July 1, 1725. He was educated for the priesthood, but, upon the death of his elder brother, entered the army in 1742. In 1749 he succeeded his father as governor of Vendôme, and served in the Seven Years' War, attaining the rank of brigadier. In 1780 he was made lieutenant-general, and put in command of the French troops sent to aid the American Revolutionists. He landed in Rhode Island and established his headquarters at Newport. In June, 1781, he marched toward the Hudson, defeated a detachment of Clinton's army on Manhattan Island, joined Washington's army and took part in the siege of Yorktown. After the close of the war he returned to France; was a deputy to the Assembly of Notables in 1788; repressed the riots in Alsace in 1790, and was created field-marshal in the following year; commanded the Army of the North, but resigned in 1792; was imprisoned in 1793; and owed his life to the fall of Robespierre. In 1804 he was created grand officer of the Legion of Honor. He died May 10, 1807. His *Memoirs*, written at his dictation, were published in 1809 in Paris, and translated into English by William E. Wright in 1838.

ROCHE, James Jeffrey, an American journalist; born in Mountmellick, Ireland, May 31, 1847. He went to Prince Edward's Island in infancy, and was educated at St. Dunstan's College, Charlottetown. He engaged in commercial pursuits in Boston from 1866 to 1883, and was assistant editor of *The Pilot* from 1883 to 1890, under John Boyle O'Reilly, on whose death he succeeded to the editorship of the paper. He was appointed a member of the Boston Metropolitan Park Commission in 1893. He is the author of *Songs and Satires* (1886); *Life of John Boyle O'Reilly* (1891); *The Story of the Filibusters* (1891); *Ballads of Blue Water* (1895); *Her Majesty the King* (1898); *By-Ways of War;* etc. E.E.T.

ROCHEFORT, Victor Henri, Count of Rochefort-Lucay, journalist and political agitator; was born in Paris on July 29, 1832, a member of an ennobled family, from which he dissociated himself, preferring to pose as "one of the people." He became a clerk under the mu-

nicipal government, but was dismissed for indolence and neglect of duties. Thereupon he began political agitations against the government. In 1868 he founded and edited *La Lanterne*, a seditious paper of sensational tone, which was soon suppressed by the police, and he fled to Brussels to avoid arrest. In 1869, however, he returned, having been elected to the Chamber of Deputies, and started *Le Marseillaise*, in which he renewed his attacks upon the Imperial government, though with more dignity than before. Upon the cowardly and brutal murder of one of his staff, Victor Noir, by Prince Pierre Bonaparte, however, he was so outspoken that he was imprisoned and the paper was suppressed. Upon the fall of the empire in 1870 he came to the fore, and in 1871 was elected to the National Assembly. There he made himself the Communist leader, and he published *Le Mot d' Ordre* as a Communist journal. Upon the fall of the Commune he tried to flee, but was intercepted by the Germans and handed over to the French Government, which exiled him to New Caledonia for life. He escaped in 1874, and returned to France after the amnesty of 1880. He showed himself, however, as irreconcilable and as impracticable as ever, and in his new paper, *L'Intransigeant*, was rabidly bitter against the Republican government. He was a member of the Chamber of Deputies in 1885–86, and might have commanded some leadership there, with his undoubted abilities; but instead he threw himself away in the sordid and pinchbeck Boulanger conspiracy. Upon the collapse of that wretched affair he fled to England to find asylum, but was permitted to return to France in 1895, his influence and his power for harm to the republic being quite destroyed. He has written a highly entertaining book, entitled *The Adventures of My Life*, which was translated into English in 1896. Despite his eccentricities and frequent brutalities, he is a man of artistic tastes and of high talent as a writer and as a connoisseur of art, and has the personal traits of the aristocrats whom he affects to despise. W.F.J.

HENRI ROCHEFORT.

ROCHELLE, a city of Ogle County, northwestern Illinois, 73 miles W. of Chicago and 25 miles S. of Rockford, on the Chicago and North-Western and the Chicago, Burlington and Quincy railroads. It manufactures disk harrows, tile and bricks, barbed wire and oatmeal. The surrounding country is devoted to farming. Population, 1900, 2,073.

ROCHESTER, Minnesota, the seat of Olmsted County, a city on the Zumbro River, and a junction for divisions of the Chicago and Northwestern and the Winona and Western railroads, 90 miles south of St. Paul. It has many fine buildings, including the Roman Catholic Academy of Notre Dame de Lourdes. Farming and cattle-raising supply an active export trade in grain, wool and horses; other products include those of mills and factories, with an output of flour, clothing, machinery, etc. Population, 1890, 5,321; 1900, 6,843. C.L.S.

ROCHESTER, Indiana, the seat of Fulton County, a town in the valley of the Tippecanoe River, 95 miles north of Indianapolis, on the Chicago and Erie, and the Lake Erie and Western railroads. It is in a farming section, exporting its produce and having some manufactures. Population, 1900, 3,421. C.L.S.

ROCHESTER, New Hampshire, a manufacturing city and railway junction of Strafford County on four divisions of the Boston and Maine railroad, 78 miles north of Boston, Mass. The Cocheco River and Salmon Falls supply power to numerous mills and factories producing woolens, leather, shoes, machinery, bricks, etc. Population, 1890, 7,396; 1900, 8,466. C.L.S.

ROCHESTER, a city of New York, is on the New York Central and Hudson River, the Rochester division of the Erie, the Northern Central, the Buffalo, Rochester and Pittsburg and other railroads.

Rochester has 2,616 manufacturing establishments, employing 36,687 people. The value of its manufactured products per annum is $69,129,820. The capital invested in manufacturing and the wholesale trade amounts to $49,086,212. For many years Rochester's development was slow, but during the last two decades the city took a tremendous stride forward. The manufacture of men's clothing is its chief industry. There has been a rapid extension of the limits of the manufacturing district, and the establishment of large factories in places remote from the river-banks. East Rochester has developed into a thriving manufacturing section, with a number of large plants. Some of Rochester's finest public buildings are the courthouse, city hall and Free Academy, in the heart of the town, the Government Building and the State Arsenal, with the Soldiers' Monument in front of it, the Lyceum Theater and the Eureka Club-house.

The general improvement of the city has of late years been very marked. The artistic side of life has not been neglected, and while, like many comparatively new cities, the streets of Rochester are noticeably bare of statuary, in the Powers Art Gallery a really valuable selection of paintings and *objets d'art* has been gathered. The collection is valued at upward of one million dollars. The number of paintings in the collection is nearly one thousand, while numerous superb examples of statuary, with expensive bric-à-brac and rare vases, add to the attractions of the gallery.

The assessed valuation of Rochester in 1900 was: Real estate, $106,847,720; personal estate, $9,100,430, bonded indebtedness, $10,366,578; civic expenditure, $2,542,170, education, $654,450. Pop. 1900, 162,435. See ROCHESTER, Vol. XX, p. 629.

ROCHESTER, Pennsylvania, a town of Beaver County, at the junction of the Beaver River with the Ohio, 26 miles northwest of Pitts-

burg, on the Pennsylvania lines. It has gas and oil wells, coal mines, and various manufactures. Population, 1890, 3,649; 1900, 4,688. C.L.S.

ROCHESTER UNIVERSITY is a Baptist institution. It opened for students in 1850 and instructed seventy-one men, graduating ten in 1851, in which year the charter was granted. It occupies grounds of 20 acres, forming a beautiful park. Anderson Hall, containing chapel, lecture-rooms and laboratories, Sibley Hall, with the library and museums, the Reynolds Memorial Laboratory, are the chief buildings. The Alumni

ANDERSON HALL, UNIVERSITY OF ROCHESTER.

gymnasium is well equipped. Candidates are examined in classics, science and history. There are three courses, the classical, the scientific and the philosophical; comprising rhetoric, elocution, English, Greek, Latin, Sanskrit, French, German, Spanish, Italian, mathematics, science, politics, philosophy, art and Biblical literature. There are also courses for the degree of M.A. Since 1900 women have been admitted on the same conditions as men. There are many scholarships, some for women. Expenses $236 per annum. W.R.B.

ROCHET, LOUIS, a French sculptor; born Aug. 24, 1813, in Paris. He studied under Pierre Jean David, and began to exhibit in 1835. His works include *Compte Ugolino et ses Enfants; Jeune Femme Pleurant; Napoléon Bonaparte;* the large equestrian statue of *Dom Pedro I,* erected at Rio de Janeiro in 1862; the statue of *Marshal Drouet* in the Versailles Museum; and of *Madame de Sévigné.* He died Jan. 21, 1878.

J. D. ROCKEFELLER.

ROCK-CHUTE SYSTEM. See COAL, in these Supplements.

ROCK-CRYSTAL. See MINERALOGY, Vol. XVI, p. 405.

ROCKEFELLER, JOHN DAVIDSON, an American capitalist; born in Richford, Tioga County, New York, July 8, 1839. At an early age he removed with his parents to Cleveland, Ohio; was educated in its public schools, and later employed by the firm of Hewitt and Tuttle in that city until he was 19, when he entered business on his own account. He evinced great aptitude for affairs, and from very small beginnings soon began to get rich. In 1860, when petroleum discoveries created the "oil fever," he was proprietor of a refinery in Cleveland with a modest capital. His business developed until he became president of the Standard Oil Company, a monopolistic corporation formed in 1870, through which he became enormously rich. He gave $23,000,000 to the Chicago University; $43,000,000 to the General Education Board, and large sums to other institutions, amounting to over $85,000,000.

ROCKET OR HESPERIS. See HORTICULTURE, Vol. XII, p. 258.

ROCK FALLS, Illinois, a city of Whiteside County on the Rock River, and on the Chicago, Burlington & Quincy railroad, 110 miles west of Chicago. The river and falls provide abundant water power for flouring and paper mills, foundries, agricultural implement and tool factories. Population, 1900, 2,176. C.L.S.

ROCK-FISH OR ROCK, the *Roccus lineatus,* a fish abundant in northern United States. In New York it is called striped bass because of the longitudinal dark-colored bands on the sides of the body. It is essentially marine, but it ascends rivers sometimes to perfectly fresh water. It is one of the finest food-fishes. On the California coast the name is inappropriately given to two species of *Sebastes,* which are very abundant, and excellent food-fishes. See also CALIFORNIA, Vol. IV, p. 623.

ROCKFORD, a city and the capital of Winnebago County, in the state of Illinois. The census of 1900 showed the following: 450 manufacturing establishments, with a combined capital of $14,126,834, employing 7,076 persons, paying $3,188,256 for wages and $6,659,240 for materials, having their products valued at $12,586,116. The manufacture of agricultural implements, furniture, and hosiery and knit goods are the chief industries. Population 1890, 23,584; 1900, 31,051. See also ROCKFORD, Vol. XX, p. 631.

ROCKHAMPTON, a seaport city of Queensland. Vessels of 1,500 tons come up to the wharves, while larger ships land at Port Alma, 36 miles below. The surrounding country has gold, silver and copper. Peak Downs and Mount Morgan are the two most important workings. Population 1901, 19,691. See also ROCKHAMPTON, Vol. XX, p. 631.

ROCKHILL, WILLIAM WOODVILLE, diplomat; was born in Philadelphia, Pennsylvania, in 1854. He was second secretary of the American Legation at Peking in 1884, first secretary in 1885, and *chargé de affaires* in Corea in 1886–89, made two journeys of exploration in China, Mongolia and Tibet in 1888–92, was chief-clerk of the state department in 1893–94, third Assistant-Secretary of State in 1894–95, first Assistant-Secretary of State in 1896–97, minister to Greece, Roumania and Servia in 1897–99, commissioner to China in 1900, plenipotentiary to the Congress of Peking in 1901, director of the Bureau of American Republics in 1899–1905, and in March, 1905, was appointed minister to China. W.F.J.

ROCKINGHAM, a village and the capital of Richmond Co., southwestern North Carolina, 33

miles S.W. of Raleigh, on the Seaboard Air Line and the Richmond and Danville railroads. It has an academy and a cotton-mill. Population 1900, 1,507.

ROCKINGHAM, a town and capital of Windham County, southeastern Vermont, on the Williams River, and 29 miles S. of Woodstock, on the Central Vermont railroad. It contains three paper-mills and two woolen-mills; also a cotton-mill. Pop. (including Bellows Falls), 1900, 5,809.

ROCK ISLAND, a city and the capital of Rock Island County, northwestern Illinois, on the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific and the Rock Island and Peoria railroads. It has manufactures of agricultural implements, window-glass and cotton goods. Augustana College (Lutheran), located here, is a co-educational institution, founded in 1860, and had, in 1904, 40 instructors, 534 students, and a library containing 18,000 volumes. Pop. 1890, 13,634; 1900 (12th census), 19,493. See ROCK ISLAND, Vol. XX, p. 631.

ROCKLAND, Maine, the seat of Knox County, a seaport city on the west shore of Penobscot Bay and on the Maine Central railroad 90 miles northeast of Portland. It is an important transit station for numerous coastwise steamers. See ROCKLAND, Vol. XX, p. 631. Population, 1890, 8,174; 1900, 8,150. C.L.S.

ROCKLAND, Massachusetts, a town of Plymouth County, 18 miles southeast of Boston, on the North Abington and Hanover division of the New York, New Haven & Hartford railroad. It is a manufacturing center, chiefly of shoes. Population, 1890, 5,206; 1900, 5,327. C.L.S.

ROCKPORT, a village and the capital of Spencer County, southwestern Indiana, 28 miles E. of Evansville, on the Louisville, Evansville and St. Louis railroad. It has basket, chair and furniture factories; also flour and lumber mills. Extensive coal-mines are here. The village is surrounded by the most extensive tobacco-growing district of the state. Population 1890, 2,314; 1900, 2,882.

ROCKPORT, Massachusetts, a seaport town and summer resort on Cape Ann, in Essex County, at the head of Pigeon Cove Bay, and the terminus of a branch line of the Boston and Maine railroad, 32 miles northeast of Boston. It has large shipping, fishing, granite, quarrying and manufacturing industries. Population, 1890, 4,087; 1900, 4,592. C.L.S.

ROCKPORT, Texas, the seat of Aransas County, a seaport town on Aransas Bay, an inlet of the Gulf of Mexico, 170 miles southwest of Galveston, on the San Antonio and Aransas Pass railroad. It trades in market produce, game and fish. Population, 1900, 1,153. C.L.S.

ROCK RAPIDS, a village and the capital of Lyon County, in northwestern Iowa, 56 miles N.W. of Cherokee, on the Burlington, Cedar Rapids and Northern and the Chicago, St. Paul, Minneapolis and Omaha railroads. This place is situated in a farming district, and has flour-mills and grain-elevators. Population 1890, 1,394; 1900, 1,766.

ROCK ROSE, a name given in general to species of the family *Cistaceæ*, but particularly to the showy *Cistus ladaniferus* of Europe. The American representatives are species of *Helianthemum* (frostweeds), *Hudsonia* and *Lechea* (pinweeds), all of sandy woods and fields.

ROCKS. See GEOLOGY, Vol. X, pp. 204–214.

ROCK-SNAKE. See PYTHON, Vol. XX, p. 150.

ROCK SPRINGS, a town of Sweetwater County, in southwestern Wyoming, on Bitter Creek, and on the Union Pacific railroad. This place is known principally as a coal-mining region, there being here several beds of good lignite 9 to 14 feet thick. The various mines employ over twenty-five hundred men. Population 1890, 3,406; 1900, 4,363.

ROCKSTRO, WILLIAM SMYTH, an English pianist, musical composer, author and teacher; born in 1830. He arranged and edited various classical operas and was known as a voluminous composer of salon pieces, such as *Christabel*, and others. His other works include *Abbey Lands: A Tale* (1857); *The Choristers of St. Mary's* (1858); *A History of Music* (1879); *Practical Harmony for Students* (1879); *The Life of George Frederick Handel* (1883); *Mendelssohn* (1883); *A General History of Music from the Infancy of the Greek Drama to the Present Period* (1886). He wrote many articles for this ENCYCLOPÆDIA, including MENDELSSOHN, MOZART, PLAIN SONG, WAGNER, RICHARD WEBER, etc.

ROCKVILLE, a city of Tolland County, northern Connecticut, 12 miles W. of Tolland and 22 miles E.N.E. of Hartford, on the Central Vermont railroad. The more important industries are paper, woolen, silk and cotton mills. Population 1900, 7,287.

ROCKVILLE, a village and the capital of Park County, western Indiana, 55 miles W. of Indianapolis, on the Chicago and Eastern Illinois railroad. It has a graded school, an iron-foundry and woolen and flour mills. Coal is found in this vicinity Population 1890, 1,689; 1900, 2,045.

ROCKVILLE, a village and the capital of Montgomery County, central Maryland, 14 miles N. of Washington, District of Columbia, on the Baltimore and Ohio railroad. It is in an agricultural district, and has a courthouse, a jail and a weekly paper. Population 1900, 1,110.

ROCKWOOD, Tennessee, a town and railroad junction of Roane County, 45 miles west southwest of Knoxville, on three lines of railroads, exporting the products of its extensive iron, coal-mining, and industrial establishments. Population, 1900, 2,899. C.L.S.

ROCKY MOUNTAIN GOAT (*Haplocerus montanus*), a true antelope which inhabits the mountains from Colorado to British Columbia. Its hair is white, and a beard on the throat gives some resemblance to a goat. It is the only American form, but allied forms are found in southern Asia. See also ANTELOPE, Vol. II, p. 91.

ROCKY MOUNTAIN SHEEP, a name sometimes given to the big-horn (*Ovis montana*). It ranges from the Mexican boundary to Alaska. The animal is very active, and its flesh is excellent food. See also SHEEP, Vol. XXI, p. 821.

RODENTIA OR GLIRES. See MAMMALIA, Vol. XV, pp. 421–427.

RODGERS, CHRISTOPHER RAYMOND PERRY,

naval commander; was born in Brooklyn, New York, on November 14, 1819, son of Commodore G. W. Rodgers and nephew of Commodore Perry. He entered the navy in 1833, commanded a schooner in the Seminole War, and was active in the Mexican War. In the Civil War he distinguished himself with the frigate *Wabash* at Port Royal, led an expedition to St. Augustine and up the St. Mary's River, was conspicuous at the capture of Fort Pulaski, and was fleet-captain in the attack upon Charleston in 1863. After the war he was on foreign service, chief of the Bureau of Docks and Yards, commandant of the Naval Academy, and commander of the naval forces in the Pacific. He was made rear-admiral in 1874, retired in 1881, and died on Jan. 8, 1892. W.F.J.

RODGERS, John, naval commander, member of a family illustrious in American naval annals; was born in Maryland on August 8, 1812, and entered the navy in 1828. He served in South American waters, in the Seminole War, and in coast survey work. In 1861 he had charge of the building of ironclads, in 1862 commanded the *Galena* and led a squadron up the James River, in 1863 commanded the monitor *Weehawken* and defeated the ironclad *Atlanta*, for which he received the thanks of Congress, and in 1864–65 commanded the *Dictator* on special service. In 1867 he took the monitor *Monadnock* around Cape Horn to San Francisco. Thereafter he commanded at the Boston navy yard, was in charge of the Asiatic squadron and did effective work for the protection of American interests in Corea, and was superintendent of the Naval Observatory at Washington, and succeeded Joseph Henry at the head of the Lighthouse Board. He died on May 5, 1882. W.F.J.

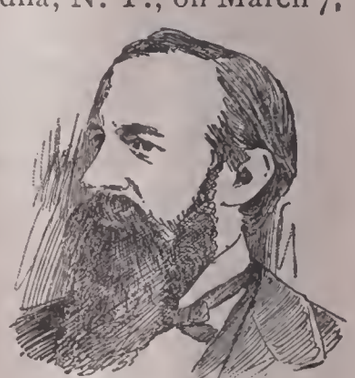
RODIN, Auguste, sculptor; was born in Paris in 1840, and studied in the ateliers of Barye, Carrier Belleuse, and Van Rasbourg, from 1864 to 1877. He has produced many noteworthy works, among which are *L'Homme au Nez-Casse* (1864); *L'Age d'Airain* (1877); *St. Jean Prêchant* (1882); *The Creation of Man* (1882); busts of *Jean Paul Laurens*, *Carrier-Belleuse*, *Victor Hugo*, *Antonin Proust*, and *Dalou* (1882–85); busts of *Puvis de Chavannes*, *La Cariatide*, *La Danaide*, *La Pensee*, *Balzac*, *Le Baiser*, *l'Eve*, and a monument to *Victor Hugo;* busts of *Falguiere*, *Rochefort*, *Octave Mirabeau*, etc.; *Les Bourgeois de Calais* (1889); *La Porte d'Enfer; Le Frere et la Sœur; Le Printemps; L'Eternelle Idole; La Guerre; Psyche; Amor Fugit*, etc. W.F.J

RODMAN, Thomas Jefferson, soldier; was born at Salem, Indiana, on July 30, 1818, and was graduated from West Point in 1841. He served creditably in the Mexican War, but soon showed such talents in the devising of guns and ammunition that he was detailed exclusively to such duties. In 1860 he constructed his huge fifteen-inch cannon, and his mammoth powder and cake powder, the last named being quickly adopted throughout the world. These devices proved to be of great value to the Government in the Civil War, and were widely used in both army and navy. Most of his work was done in the arsenals at Pittsburg, Pennsylvania, at Watertown, Connecticut, and at Rock Island, Illinois, at which last named place he was in command from 1865 to his death. He rose to the brevet rank of brigadier-general, and died on June 7, 1871. W.F.J.

RODNEY, Cæsar, statesman; was born at Dover, Delaware, on October 7, 1728, and filled many local offices, civil and military. He was a delegate to the Stamp Act Congress of 1765, and a signer of the address to the king in 1769. In 1774 he was sent to the Continental Congress and was a prominent member of that body. He was one of the signers of the Declaration of Independence, and thus so offended the Tories of Delaware that he failed of re-election to Congress. He was a brigadier-general of militia, and did some good work in the war. He was president of Delaware in 1778–81, and was elected to Congress in 1782, but because of ill health failed to attend the session. He died of cancer on June 20, 1784. W.F.J.

RODNEY, Cæsar Augustus, statesman, son of Cæsar Rodney; was born at Dover, Delaware, on January 4, 1772, was graduated from the University of Pennsylvania in 1789, and in 1803 began the practice of the law. He was a Representative in Congress in 1805–07 and was concerned in the impeachment of Judge Chase; U. S. attorney-general in 1807–12; captain of a company of artillery in the War of 1812, and in 1815 a member of the Delaware State Senate. He was one of the commissioners sent to South America in 1817 to determine the fitness of the revolutionary republics for recognition, and made a report in 1819 in their favor. He was in Congress in 1821–22, in the Senate in 1822–23, and first minister to Buenos Ayres in 1823–24. He died on June 10, 1824. W.F.J.

ROE, Edward Payson, clergyman and author; was born at Moodna, N. Y., on March 7, 1838, studied at Williams College and Auburn and Union Theological Seminaries, and was chaplain in the Civil War. He was pastor of a Presbyterian Church at Highland Falls, N. Y., for a number of years, and then devoted himself almost exclusively to authorship. His first novel, *Barriers Burned Away*, was suggested by the great fire in Chicago. His other works included *Near to Nature's Heart*, *The Opening of a Chestnut Burr*, *A Knight of the Nineteenth Century*, *A Face Illumined*, *A Day of Fate*, and *His Sombre Rivals*. He was a practical gardener, and wrote *Pay and Profit in My Garden*, and *Success with Small Fruits*. He died at Cornwall, N. Y., on July 19, 1888. W.F.J.



E. P. ROE.

ROEBLING, Washington Augustus, en-

gineer, son of John A. Roebling (q.v., Vol. XX, p. 635); was born at Saxonburg, Pennsylvania, on May 26, 1837, and was graduated from the Rensselær Polytechnic Institute in 1857. He was associated with his father in the construction of the suspension bridge at Pittsburg, served in the Federal army in the Civil War and rose to the rank of colonel, and was again associated with his father in building the suspension bridges at Cincinnati and Brooklyn. The latter was scarcely begun when the elder Roebling died, and the son was entrusted with its construction. He carried it to successful completion, making it one of the modern wonders of the world. He has since been at the head of a great manufactory of wire and wire rope, at Trenton, N. J. W.F.J.

ROE-DEER. See DEER, Vol. VII, p. 23.

ROENTGEN RAYS OR RÖNTGEN RAYS AND PHOTOGRAPHY. See ELECTRICITY, §96, and PHOTOGRAPHY, in these Supplements.

ROGERS, HENRY DARWIN, geologist; was born in Philadelphia, Pennsylvania, on August 1, 1808, the son of an eminent scientist. He became professor of chemistry and natural philosophy in Dickinson College, Carlisle, Penn., in 1831, and was for a number of years state geologist of Pennsylvania and New Jersey, and made surveys and published reports and maps of those states. In 1858 he was appointed regius professor of natural history in the University of Glasgow, Scotland, and filled that place with distinction for the remainder of his life. While there he completed, in 1861, a fine *Geological Atlas of the United States*. He died at Glasgow on May 29, 1866. W.F.J.

ROGERS, HENRY WADE, educator; was born at Holland Patent, New York, on October 10, 1853, and was graduated from the University of Michigan in 1874. He was admitted to the bar in 1877, became professor in the law school of the University of Michigan in 1883 and its dean in 1885–90; was president of Northwestern University, Evanston, Ill., in 1890–1901, and since 1901 has been professor in, and since 1904 dean of, the law school of Yale University. He has written several treatises on law. W.F.J.

H. W. ROGERS.

ROGERS, JAMES BLYTHE, an American chemist and physician; born in Philadelphia, Pa., Feb. 11, 1802. He graduated at William and Mary College, Va., studied medicine, and practised for a short time. He became superintendent of a chemical works in Baltimore, and later professor of chemistry in the Washington Medical College, there. In 1835 he took a similar position in the medical department of Cincinnati College, which he held for four years. In 1840 he removed to Philadelphia, where he lectured on chemistry in the Philadelphia Medical Institute, the Franklin Institute, and the Franklin Medical College. In 1847 he became professor of chemistry at the University of Pennsylvania. He was a member of the Franklin Institute, the American Philosophical Society, and the Academy of Natural Sciences. He died in Philadelphia, June 15, 1852. E.E.T.

ROGERS, JAMES EDWIN THOROLD, economist; was born in England in 1823, and became professor at Oxford, but is most remembered as the historian of economics. His chief work was *The History of Agriculture and Prices in England* (1866–68), which has been abridged into *Six Centuries of Work and Wages* (1885). He also wrote *Cobden and Modern Political Opinion* (1873); *The First Nine Years of the Bank of England* (1887); the *Economic Interpretation of History* (1888), and *The Industrial and Commercial History of England* (1892). He died on October 12, 1900. W.F.J.

ROGERS, JOHN, an American sculptor; born in Salem, Mass., Oct. 30, 1829. He received a common-school education, and worked as a machinist in Manchester, N. H.; in his leisure time making experiments in modelling. At the age of 28 he went to Paris and Rome to study art, and shortly after his return exhibited his statuette group, *The Checker Players*, which attracted considerable attention. His next group, *The Slave Auction*, exhibited in 1860, gave him a still wider reputation, and he established a studio in New York. Among his best-known groups are *The Picket Guard; One More Shot!; The Union Refugees; The Wounded Scout; Uncle Ned's School; How the Fort Was Taken; Taking the Oath; The Fugitive's Story; The Council of War; The Landing of the Norsemen;* and illustrations of *Rip Van Winkle*, and *The Legend of Sleepy Hollow*, etc. His larger statues include that of John F. Reynolds, in Philadelphia; and that of Abraham Lincoln, exhibited at the World's Fair, Chicago. He died in New Canaan, Connecticut, July 27, 1904. E.E.T.

JOHN ROGERS.

ROGERS, RANDOLPH, an American sculptor; born in Waterloo, N. Y., July 6, 1825. He studied in Rome under Bartolini; and lived in New York, 1850–55, exhibiting several works which gave him a wide reputation, among which are *Nydia; A Boy and a Dog; Isaac;* and *The Lost Pleiad*. After 1855 he settled in Rome. Among his most important works are the bronze doors of the extension of the Capitol at Washington; the completion of the Washington monument at Richmond, Va., begun by Crawford; the statue of John Adams at Mount Auburn Cemetery; the *Angel of the Resurrection* on the Colt

monument at Hartford; a memorial monument representing Michigan, at Detroit; a statue of Pres. Lincoln, at Philadelphia; that of W. H. Seward, in New York; the *Genius of Connecticut*, on the Capitol at Hartford; and a bronze group of Indians. He died in Rome, Jan. 15, 1892. E.E.T.

ROGERS, William Barton, an American physicist and geologist; born in Philadelphia, Pa., Dec. 7, 1804. He graduated at William and Mary College in 1822; kept a private school in Baltimore; was professor of natural philosophy and chemistry at William and Mary College; became professor of natural philosophy at the University of Virginia in 1835; and was head of the geological survey of Virginia, 1835–42. In 1853 he resigned his professorship and removed to Boston, where he was one of the founders of the Massachusetts Institute of Technology, of which he became president in 1862 and also professor of physics and geology. He resigned his position in 1870, but resumed it in 1878. He died in Boston, May 30, 1882. E.E.T.

ROGERSVILLE, Tennessee, the seat of Hawkins County, a town on the southeastern base of the Clinch Mountains, and the terminus of a division of the Southern railroad, 54 miles northeast of Knoxville. It is the seat of the Synodical (Presbyterian) Female College and of McMinn Academy. Its industrial interests are agricultural. Population, 1890, 1,153; 1900, 1,386. C.L.S.

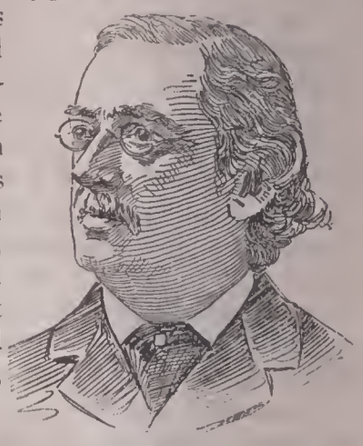
ROGUE RIVER. See Oregon, Vol. XVII, 846.

ROHLFS, Anna Katherine Green, novelist; was born at Brooklyn, N. Y., on November 11, 1846, and was graduated from Ripley College, Poultney, Vermont. She has written a number of "detective" stories of merit, including *The Leavenworth Case* (1878); *The Sword of Damocles; The Mill Mystery; Dead Man's Lane; A Strange Disappearance; That Affair Next Door; Hand and Ring; X. Y. Z.*, and *Behind Closed Doors*. She has also written a dramatic poem entitled *Risifi's Daughter* (1866). W.F.J.

ROHLFS, Gerhard, a German-African explorer; born at Vegesack, April 14, 1831. He studied medicine, and served as surgeon in the French campaigns of 1855–60. In 1860 he explored Morocco and Fez, and, in 1862, the oasis of Tafilet. In 1863 he traveled from Tangier to Tuat, and in 1865 from Tripoli to the Chad Lake and the coast of Guinea. In 1867 he took part in the English expedition to Abyssinia, and explored, from 1873–74, the Lybian Desert. In 1878 he visited the oasis of Kufra, starting from Tripoli, and in 1880 the capital of King Johannes of Abyssinia. In 1884 he was appointed consul-general and imperial commissioner at Zanzibar, returning in 1885 to Germany, where he died at Rüngsdorf, June 2, 1896. He wrote *Land und Volk in Afrika* (1870); *Beiträge zur Entdeckung und Erforschung Afrikas* (1876); *Reise von Tripolis nach der Oase Kufra* (1881). G.A.S.

ROLF. See Rollo, Vol. XX, p. 643.

ROLFE, William James, an American scholar; born in Newburyport, Mass., Dec. 10, 1827. He received his education at the Lowell high school and at Amherst College, where he graduated in 1849. From 1852 to 1868 he was headmaster in the high schools of Dorchester, Lawrence, Salem, and Cambridge, Mass., but since then has devoted himself to editorial work, literary criticism (especially of Shakespeare), and authorship. He received the degree of Master of Arts from Harvard in 1859, and from Amherst in 1865, and that of Doctor of Letters from Amherst in 1887. He is the editor of *Craik's English of Shakespeare* (1867); *Complete Edition of Shakespeare*, 40 volumes (1870–83); *Complete Edition of Scott's Poems* (1887); *Minor Poems of Milton* (1887); *Macaulay's Lays of Ancient Rome* (1888); *Rolfe's Students' Series of Standard English Poems* (1882–87); *Mrs. Browning's Sonnets from the Portuguese* (1886); *Select Poems of Robert Browning* (1886); *Select Dramas of Robert Browning* (1887); *Tales of Chivalry* (1887); *Tales from English History* (1888); *Fairy Tales* (1889); *Tales from Scottish History* (1891); *Lamb's Tales from Shakespeare* 2 vol. (1892); a *Complete Edition of Tennyson*, 12 volumes (1895–98), and the Cambridge edition of the same in one volume (1899); *Shakespeare the Boy* (1896); *Life of Shakespeare*, published as Vol. 22 of the New Century edition of Shakespeare (1902). He is also a frequent contributor to reviews and magazines. E.E.T.



WILLIAM J. ROLFE.

ROLLA, Missouri, the seat of Phelps County, a city on the St. Louis & San Francisco railroad, 50 miles southeast of Jefferson City. It is the seat of the State School of Mines and Metallurgy, and has iron-mining and flour-milling industries. Population, 1900, 1,600. C.L.S.

ROLLIT, Sir Albert Kaye, publicist; was born at Hull, England, in 1842, and was educated at King's College and the University of London. He became a lawyer and was president of the Incorporated Law Society in 1863. He was knighted in 1885, and has been a member of Parliament since 1886. He has filled many places in chambers of commerce and similar organizations, has done much for the promotion of commercial interests, and has received many honorary degrees and knightly decorations. W.F.J.
